A most important matter very often overlooked, is the providing of good protective starting equipment for motors of smaller size than those provided with an auto-starter. This refers to motors under 7½ h.p. A very large proportion of trouble which has occurred from time to time with motors under 7½ h.p., has been found due to single phase operation, and the motor afterwards burnt out when really the windings were not defective, and suitable protective devices would have avoided this serious and expensive repair to the motor. The additional cost of an oil starter or small industrial oil switch for controlling these motors under 7½ h.p., is very small when compared with the protection they provide. Having the contacts under oil, the danger of poor contact caused by blistering on a knife switch is removed, and the starting device provided gives added confidence to the operator handling the machine, and protects these small motors on a similar basis to the protection provided by the auto-starters furnished with the sizes from 7½ h.p. up.

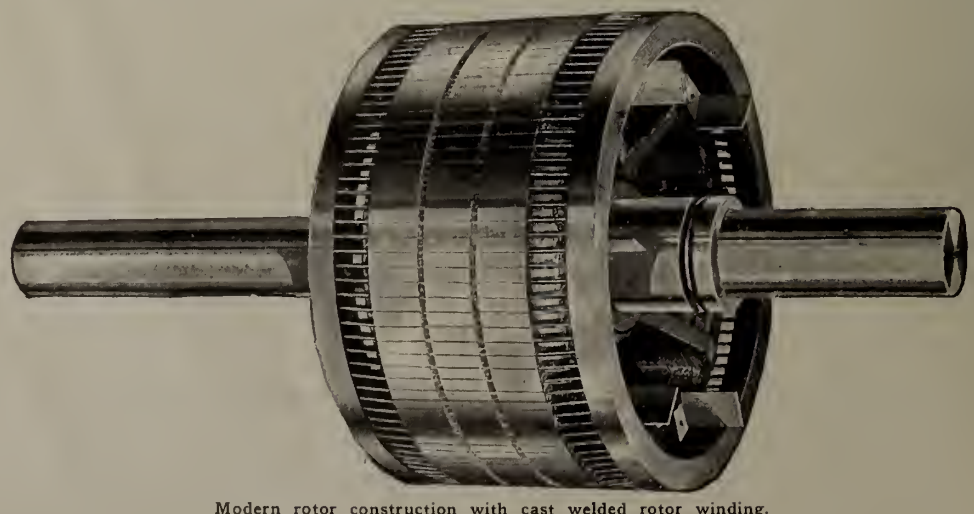
When you feel that you want to tell the foreman that he is no gentleman, resolve that when you reach home you smile at your wife.

Home Furnishings Bureau Organized

The Home Furnishings Bureau, which was recently incorporated as separate and distinct from the Furniture Manufacturers' Association, has been organized on a working basis. The following officials have been elected: W. J. Anderson, chairman; J. H. Baetz, secretary; G. W. Gibbard, J. H. Kennedy, D. E. Macintyre, A. H. Smyth and H. M. Snyder, directors. T. Lyle Blogg will direct the work as heretofore.

An effort is being made to secure the support and co-operation of all furniture manufacturers, and it is hoped that an extended publicity and sales compelling campaign will be inaugurated in the near future. Already more than half of those who supported the publicity work last fall have promised their support, and it is hoped that before long sufficient funds will be available to enable active work to be undertaken.

Many of the furniture manufacturers feel that had it not been for the publicity campaign which was carried on for a few months last fall, conditions in the furniture industry would be much worse than they are today. The general public have only so much money to spend and it is felt that the furniture industry must take the aggressive in order to secure their share. The manufacturers of automobiles, washing machines and vacuum cleaners are all on the alert, and unless the furniture industry awakens to the seriousness of the situation, they will find that these other industries are encroaching on their business and getting money which should go toward furnishing the home. In manufacturing and selling furniture, the furniture men are dealing with a commodity which goes into and makes the home and which must be lived with, and it should not be hard to convince the public that if they have any money to spend, good furniture and an attractively-furnished home means more in the way of comfort, pleasure, pride and general satisfaction than automobiles, washing machines and similar articles. Again, in view of the fact that the campaign which is to be waged by the American furniture manufacturers will, owing to the way American magazines circulate in Canada, reach the Canadian public and may create a demand for American stock, the Canadian furninture makers should make a determined effort to keep Canadian-made furniture to the fore.



Modern rotor construction with cast welded rotor winding.

What Form of Drive Shall I Adopt?

Points to Consider in Analysing Power Requirement of Plant—Comparison of Individual and Group Drives—Load Motor to Capacity for Best Results

By R. J. Owens*

The application of motor drive to all classes of machinery used in the various industries has undergone a marked development during the last few years, due principally to the scarcity and high cost of labor, and to the demand for increased production. No problem confronting the industrial engineer, the shop manager or the foreman deserves more consideration than that of motor drive. It is the key note of economic transmission of power and production. Extensive tests made in a large number of installations have shown conclusively that without motor drive the transmission losses are abnormal, in the majority of cases approximately 50% of the total power consumed, requiring the use of a larger boiler and engine.

Motor replacing countershaft or shaper, drive being from pulleys on both sides of motor.

Motor drives for any class of machinery may be divided into two classes, namely group drive and individual drive. Each of these methods has its own particular advantages, depending upon the conditions under which the driven machine operates. In a given installation there are many fluctuating factors present which make it impractical to set a fixed rule which will govern the selection of the type of drive most desirable.

Group drive is applicable where the driven machines are small and all run at approximately the same fixed speeds. If only a short line shafting and few belts are required for the group of machines, individual drive would involve a higher first cost which would not be offset by the saving in increased output and economy of operation.

Advantages of Individual Drive

Individual drive is preferable for pumps, blowers, elevators, machine tools and woodworking machinery as it eliminates losses entailed in the use of shafting and pulleys for power transmission and at the same time requires less space and reduces the cost of repairs. Some of the main advantages of individual drive are:

1.—An increased output per machine.

2.—Smaller power house capacity required.

3.—Operating cost minimized.

4.—Increased safety for operators due to absence of belts, pulleys and shafting.

5.—Increased light due to no overhead line shafting in belts, allowing evenly spaced lighting units.

6.—Cleanliness and neatness more easily maintained.

7.—More floor space available.

8.—Permits machines to be placed to best advantage both as regards flow of materials and lighting facilities.

Before a selection of equipment is made for the installation of motor drive in an industrial plant, a complete analysis of the surrounding conditions is necessary for the determination of the motor capacity and the type of control apparatus best adapted to any particular case. In order to insure reliability and continuous service of the installation, careful consideration should be given the combination of the motor, control apparatus and driven machine. The characteristics of each of these three elements should be studied with the end in view of obtaining the most satisfactory drive under all possible operating conditions.

Some Points to Consider

It is necessary to have sufficient data from which to determine such operating conditions as will influence the choice of the driving and controlling apparatus. In addition to the size and type of motor, the relative values of each of the methods of drive are to be considered. The size of the motor will depend upon the maximum load on driven machines, its duration, and the temperature rise allowable in the motor under actual full load operation conditions. The following items should be known in as much detail as possible, all of which will have a more or less direct bearing on the choice of the motor and control equipment as well as the method of drive which will be the most economical:

Band resaw direct driven, using flexible coupling.

1.—Kind of current available; whether alternating or direct current.

2.—Source of power; whether supplied from an

*Mechanical Appliance Co., Milwaukee, Wis.

isolated plant or from a central station system.

3.—Voltage; and if alternating current, phase and frequency.

4.—The nature of other loads on the same power line to determine the effect of starting motors.

5.—Description of driven machine. Under this item may be included the conditions under which the driven machine operates; whether the load is continuous or intermittent and if constant or variable speed is required.

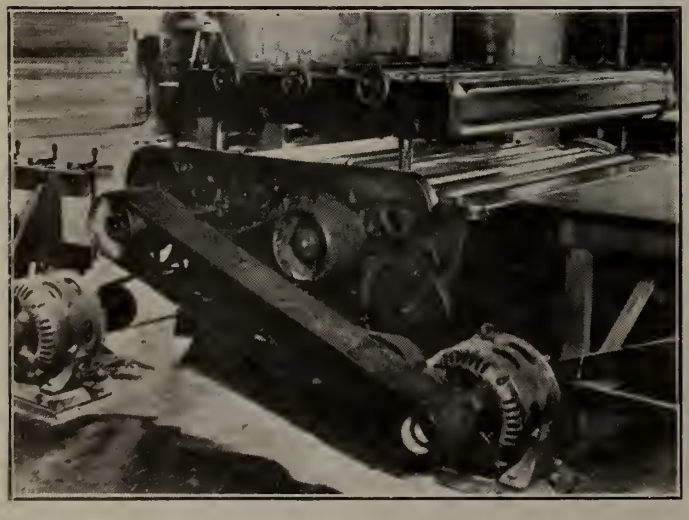
6.—Method of driving; group or individual drive, type and size of coupling if direct connected, pulley data is belted, size of pinion if gear or chain drive, also data if friction pulley or clutch drive.

7.—The load conditions are of the utmost importance in determining the motor capacity and the particular type of motor adaptable. The driven machine in all cases has a cycle of operation, either where a definite cycle repeats itself periodically, the motor coming to rest or running idle between cycles, or a variable load with a repetition of cycles. If possible a load diagram should be obtained of a complete cycle of duty showing the maximum horse power, time on, time off, and friction load. The future load conditions should be considered, as well as the possibility of varying the cycle of operation to any advantage and the fly wheel effect of the moving parts of the machine.

8.—Conditions of starting; intervals at which machine is started and stopped, reversals, time necessary for acceleration and the application of the load during starting.

9.—Speed; what kind of speed regulation is necessary; is standard adjustable speed required. What speed range is required. Also the relation of the load to the speed, that is, does the load increase with the speed, or is the load constant regardless of speed, or any other possible relation.

10.—Control equipment; desirability of either hand or automatic control, and if automatic is remote control desirable, and the location of the various elements



Sander driven by two motors, belt connected. Eliminates countershaft.

of the control equipment. What kind of protection is wanted, that is with reference to voltage failure, phase reversals or phase failure and overload protection. Additional data should also be included with reference to brakes, limit switches, etc., which may be required.

11.—Location of motor; what are conditions of the location of the motor with reference to dust, acid fumes, moisture, inflammable material, high temperature, ventilation, safety requirements and insurance rules. Also in connection with the location of the motor relative to the driven machine the method of mounting should be considered and also the provision for accessibility which will have a direct bearing on the ease of making repairs to either the motor or the driven machine.

Special Types of Motors

Each type of alternating and direct current motor has a particular field of application depending upon the mechanical design and operating characteristics. The

Direct motor drive to planer head, through flexible coupling.

increasing expansion of transmission lines throughout the country and the development of municipal power plants is making use of alternating current almost universal.

Taking into consideration the types of machines which require motors having adjustable speeds, the alternating current motor has certain limitations as compared with the direct current motor, where self-contained motor drive is desired. In a majority of cases the alternating current motor will give the same results, using the slip ring variable speed type or the multi-speed squirrel cage motor. In the former a speed range from normal to 50% of normal is obtainable, but this type of machine is not suitable for all drives as the speed varies with the load and the controller cannot be set to obtain certain definite speeds unless the load at each speed is known. The latter tpye, the multi-speed motor, has been designed for from two to four speeds, and has essentially the same operating conditions as an adjustable speed D.C. motor, the speed at each point varying only slightly with varying loads. The stator of this motor has a separate winding for each speed, any one of which may be connected to the line, speed changing being accomplished by connecting the proper winding to the line. In a four speed motor this amounts to practically four squirrel cage motors in one. This is a new type of motor and is not very well known, but for various applications it has attractive possibilities.

The squirrel cage type of motor will meet the majority of requirements in the field of alternating current applications. On account of its rugged construction and being little effected by dust, it may be used in many locations where enclosed or semi-enclosed direct current motors would be required. This type of motor may be supplied with enclosing covers for locations where exposed to excessive moisture or abrasive dust, in which case the capacity is decreased, except where very intermittent service is required, and the selection of the motor should be made with this in mind. A considerable saving in first cost, as well as in

the operating cost can be effected by ordering equipment for intermittent duty. This requires a careful study of the load conditions. Efficiency and power factor are of importance where the motor is to operate for long periods, and power is excessive..

Load Motor to Capacity

Most standard motors are so designed that the maximum efficiency occurs at full load. In the selection of a motor for a given load, care should be exercised in using a motor which is not too large, as a standard motor operating at a fractional part of full load has a low power factor and efficiency. In a group of motors the matter of power factor reaches considerable importance, especially where the supply line is of considerable length. A low power factor causes a heavier current to flow, which in turn produces greater line losses and a lower generator capacity. A common fault in a great many applications is the "play safe" tendency in selecting a motor of sufficient size to do the work. In cases where it is impossible to obtain sufficient data relative to the power required to drive a machine, its requirements may be measured by the use of a trial motor before the permanent selection is made.

In many instances in the installation of group drive where one motor is used of the same size as would ordinarily be required to drive each of the machines separately, or large motors had been replaced by smaller ones in individual drive the result has been to produce a higher power factor, better voltage regulation and efficiency. As will be noticed from efficiency and power factor tables of standard motors the higher speed motor has the highest efficiency and power factor. Considering this point and also that the higher speed motor is smaller, lighter, and less expensive for the same horse power, it is obvious that considerable improvement in both economy and quality of service may be made by choosing the higher speed motor, particularly where the driven machines operate at high speed which would necessarily require belting or gearing if low speed motors were used.

Power Rates in Force in Various Sections

Figures Showing Charges Which Prevail in Well Known Centres—Power Costs Very Reasonable—How Does Your Rate Compare?

There is hardly a town of any importance in Canada in which current, either steam or hydraulically generated, is not available for power purposes. The rates in the various sections vary somewhat but in no case can they be called prohibitive. Where the power is generated in coal-burning plants, the price of coal and the high freight rates are factors to be considered in fixing the rates charged. In such provinces as British Columbia, Ontario and certain parts of Quebec where waterpower is available in large quantities, the power rate is comparatively cheap, while in other sections, which are not so favored and

Battery of fast feed matchers with individual drive. Notice absence of heavy drive belts.

which are at a considerable distance from coal fields, it is only natural to expect higher charges.

Nova Scotia

It may be of interest to compare some of the rates which prevail in different parts of Canada. Starting with the Maritime Provinces, we find that in Halifax the charges work out at an average rate of about 3-6/10c net per kw. hours.

In Amherst, N.S., the rate is graduated as follows:

4c per h.p. per month for the first 180 hrs. of connected load
3½c per h.p. per month for the second 180 hrs. of con. load
2¼c per h.p. per month for all over 360 hrs. of connected load

A guaranteed minimum monthly charge of $3.75 is made per h.p. demand. The above figures apply on installations of 60 h.p. and over.

New Brunswick

In St. John, N.B., and vicinity, the charges are fairly high. This is accounted for as outlined above by the fact that the current is steam-generated. The prices charged by the New Brunswick Power Co. at St. John are as follows:

For the first	200	Kw.H. per month	12c	per Kw.H.
" " next	300	" " "	8c	" "
" " "	500	" " "	5½c	" "
" " "	1000	" " "	4½c	" "
" " "	3000	" " "	3½c	" "

For any excess over 5000 Kw.H. per month 2¾c per Kw.H.

These charges are net and are not subject to discount. The lighting rates are on a sliding scale, starting at 15c per Kw.H. and dropping to 7½c per Kw H.

Quebec

In Montreal and Quebec a sliding scale per h.p. applies when on a 5-year contract. The charges vary from $50.00 per h.p. per year for 1 h.p. to $30.00 per h.p. per year for installations of 100 h.p. and over. On a meter basis the rate slides from 3c per Kw.H. for amounts under 200 Kw.H. per month to 1c per Kw.H. for 5,000 Kw.H., and .08c per Kw.H. in excess of 5,000 Kw.H.

Ontario

In Ontario the majority of the municipalities are supplied with power by the Hydro-electric Power Commission of Ontario. The charges in each municipality vary according to the distance from the source of supply and according to the amount of

current used. Two charges are made, one a fixed service charge, which covers the carrying charges on the investment required to supply each municipality with current, covering such items as transmission line, sub power stations and service costs. This is a fixed charge whether current is consumed each month or not. The other charge is based on the amount of current used. The charges which prevail in a few of the principal woodworking centres in Ontario are as follows:

	Service Charge per H.P. per month.	1st 50 hrs. per month, per Kw.H.	2nd 50 hrs. per month, per Kw.H.	All additional current per Kw.H.	Discount
Guelph	$1.00	c1.467	c1	c0.15	10%
Ingersoll	1.00	1.67	1.11	0.133	10% & 10%
Kitchener	1.00	1.86	1.26	0.16	25% & 10%
London	1.00	1.86	1.26	0.16	25% & 10%
Midland	1.00	2.0	1.4	0.15	10%
Ottawa	1.00	1.8	1.2	0.15	15% & 10%
Owen Sound	1.00	2	1.4	0.15	10%
Preston	1.00	1.67	1.11	0.13	10% & 10%
St. Catharines	1.00	1.6	1.06	0.16	25% & 10%
Stratford	1.00	2.5	1.7	0.15	10%
Toronto,	1.25 first				
10 h.p.	1.00 all	1.5		0.5	0.15	10%
additional					
Waterloo	1.00	1.67	1.11	0.13	10% & 10%
Woodstock	1.00	1.86	1.26	0.16	25% & 10%

Manitoba

Working toward the west we find that in Winnipeg, electric power is sold at the rate of 3c per Kw.H. with a monthly minimum payment of 75c per h.p. of total load connected, with a net minimum charge of $1.00 per month per meter. A sliding scale of discounts is in effect in proportion to the amount of the bill. On bills up to $25.00 the discount is 10%; $25.00 to $50.00, 20%; $50.00 to $100.00, 25%; $100.00 to $200.00, 30%; $200.00 to $300.00, 40%; $300.00 to $500,00, 50%.

Saskatchewan

At Regina, Sask., a service charge of 50c per month per h.p., connected load, is made and the power consumption rate is 5c per Kw.H. for the first 20 hours per month, and is gradually reduced 2.5c per Kw.H. when the amount consumed reaches 900 Kw.H. or over. In addition to this, special concessions are made to large power users depending on the amount of power consumed.

Alberta

In Calgary the power rates are lower. The following schedule prevails:

1,000 to 2,000	kw.h.	consumption	per	month	2c	per	kw.h.
2,000 to 5,000	"	"	"	"	1.8c	"	"
5,000 to 12,500	"	"	"	"	1.6c	"	"
12,500 to 25,000	"	"	"	"	1.4c	"	"
Over 25,000	"	"	"	"	1.3c	"	"

The minimum charge up to 20 h.p. is $1.00 per h.p. of demand per month. The connected load is considered as not less than 3 h.p. and 100% of connected load. Up to 50 h.p., $1.00 per h.p. per month, and not less than 80% of connected load; over 50 h.p. $1.00 per h.p. per month, and not less than 40% of connected load.

British Columbia

The British Columbia Electric Railway Co., Limited, of Vancouver, who supply energy to that city and surrounding municipalities, including Victoria, B.C., utilize the waters of several nearby power sites in generating their current. The charges are divided into four classes. First—Small motors up to 5 h.p., for which the rate is 5c per Kw.H. on the first 300 Kw.H. of monthly consumption and 2c per Kw.H. for all power consumed in excess of 300 Kw.H. In this class the minimum charge is $1.00 per month up to and including a 2 h.p. installation, and 50c per h.p. for all over 2 h.p. Second—For installations of from 5 to 25 h.p. the rates in this class are the same as those given above with the exception that the minimum charge is $2.50 per month up to and including 5 h.p. connected load, and 50c for every additional horse power up to 25 h.p. The third class includes installations of 25 h.p. and over. The rate in this class is 2c per Kw.H. with a minimum charge of $12.50 per month up to 25 h.p. and 50c for connected horse power for all additional loads. The fourth class is for large power consumers with an installation of 200 h.p. and above. The rate in this class at a monthly consumption basis is 2c per Kw.H. for the first 65 Kw.H. per active horse power; ¾c for the next 65 Kw.H., and ½c for all in excess of 130 Kw.H. per active h.p. These charges are subject to the following discount:

100 to 200	active	H.P.	net
200 to 300	"	"	5%
300 to 500	"	"	10%
Over 500	"	"	15%

The one exception in the above class is where a 3 year contract is accepted at a flat rate of $1.00 per h.p. of maximum demand, plus ½c per Kw.H. Under this heading the minimum charge is based on the maximum demand or otherwise 50c per connected horse power.

It will be seen that none of these rates are excessive; in fact they are so low as to make an electrical installation an attractive proposition in any locality where power is available. One advantage of the electric drive and a feature that is appreciated by many users of electric energy is that there is never any doubt as to what the power required to drive a plant costs per month or year.

National Association of Accountants to Meet

The preliminary program of the annual convention of the National Association of Cost Accountants which is to be held in Cleveland on September 14, 15 and 16 next, has just been issued. It provides for three days of conferences on practical cost questions, including "Interest as an Element of Cost," "Cost Systems as a Means of Preventing Waste," "Uniform Methods and Standardized Costs," "Executive Use of a Cost System," "Costing in Canada," and a number of similar topics. It is expected that upwards of one thousand cost men will take part in these conferences.

May Undertake Research Work

The University of Toronto is considering the advisability of making a study of kiln-drying methods as applied to Canadian woods, with a view to improving the process of artificial seasoning. A number of furniture manufacturers have been approached on this subject and in their opinion it would be a good move, one that would fill a long-felt want. It is probable that Prof. Gillespie, of the University of Toronto, will lay the matter before the furniture men at their semi-annual meeting which is to be held on May 18th.

What a Cost System Should Do For You

Tends to Ensure Adequate Profits—Shows Leaks and Weak Spots—Points Out Unprofitable Lines—Desirable Check on Manufacturing Activities

By E. W. McCullough*

(This is the first of a series of articles which are being prepared by Fabricated Production Department of the U.S. Chamber of Commerce. The second installment, "Overhead Expenses and How to Distribute Them in Good and Bad Times" will be included in the June issue of the "Canadian Woodworker and Furniture Manufacturer."—The Editor).

Individuals' memories are limited in the number of accurate records which they can retain. Business consists of transpiring events, all of which must be properly attended to. The solution of the problem of securing reliable records of many transactions without depending upon the fallibility of memory has been found through systematic methods for conducting the operations of business. One of the very important matters relating to business operations, and one in which a number of records are involved is cost accounting.

Primarily, a business to exist must make money. This means that something must be disposed of for more than it has cost. Every manufacturer, therefore, is vitally concerned with the two items—cost and profit. The problems presented in labor, materials, production costs, and keen competition have made it necessary for a manufacturer to determine and constantly to know the cost of his product in order that his business may continue to be a profitable one, and earn the margin of profit desired. There is a definite dividing line between profit and loss, and the location of this dividing line can be and should be accurately determined.

Gives Control of Business

Cost accounting is an accurate method for arriving at the cost of producing a complete and saleable commodity and delivering it to the carrier for transportation, reporting in usable records all of the various elements which go to make up these costs. Records of costs are valuable in themselves, yet it is the detailed information which they contain, available for ready reference, which is of utmost value. Accurate information regarding the various elements which go to make up costs, as contained in cost records, automatically eliminates arbitrary, empirical, or guess costs which prevail to a surprising degree among many manufacturers. The cost system, like an X-ray picture, brings to light imperfect internal conditions and suggests correction.

*Manager, Fabricated Production Department, Chamber of Commerce of the United States.

Checks Variations from Standard Practice

Among the many ways in which cost keeping is an aid to production are the following. It brings to light inefficiencies in system by calling to attention the cost of its operation and points out equipment that has become inadequate by showing an excessive cost of product coming therefrom; it points out employees who are below the standard required, and permits of performances being kept within certain limits by watching the accumulation of costs. Increased production depends largely on the intimate knowledge the management has of all elements in their manufacturing operations which can only be supplied through an adequate cost system. It enables them to establish proper control and increase output as warranted by the cost record.

In many plants considerable sums of money are spent to establish a standard practice of operation. From time to time certain variations from the established standard practice occur, affecting costs in an

Another adaptation of electric drive to shaper.

adverse way. Timely cost reports showing what is happening, rather than what has happened, suggest immediate correction of such inefficiencies. It is not sufficient that executives simply know that expenditures are excessive; they should be supplied with information to determine exactly where these excessive expenditures occur and take action. Definite responsibility for expenditures as well as the authority to make the expenditures should be fixed by an adequate system of cost accounting.

Overhead, or burden, consists of expense items which cannot be directly attributed to some particular product. It is composed of indirect labor and material, rent, etc. Overhead being variable, as related to output, and forming a material portion of a plant's expense, it is necessary that control over these accounts be rigidly kept. Control is possible only when accurate knowledge of the amounts entering into each item composing overhead are known. Guessing or estimating amounts of overhead, as well as arbitrary distribution without a sound basis for the allocation is uncertain and leads to unexpected results. Sales price does not affect overhead, but the amount of overhead definitely and absolutely affects sales price.

Promotes Intelligent Competition

A factory manager should have before him detailed cost reports showing the expenditures necessary to produce articles. With this information at hand, he is in a position to note the variables and put into operation the movements necessary for their satisfactory control. In this respect, the cost system is similar to the nerve system of the body, its function being to transmit information regarding conditions in the entire plant to some central individual or body.

No one enters business to fail but the majority who do lose out do so from various causes, but principally because they disregard the question of costs. Your worst competition is largely from those who do not know what it costs them to produce and do business. When normal production returns, competition will force closer margins and costs must then be known. Why not now?

The manufacturer who bases the sales price of his product on competition without regard to real cost, stands to sell his product at a closer margin than he desires and possibly at a loss. Whether the margin of the profit is ample or not the existing conditions are not known until the date when damage done is beyond repair.

Determines Unprofitable Lines

It is generally conceded that unprofitable lines should be discontinued. Where a variety of articles are manufactured in a single plant a cost system offers the only opportunity for determining positively those lines which are not profitable. Where a single article is manufactured, timely information regarding costs can forestall a calamity.

The raw and semi-finished materials and finished stock are an important part of the assets of a company. Officials who do not properly account for them with respect to price, quality, and quantity, may arrive at a cost lower than is real. This means that profits will be shown as greater than they are. It is obvious that if dividends are paid on the basis of such profits, the capital of the company will be depleted.

A practical, usable cost system should not be complex, but lean toward simplicity. Neither should it require an investment out of proportion to the benefits to be acquired. It should be considered a piece of necessary equipment and treated accordingly; it will return its proportion of dividends on the money paid for it. The adoption of a cost system by a number in any industry, made uniform as to fundamentals, will be found of the greatest benefit in promoting more intelligent trade practices. Technical accuracy in costs, especially in lines involving minute operations, is not altogether desirable or necessary, but costs commercially accurate can always be obtained.

Cost systems, both as to manufacturing and selling, should tie in with the general accounting records so that financial statements drawn will reflect all conditions of the business accurately.

In the making of a budget, the greatest possible accuracy is desirable, and here, too the cost records of the past years afford dependable information.

When a business operates without a cost system, it is in the same position as a boat without a rudder, tossed about by the winds and directed by sources outside of those supposed to be in control, and driven towards an end which is not definite and perhaps not the one desired.

As we catch up in production a new era of competition will ensue, and war time margins will disappear. In their place will come percentages of profit earned by efficiency and determined by accurate cost reckoning.

Produce or Reduce?

In discussing present conditions and suggesting how business might be improved the manager of one woodworking plant puts it squarely up to his men, as follows:

Woodworking products are to-day being sold at prices varying anywhere from 25 to 50% below the prevailing prices of six months ago, and even at this reduction, there is only a small demand as compared with last year. What are we to infer from this condition? First, our finished product consists of labor and material, divided into almost equal proportions. The cost of material has been somewhat reduced—not, however, to the extent to which we have been compelled to cut our prices, whilst labor remains at its former high level.

Trade magazines and other publications have freely discussed the situation and suggested ways and means to reduce cost. Some writers advise greater production. Others, a substantial drop in wages. We cannot procure more for our goods and certainly cannot continue as at present, because, we are going behind every day. It is quite obvious that we must produce more or else submit to a cut in wages.

Do we do the same amount of work to-day as we used to do eight years ago? I say without the slightest hesitation that we do not, and further, we are falling short full 25% of our former standard, which means, that it now takes us five weeks to do what we once did in four weeks. If we can remedy this waste, then the problem will, to a large extent, be rectified. If, however, we cannot or will not do so, the only remaining alternative is by way of the pay envelope. Which shall it be—Produce or Reduce?

There is another way in which we can cut cost, that is by very carefully handling all material, taking great care to get the most out of everything that passes through our hands, and so reduce waste to a minimum. Were this to be done it would have a very marked effect on costs and perhaps on the volume of business secured.

Problems in Standardizing of Dimension Stock

Value of Standardized Dimension Stock Not Recognized—Desirable Economies Could be Effected—600,000,000 ft. Wasted Annually by One Industry

By Wm. A. Babbitt*

The title of this series of studies correctly describes the purpose for which they have been written. Probably no one (certainly not the writer) who knows anything about the complexities and difficulties of the programme of standardization would assume to have the complete answer, or even to be able to state correctly all the problems. It is to be hoped, however, that these studies will serve to stimulate the rapidly growing interest in the standardization programme, and to call forth suggestions and constructive criticisms from all concerned.

In order that lumbermen and wood users, who have not had the opportunity to follow the development of the standardization programme thus far, may get in touch with the situation; a little history might be worth while. The beginnings of the programme are to be found in the efforts of one of the affiliated associations of the Association of Wood Using Industries to establish a sound and dependable basis for standard cost accounting among its member firms. A very exhaustive analysis of the raw material requirements of this association for lumber brought out a number of suggestive facts, and some that were positively startling. The logical and inevitable conclusion from these facts seems to indicate a gradual, but eventually, a complete revolution of procedure, not merely in this particular wood using industry, but in all wood using industries.

Heavy Re-manufacturing Loss

This analysis showed that on a merchantable lumber basis, the association's annual requirements were one billion eight hundred million feet, chiefly hardwoods. This analysis further showed that the logical and only satisfactory basis for the principal raw material factor of cost is not lumber, but dimension stock. An extension of the inquiry shows that this fundamental is also true of nearly all lumber used for fabricating purposes. But when the board measure of this requirement in the form of dimension stock was determined, it was found to be only one billion two hundred thousand feet, board measure. Six hundred million feet are being wasted annually by the reduction of commercial lumber to usable dimension by this one industry alone,—which is one of the smaller at that. Furthermore, it appeared that the bulk of this requirement could have been produced from commercially low grade stock and non-commercial waste, now largely a total loss in lumbering operations. In fact, it has always been known that such a salvage could be made, and that not only the six hundred million feet, but the whole billion eight hundred million feet could be produced from such source.

These considerations naturally raised the final and critical question: "With all these facts established scientifically, and a matter of common knowledge in a general way, both to the producer and consumer of lumber, why should there not be an immediate change to a sound and economical basis?" There is a very large and decisive number of reasons why such a change from a wasteful to an economic basis can be accomplished only by slow stages, against much static and some active opposition. Among these, it may be useful to mention some of the more important.

*Chairman, Committee of Standardization.

Not Easy of Solution

The most difficult feature of the situation is the hugeness of the proposition. It is huge in bulk. Put all the lumber piles on this continent in one huge yard, and it would be a small yard compared to the storage ground required to store the wasted portions of the trees from which the lumber was cut. This matter is not only huge in bulk, it is also huge in its interlocking relations with every phase of manufacture in the country. It is a huge problem presented from the view point of mechanical equipment alone.

The change of basis from the present wasteful methods of wood fabrication to a basis of comparative conservation involves the organization of a manufacturing and sales proposition on the part of lumbermen which eventually will rival their organization for manufacturing and selling merchantable lumber. The problems of dimension sizes and grades are indefinitely more complex and difficult than lumber grades and specifications. The problem of education will be fully as difficult as that, e.g., involved in establishing a market for red gum. The standardization committee is fully aware of these considerations, and cherishes no delusions as to the difficulties ahead, or as to the slow progress that will be made toward their solution.

Under these circumstances, it became evidently both the duty and the opportunity of this association to look for a solution of a condition which produced such enormous wastes, and prevented such huge salvages from the fast waning timber resources of the country. This, briefly, is the story of the beginning of the standardization programme. The organization of the Association of Wood Using Industries and the friendly co-operation of the various associations of lumbermen have now placed this programme on a national basis.

Problems Which Have Been Solved

The first problem has been to get the necessary entente cordiale between the producer and the consumer with regard to the programme of standardization. This has been by no means a simple, easy matter. It required the compilation of much data to establish a presumption in favor of the programme. Dimension stock is no new proposition either to lumbermen or to wood users. Past history has little to testify in its favor. Every lumberman has a choice collection of experience in manufacturing dimension stock, which every wood user can match in his attempts to use said stock. The proof has been fully established that the fault is mutual. The producer did not think that it was worth while to manufacture his dimension properly. He looked down on the job, instead of up to it. The user took the view that because it was dimension stock, and probably manufactured from waste, he ought to be able to buy it at one-half to one-third its real value.

Both parties are now well in accord. Dimension stock is of such high importance that it is entitled to first consideration in care and accuracy of manufacture. Wood users realize that dimension stock, so

manufactured, is the most valuable and economical form in which they can get their raw material: and that to get it, they must pay what it is worth. This means a market price which will make the manufacture of dimension stock a commercially sound proposition for the producer.

The elimination of the "specialty" hazard, in the manufacture of dimension stock, is another problem which has been successfully disposed of. Formerly, both parties to a contract for dimension stock, assumed a risk which does not apply to commercial lumber, viz., the exceptional loss should either party to the contract fail to keep his agreement. If the user failed to take the stock he contracted for, then the producer had left on his hands an unsalable commodity. If the producer failed to deliver, then the user was left with his production crippled or stranded. That this has been no uncommon experience in the past, every party at interest can testify from costly experience.

Standardization Offers Way Out

The answer to this problem is "standardization." By this, we do not mean the standardization of an individual plant, but the standardization of the requirements of the various wood using industries. If a lumberman knows that the production of his dimension mill is standard for an industry or several industries instead of merely being the requirement of an isolated plant, he will have no hesitation in undertaking to manufacture against any orders he may secure, and in a conservative way, to manufacture against the probable requirements of the industry as a whole. On the other hand, the wood fabricator will not hesitate to place his requirements with certain mills, when he knows that he is protected by a lumbering policy which is producing the exact stock he uses, in other mills than his contract source.

Standardization will serve also to eliminate another grave evil, altogether too common in the past. Reference is made to disputes between producers and consumers as to whether the stock furnished is according to specification. Sometimes these disputes have not been a fair question between the parties. They have been unfair attempts by one of the parties to void a responsible contract. With standardization in effect, such disputes can be settled by a neutral third party, or otherwise authoritatively disposed of.

In a single word, the standardization programme rests on the two fundamentals of making it as safe to manufacture or buy dimension stock as to manufacture or buy merchantable lumber. The committee on standardization proposes to press this programme not only because of its great economic benefits to both lumbermen and wood users, but also as a conservation measure, second to no other, in the great patriotic enterprise of saving our forest resources.

Engineering in Furniture Industry

(Continued from page 73)

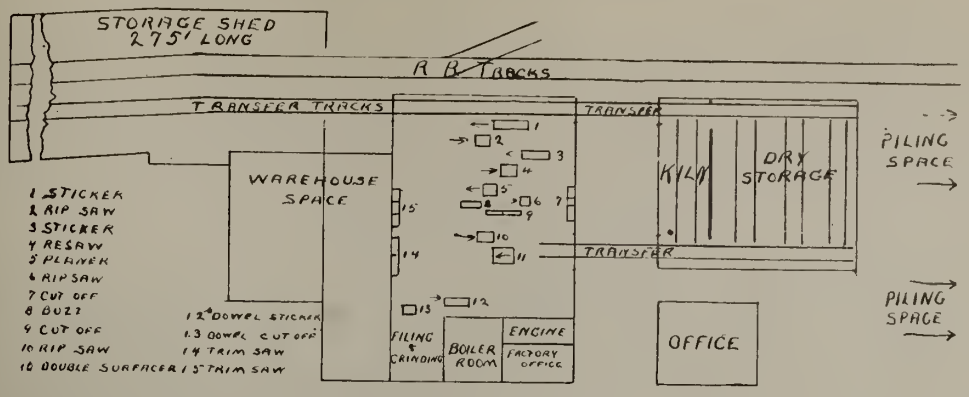
ing may be obtained through a proper selection of reflectors or fixtures at a comparatively small cost in power consumption. For the average machine and bench work in a furniture factory an intensity of illumination of 3-foot candles will be found satisfactory and this intensity may be obtained with the Type C lamps for a power consumption of about 1.25 watts per sq. ft. of lighted floor space. Fixtures or reflectors should be selected to suit the various departments, the selection depending of course upon the kind of work performed. The new enameled steel reflectors, which are made in a variety of styles and designs to suit various conditions will be found very efficient and probably as economical in first cost as any type of fixture that can be purchased. Care should be exercised in locating fixtures over machines or benches so that the direct glare of the lamp will not shine in the workman's eyes. Where such direct rays of light are unavoidable, opal-glass bulbs should be used.

With regard to heating probably the most ideal system is the hot-blast, for such a system provides adequate ventilation as well as heat and in the summer time may be used to cool the air introduced into the factory by circulating cold water through the heating coils. The hot-blast system has the disadvantage of rather high first cost in comparison to direct radiation, and the ducts for distributing the air are likely to be considerably in the way unless provision for them is made in the building construction. A well-designed direct-radiation system of heating will be found very satisfactory and will probably answer the purpose in most cases. Pipe sizes should be liberal so as to use exhaust steam from the engine without too high a back pressure, and the pipe coils or radiators should be so arranged as to obtain a uniform distribution of heat and flexibility of control.

An Eye to Comfort and Convenience

The toilet and locker rooms should be centrally located with regard to the building or floors which each serves, and preferably placed in a service wing, as already mentioned. By so locating these features valuable manufacturing space is not taken up and good light and ventilation may be obtained. Toilets with divided front counterweight seat, extended lip, and of the automatic flushing type should be installed; one for each 20 to 25 men. These toilets may be used for urinals and will be found to give much less odor when so used than but the most expensive urinals. Washing facilities should preferably consist of enameled roll-rim cast-iron sinks with no stoppers in the waste. Hot and cold water supply pipes over the centre of sink with mixing valves, similar to bath cocks, spaced about 18 inches apart for both sides of the sink, will provide a maximum of capacity per square foot of floor space. One wash cock or mixing valve should be provided for about every 10 or 12 men. Such equipment has the advantage that it is easier to keep clean than individual wash basins and forces the men to wash in running water, an important point in preventing the spread of disease. Every man in the plant should be provided with a pressed-steel locker where he may change his clothes, and the addition of a few showers and a comfortable, well-lighted room where the men can eat their lunches will be found to be not only conveniences provided by a generous management, but features which add still more to the contentment and loyalty of the men. Floors in all toilet, locker and wash rooms should be waterproof and non-absorbent so that they may be easily kept clean and sanitary.

As mentioned before, these few notes are not intended as a treatise on the design of a furniture factory, but merely as a brief discussion of some points which the writer feels are worthy of serious consideration. The many factors affecting the design and construction of a plant are so important in their bearing on the final overall efficiency of the plant, that the problem is quite properly one for none but an experienced engineer.



Sketch showing layout of plant, P. W. Gardiner & Son, Galt, Ont.

Specializes in the Standardized Line

Penalizing Special Work Has Tended to Focus Production on Stock Lines— Better Service and Prices Through Elimination of Odd Jobs— Efficient Storage and Handling Facilities

One of the most interesting industries in Galt, Ont., especially from the viewpoint of a woodworker, is the large door factory operated by P. W. Gardiner & Son. The term "door factory" is used advisedly, for while other lines are produced, they are carried on as side lines to the main operation, which is the quantity production of interior and exterior doors. The other articles manufactured include sash, turned columns, mouldings and interior trim.

This business was founded in 1900 by P. W. Gardiner and his son, J. E. Gardiner, and has grown and expanded in a very gratifying manner. The manufacturing operations are under the supervision of R. R. Gardiner, a brother of the senior member of the firm. The factory and warehouse facilities have been enlarged and added to on several occasions, until to-day they occupy buildings having a total floor space of 35,000 feet. In addition there are lumber storage sheds, dry kilns, garage, etc.

Excellent Storage Facilities

The long storage shed for rough and finished material is worthy of special mention. This building is 275 feet long and has both factory and railway trackage running its entire length. One side of this building is devoted to storing door stock and other material that is usually purchased in a dry condition. The other side, part of which is double-decked, contains manufactured mouldings and other stock in addition to rough lumber. This huge shed makes them independent of weather conditions, loading and unloading being carried on without hindrance and without exposing the stock to rain or snow. The factory trackage feeds the stickers in the main plant and is carried through the kilns and dry storage. This facilitates the handling of the raw material.

The stock for the doors is brought in on kiln trucks to the Yates double surfacer, where it is dressed on two sides. It is then ripped to width, the material being cut so that it works to the best advantage possible. From the rip saws it goes to the trim saw and is cut to the different lengths and is then passed to the warehouse where it is segregated and stored in orderly piles.

The breaking out and the subsequent manufacturing are conducted as two distinct operations or departments. After the material has been dressed, ripped and cut to length, it is passed to the warehouse from which it is drawn as required by the door manufacturing department. There is always enough stock ahead to make each department independent of the other. The trim sawyers are furnished with complete cutting lists for the full line of doors and work all stock to the best advantage. The foreman of the breaking out room keeps his eye on the parts stored in the warehouse and if he sees any items which appear to be running low, he instructs his men to concentrate on that part for a little while.

This system is not so complicated as it may seem for the number of designs have been reduced to a minimum and the parts standardized. Thus a 6 ft. 6 in. stile or a 3 ft. 0 in. rail will do for many different styles of doors. It has the advantage of enabling each department to work independently of the other, avoiding vexatious hold-ups and delays and enables production to be maintained at capacity.

In the door-making department, which is on the second floor, when the material is brought in from the warehouse, the rails and muntins are run through a double end tenoner and then through the door sticker. The stiles are bored on a special automatic boring machine, capable of handling two pieces at a time, and go from there to the sticker. Special rail boring and dowel driving equipment has been installed to handle that end of the operation. The panels are worked out on the resaw, planer and trim saws on the lower floor, then sanded and if required raised or moulded in the door-making department. The pine doors are sanded on a drum sander while the hardwood ones are finished on a belt sander. The normal output of this department is around 300 doors per day.

Turned Columns a Specialty

All rippings from the door stock which are suitable, are worked up with the sash and turned column material. The manufacture of these columns is a very interesting operation. The strips or staves are first dressed to the required thickness and then run through a special column stave jointer. This machine makes a tongue and groove joint at a suitable bevel, but the

unusual feature is the way the side heads are mounted and controlled. These may be set so that they will taper the staves from end to end or so that the staves will be wider in the centre than at either end, making a column with a swell centre of entasis. It can also be set for straight jointing and is thus used for all core stock for veneered hardwood doors.

After jointing, the staves are glued in special forms, casein glue being employed, using special chain clamps. The columns are now turned off and then fluted on the shaper. This fluting is done in a special carriage which carries the columns past the shaper head. The shaper spindle has been extended, raising the head well above the table, and an arm with top bearing attached. The cutter is mounted between two collars which are shaped to conform to the curve of the column. This does away with the necessity of using a guide, the columns being grooved against the collars.

Effort to Standardize Product

The sash equipment consists of the usual sash sticker, tenoner, mortisers, arm sander, clamps, etc. While stock sash are produced, most of the sash are made to order. This differs from the door department, where as far as possible everything is stock. By raising the price on special doors, in small quantities, particularly, and explaining that the line manufactured covers all ordinary requirements, special order work has been discouraged. It has been found that to interrupt production, to put through a small order for odd or special doors so increases the cost that even raising the price a few dollars does not reimburse for the loss of time and the additional work involved. The point is a good one. If a concerted attempt were to be made to penalize and discourage special designs in doors, sash and mouldings, it should increase the demand for stock material and thus ensure a market for stock items as well as result in reduced costs.

Storage shed 275 ft. long provides excellent facilities for loading and unloading stock.

The mouldings produced consist of the usual line of items for the interior and exterior decoration of the home. A suitable range of patterns are manufactured and every effort is made to work to standard so that the last batch of mouldings will match, in every detail, some turned out last year or earlier. This means that the dealer does not accumulate odd stock as the new lots always match the old.

When one considers that quality of the product is the first and main consideration and that sufficient stock is usually on hand to give prompt service it is not to be wondered at that P. W. Gardiner & Son have succeeded in building up a satisfactory business, among a large number of dealers, in doors, sash and building trim.

American Furniture Men to Advertise Product

The Furniture Publicity Bureau, which is to carry on an extensive advertising campaign for the furniture industry in the United States, has been organized on a permanent basis. The publicity work of this organization is being supported by both the retail and manufacturing branches of the industry, and will be conducted on a large scale. An effort is being made to collect an initial campaign fund of $1,000,000 and it has been decided that active publicity work will not be undertaken until this amount is assured.

The constitution of the newly-organized bureau is as follows:

ARTICLE I.

The title of this Bureau shall be **The Furniture Publicity Bureau.**

ARTICLE II.

The object of this Bureau shall be to educate the manufacturers and distributors of furniture and also the general public, so that:

(a) Through the spread of public knowledge and understanding about furniture, its true service value as ministering to the stability and happiness of American home life may be better realized.

(b) To emphasize the Essentialness of Furniture shall be the main function of this Bureau.

ARTICLE III.

The membership of this Bureau shall consist of manufacturers and distributors of furniture whose application has been approved by the Executive Committee.

This Bureau shall have an Advisory Board made up of men from producing and distributing branches of the Furniture Industry.

The direction and control of the Bureau shall be vested in an Advisory Board.

ARTICLE IV.

The annual meeting shall be held on the second Thursday of January of each year, at which the election of the Advisory Board shall take place. Those having the highest number of votes shall be declared elected.

Following adoption of the Constitution and By-laws the following officers were duly elected:

President—P. E. Kroehler, Kroehler Mfg., Co., 14 E. Jackson Blvd., Chicago, Ill.

Vice-president—J. L. Young, Young Furniture Co., Cleveland, Ohio.

Secretary—Wm. B. Baker, 531 Monadnock Bldg., Chicago, Illinois.

Treasurer—C. S. Dexter, Grand Rapids Chair Co., Grand Rapids, Mich.

Executive Committee for three year term—M. W. Hubbard, Buschmann-Hubbard Co., Cleveland, Ohio; Z. G. Simmons, Simmons Co., Kenosha, Wis. Two year term—John A. Thompson, Aexander H. Revel & Co., Chicago, Illinois; W. J. Wallace, Berkey & Gay Furniture Co., Grand Rapids, Mich. One year term—M. Lammert, Lammert Furniture Co., Inc., St. Louis, Mo.; Ralph W. Taylor, Jamestown Table Co., Jamestown, N.Y.

Building Up an Efficient Organization

Shortage of Capable Woodworking Executives—Provide Sufficient Raw Material in Shape of Ambitious Employees—Secure Co-operation by Just Recognition of Merit

By W. Warren

There is, without doubt, a serious shortage of men willing and capable of qualifying for executive positions in our woodworking organizations. This dearth of suitable men has been brought about from various causes, one of the principal of which is an unwillingness on the part of those higher up to perpetuate their profession by handing on knowledge they might possess to an apprentice or understudy. Quite frequently one comes in contact with an individual who fondly imagines that to pass on any information will enable those following to become contestants for his position. A man of this kind is living entirely in the present, all unmindful of the future, and is a misfit of little or no commercial value.

One of the inherent qualities of mankind is to perpetuate the race. A man who really loves his profession should desire to perpetuate that calling, secure in the knowledge that in trying to improve his understudy, he is strengthening his own position and maintaining a lead that can only be assured in that way. He is doing his part toward elevating the standard of his profession.

Test of Any Organization

It matters not what our position may be—manager, assistant, foreman, or any executive position whatsoever, we should at all times arrange our work so that in cases of enforced absence it will still go on without friction or loss. Our work may run along with clocklike precision when we are present, but unless it goes along with the same lack of confusion should we be absent, then we are a failure and most certainly lack organizing ability. The battery must be so charged that it will function properly if left alone for a period.

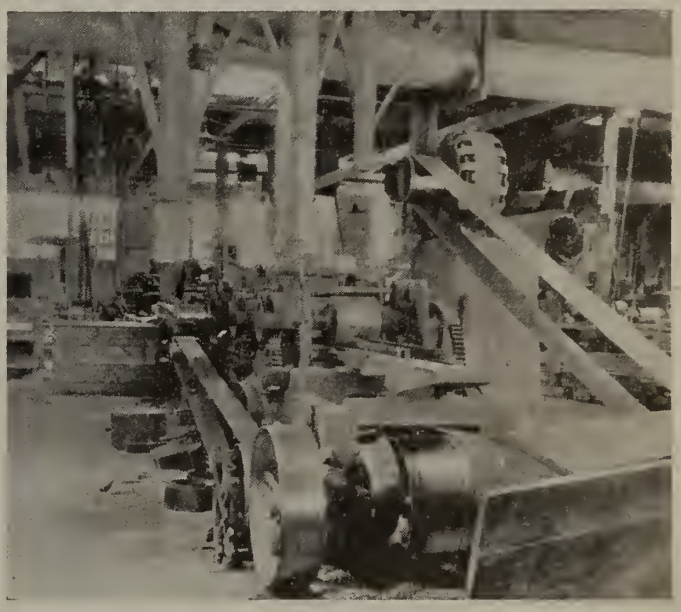
We do not pay sufficient attention to the training of new men, nor do the young beginners give adequate thought to the trade or profession of their choice. Our managers, superintendents and foremen, are nearly always drafted from the yard, mill or factory employees, and for this reason it is of utmost importance that a supply of good, intelligent, enthusiastic men be continually in the making.

Labor Uncertain Factor

The human element is a tremendous factor in the woodworking business. We would not think of attempting to carry on without making provision for future stock. In this we are continually looking ahead, while to a large extent, we make little or no provision for our future needs as regards labor, though our finished product consists in the main of labor and material. In estimating, we have to consider both factors. We can easily estimate the material, because it possesses a definite value at point of destination, but here the labor with all its uncertainties steps in.

The cost of unloading and piling; the cost of kiln drying; the cost of manufacturing; undue waste during process of manufacture; the proper care of machines to ensure a minimum in loss of time and power, repairs, shipping, etc.

The cost, on the above-mentioned items, may, and quite frequently does, fluctuate 50%, according to the efficient or inefficient way in which they may be handled. It will be seen from this how uncertain any labor estimate really is. The remedy is entirely in our own hands and seems to me to be just this: Create a feeling of loyal, cheerful enthusiasm among the executives, and let it be generally felt that work well and efficiently performed will not pass unnoticed or unawarded. Like a ripple on the ocean, it will reach the remotest operators and reduce handling and manufacturing cost to a minimum. It will not only remove uncertainty, but it will tend to keep the workman's interest centered on his work, to the exclusion of extreme views, antagonistic to his employer and incidentally to himself.



Individual drive, motor belt connected to sticker.

This may sound utopian and chimerical, but if put into practical use, will create a recruiting ground capable of supplying a man for every position in the woodworking business and efficiency will be emblazoned in all actions.

The Seemingly Unimportant Things

Eternal vigilance is the price of good work. It is the little things that slip past us that cause most of our troubles. In this age of hustle and bustle the tendency seems to be to look after the larger items and allow the little things to take care of themselves. If we were to revise the process and pay particular attention to the little things, the seemingly unimportant items, the larger details would not require attention. Let us make a resolution that from now on we will carefully scrutinize all details of the work that passes through our hands and our department and see if we cannot eliminate many of the minor troubles with which we are confronted as well as raise the quality of our product. Remember it is the little things that count.

Competition in the Millwork Business

Industry Must Be Placed on Stable Basis—Wide Variation in Quotations Results in Air of Uncertainty Among Consumers and Causes Hard Feelings Between Operators

By C. B. Harman*

Fair, wide open, intelligent and discreet competition should prevail always, as it produces a wholesome feeling among sellers and buyers; stimulates business; affords the opportunity to manufacturers to improve their selling methods and opens up the way for improved construction and better working conditions for the employees. Orders secured fairly and intelligently makes life worth living. It makes a fellow feel happy, friendly to his rival, it brings a free conscience and affords one the means of giving a customer a square deal for his money and willingly.

Regardless of the law on the subject, it would be unjust, unwise, unprofitable and morally criminal to stifle or restrict competition of the fair, wide open, intelligent and discreet kind. When a seller makes an order in which he knows he has a fair profit, he has nothing to fear, to be ashamed of, to keep secret or regret. He feels happy and obligated to the customer and himself to furnish gold bond material, full measure, strictly up to specifications or better. He knows that the buyer has been fair to him, that he secured the order on its merits and that he carries the good will and respect of his competitors who lost out. He feels the importance of having added something to the good morals of his business.

Webster defines competition as: "a competing; a contest; rivalry. Surely when making up this definition Mr. Webster did not have in mind the present day competition, contesting, strife for superiority, emulation or rivalry as carried on among mill work manufacturers and others who sell our products. He no doubt contemplated that there would be fair, wide open, intelligent and discreet dealings among men.

Unfair, secretive, incomprehensive, indiscreet and uncertain competition should and must be condemned —it reflects ruin, disorder, disaster and loss—it makes enemies among men, it creates a sad and mean feeling and possesses one of the devil, casting gloom and darkness everywhere. Its the exact opposite of sunshine and happiness.

As an illustration: Six millwork factories called upon to figure a set of plans for a special house bill —all of these factories kept their books in a systematic manner, all have some approved system of keeping cost, each one knows what he is doing and can do, each have estimators properly qualified who are constantly provided with cost records covering labor, raw materials and overhead expenses or burdens. Their bids go in and run about as follows:

Factory No. 1	$9,865
Factory No. 2	9,800
Factory No. 3	9,640
Factory No. 4	9,580
Factory No. 5	9,275
Factory No. 6	9,000

The bids are opened on a certain day, each factory has his man call to see how he stands for getting the order. Factory No. 6 is awarded the business. The others remark; 'This is some mighty close figuring boys," feel satisfied, congratulate factory No. 6, go merrily on with no hard feelings, no complaint, and with an air of confidence and satisfaction. Why?

Four other factories are called upon to figure another set of plans for a special house bill—all of these factories keep their books in their pockets or scattered around the office on hooks, in the table drawers or on top of the table—some of them put in a cost system last year but it cost too much to keep it up and dropped it—their "guestomators" are put to work with no knowledge of wages, cost of lumber and no information about overhead expenses and are told to "go to it, we are short on orders and want that bill and remember the last bill we figured against competitor Smith he beat us 40 per cent; don't let him get away with it this time."

The result of this logic is that the bids go in about as follows:

Factory No. 1	$9,685
Factory No. 2	6,750
Factory No. 3	6,300
Factory No. 4	4,500

And then what happened?

The customer very clearly sees the very wide variation and nine chances to one calls in Factory No. 4 and says: "Here, old boy, we promised you the preference on this order, 'but you are too high,' bring down your price to $4,000 and we close the order with you now." Factory No. 4 scratches his head a little and says, "How about the other bids." Friend customer says, "All right, if you don't want it I'll telephone 'Smith' and he will come up at once and I will sign up with him." The trick is turned. Factory No. 4 says: "Give me $4,250 and I take the order." The customer hands over the order and then comes the fireworks. The other factories come along and observe that factory No. 1 has outguessed them to the tune of difference of $5,365, $2,250 and $1,800. They, of course, go away disgusted, feeling mad, mean and with murder in their hearts. Old man Smith has three confirmed enemies for evermore and eternity. Factory No. 4 goes in with the order and no doubt looses a few thousand or more and never knows it, but at the end of the year he beats his chest and pleads with his banker about renewing that note and goes off hunting or to the woods, when he gets a letter from some of his creditors saying that they will be up to see him next week.

A little further on, friend customer turns down all the inside trim, the stairs and raises cain about things in general. The architect sends over full size details that were never seen before, and so it goes. And forever afterwards these four factories fight each other as cats and dogs and refuse to serve on the church council with each other. What a contrast—what a difference between the fair and unfair, the intelligent and the incomprehensive, the discreet and indiscreet, the certain and uncertain and between them who love and admire each other and them who hate and envy.

A membership in some reliable trade association will smooth out all of these wrinkles, it will make friends, satisfaction and happiness.

*Secretary, Southern Sash, Door & Millwork Manufacturers' Association.

Dry Kiln Heating System, Automatic Control

Even Distribution of Heat First Essential—Length of Drying Period Not Most Important Item—Uniformity of Results the Test

By Benj. D. Curtis

As an illustration of the laws of evolution when applied to industry, I have seen within the last ten years, a complete change brought about in the design and construction of Lumber Dryers. It has only been a few years back when nearly all Dry kilns were built in the form of a long tunnel, operating on a progressive method of drying, where the lumber went into the dryer at the loading end, passed through progressive degrees of heating and humidity and being moved from the other end in a dry condition. It is not only natural but desirable in this type of

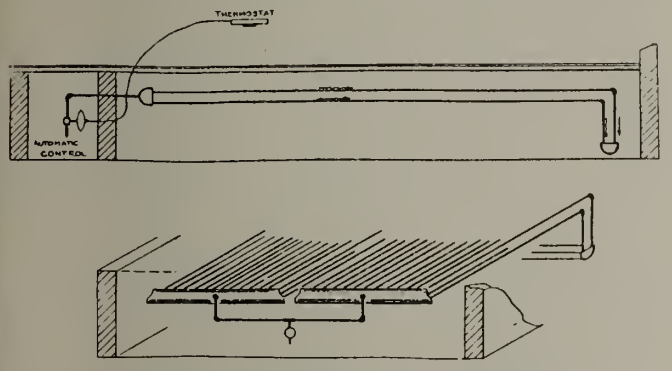


Fig. 1. Typical horizontal header system.

Dry Kiln to have the Heating System designed so as to produce a graduated temperature and relative humidity.

To-day, the progressive type of dry kiln has gradually given way to the more improved type of what is known as compartment dry kilns. This change in the construction of lumber dryers has been brought about on account of the more complex manufacturing conditions of wood-working industries principally because numerous additions during the last few years have been made in the commercial woods. Wood-working industries that a few years ago would have been using only one or two kinds of woods would probably be found to-day using from a half dozen to a dozen different kinds. This naturally means that the dry kiln equipment must be designed to meet these changed conditions.

Importance of Heating Unit

In the compartment type of dry kilns the kiln is filled entirely at one time with woods of uniform dimensions and texture. This means that to uniformily and evenly dry the entire kiln full of stock it is absolutely essential to have even distribution of the drying elements—heating, humidity and ventilation.

The heating system is the heart of the dry kiln, as it is the heat that produces the motive power for moving the air currents, therefore, a faulty designed heating system that does not uniformly distribute the heat over the entire kiln would naturally cause uneven circulation of the air currents and produce uneven drying of the stock. I have seen a great number of improvements in the last few years in dry kiln construction but I feel safe in making the statement that there has been less attention paid to the proper designing of the heating system than to any other part of the kiln. In fact a number of heating systems installed in dry kilns to-day are practically the same as were used in the old progressive type of kiln.

Even Distribution Essential

The modern type of compartment kilns are generally built in batteries, each compartment arranging from 20 to 50 feet in length. In the operation of a compartment dry kiln the temperature is generally started at 110 degrees or 120 degrees and gradually increased from day to day finishing at 160 degrees or 170 degrees. Most of the kilns being installed now are equipped with automatic controls for controlling temperature and humidity. With an automatic control attached to the heating system it is only possible to control the temperature inside of the dry kiln at the point where the thermostatic control is located, therefore, if the heating system is designed in accordance with Figure 1, and it is desired to set the control so as to carry 110 degrees of heat this would mean that as soon as the temperature reached 110 degrees at the thermostat inside of the dryer the steam valve would be throttled down and this would set up a condition whereby the heating system would not receive enough steam to reach the opposite end of the heating coils and would thereby cause uneven temperature between the two ends of the dry kiln.

The heating system shown by Figure 2, while an improvement over that shown by Fig. 1, will also bring about an uneven heating condition. This heating system is constructed in units so as when low temperatures are desired all but one or two of the units can be closed off. This would bring about even distribution lengthwise in the dryer but would cause uneven distribution crosswise. It also has the

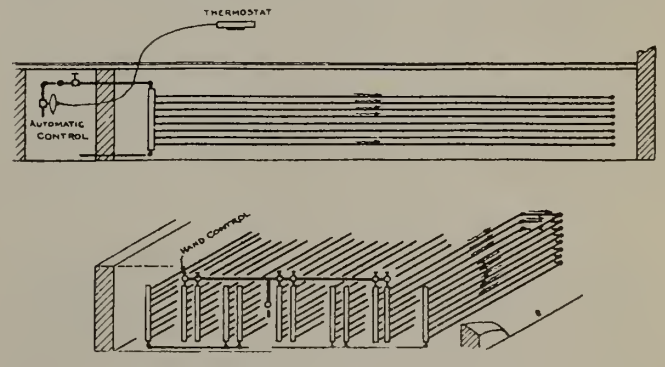

Fig. 2. Vertical multiple unit header system.

disadvantage with automatic control of being only semi-automatic, as the separate units desired have to be controlled manually and cut in or out as the temperature is raised or lowered.

Assists Automatic Control

The heating system shown by Figue 3 is a new method of design that has been especially arranged for compartment kilns, and to also work in harmony with automatic control devices. This heating system is a multiple unit system with return bend coils. The

separate units are connected to one main supply to which the automatic temperature control is attached and the steam is distributed evenly crosswise in the dry kiln and an even distribution is also secured lengthwise by use of the return bend system. The temperature in a dry kiln with this heating system can be gradually raised from 110 degrees to 170 degrees and automatically controlled. Whether the temperature desired is 110 degrees or 170 degrees an even distribution of the steam and heat is always insured both crosswise and lengthwise in the dryer thereby insuring even circulation and eliminating uneven drying of material.

While I fully believe in automatic temperature control for lumber dryers, I contend however, they are

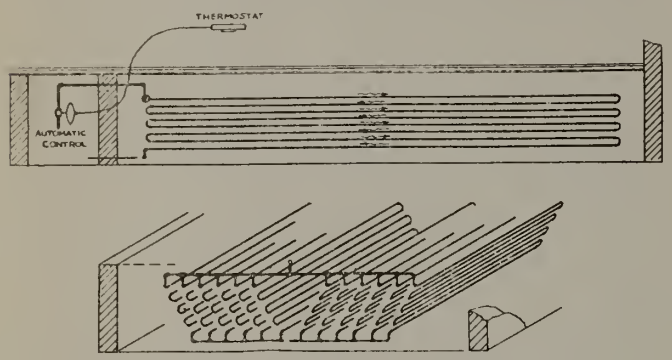

Fig. 3. Multiple unit, semi-vertical, return bend system.

of but little value unless the heating system inside the dry kiln is so designed that it will work in harmony with the temperature control. Nothing will be gained by the operator by having an automatic temperature control on the dry kiln unless he can absolutely depend on the heating system giving even distribution over the entire dry kiln at any temperature desired. As stated in the forepart of this article, the temperature control can only control temperature inside the dryer at one point, i.e., where the thermostat is located.

In operating a dry kiln the operator has nothing to guide him as to what the conditions are inside of the dry kiln except the recording thermometer, if he is fortunate enough to have one of these on the dry kiln, and the same is true of the recording thermometer as of the automatic temperature control. It can only indicate the temperature at one point inside the dry kiln, and if the heating system is unevenly distributing the heat, the operator has no way of knowing this from the recorder on the dry kiln.

Heart of Dry Kiln

It will therefore follow that no dry kiln produces uniform and even drying of the lumber by equipping it with recording thermometer and automatic temperature and humidity controls unless the mechanical equipment inside the dry kiln has been properly and carefully designed so as to produce the conditions desired, so that the operator may know, if his recording thermometer and automatic controls are set to secure a predetermined condition over the entire dry kiln.

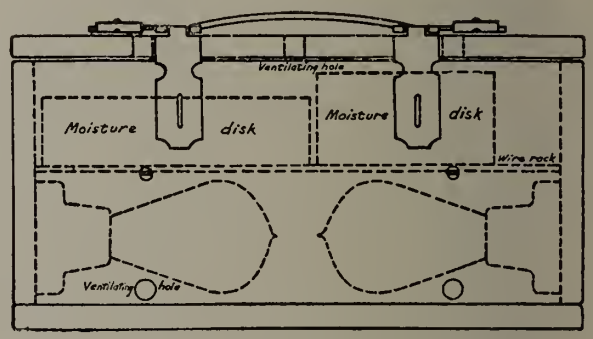
Lumber that has been unevenly dried will cause more trouble when manufactured, than if it had not been dried at all. The dry kiln that is so designed and constructed that will uniformly dry lumber is a more valuable asset, even though it takes twice as long to dry the lumber, than a dry kiln that produces uneven drying. The whole success of uniform drying in a lumber dryer is in the design of the heating system. The heating system is the heart of of the dry kiln, and if the dry kiln has heart trouble it is certainly time to consult an expert.

Portable Electric Drier for Drying Kiln Samples

The Forest Products Laboratory has devised a portable electric drier for drying moisture-determination disks. It consists of a sheet-iron box 4 in x 13 in. x 6¾ in., lined with a layer of asbestos one-half inch thick. The heat for drying is supplied by two 40-watt, carbon-filament lamps placed in the bottom of the box. Immediately above these lamps is a wire screen on which the disks to be dried are placed. Ventilation is obtained by eleven holes, ⅜ inch in diameter, six of which are in the cover, three in the back near the bottom, and two in the front A cord and plug attached to the drier make it possible to connect it to any lamp socket.

Inch disks are easily dried in this apparatus in twenty-four hours. The maximum temperature attained is 230 deg. F., which is reached only if the disks are allowed to remain in the drier for several hours after they are bone-dry. A slight scorching of the disks occurs under these conditions, but for all practical purposes this does not cause any appreciable error in the moisture calculations.

The weight lost by the disk in drying is the weight of the moisture that was in it. This weight divided by the weight of the dry disk times 100 gives the



Electric drier that may be attached to any lamp socket.

percentage of moisture in the stock in the kiln at the time the sample was removed.

This drier is very well adapted to commercial practice. It can be carried around the plant, and used in any place where a lamp socket is available. It may be enlarged by increasing the width and the number of lamps.

A Radical Departure

In describing a new type of phonograph which the British Polyphon is attempting to place on the British market, an English contemporary, says that the introduction of this machine is an interesting departure and one fraught with many pitfalls. A touch of humor is lent to this remark by the illustration which shows a case copied from a Canadian upright cabinet in Jacobian design. As the market for upright cabinets is developed it should mean some business for any Canadian phonograph men who care to go after it.

When cutters have to be made in a mill, it is advisable to use a good carbon steel so that they can be properly hardened.

Canadian Pianos in Scotland

Construction Might be Cheapened—Could European Methods of Finishing be Adopted to Advantage

By Gordon B. Johnson

Canadian pianos on sale in Scotland possess many admirable features and compare very favorably with English and German makes. It is gratifying to observe this, and to see the result of this important branch of Canadian industry in the finished article standing alongside competitive makes. The market is quiet at present in common with most other trades, particularly those which are most affected in periods of depression such as the world is now undergoing.

It is perhaps unnecessary to say that the greatest opportunity for an outlet for pianos in this country is in a good sound article at a comparatively cheap price. Pianos laid down in Glasgow at a price to the importer of £50 to £55 have the readiest chance of attracting customers. It is stated by one of the largest importers and dealers in Scotland that Canadian prices are too high. Adverse exchange and freights partly account for this, but both are in course of improvement, and in manufacture itself prices might be materially reduced without impairing the quality of the instrument.

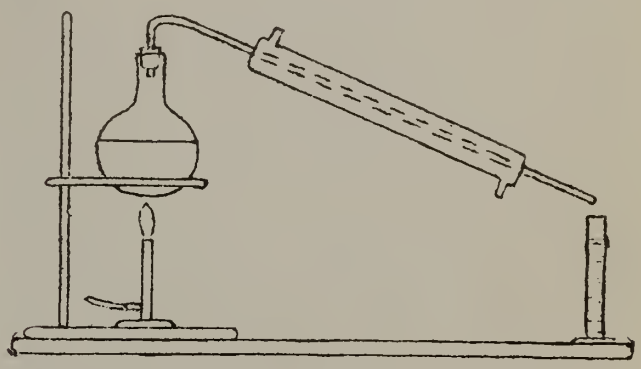
For example, in one make of comparatively low price four heavy posts of hardwood are used at the back of the case as a structural support. It is said that these are not needed, a much lighter form of construction, and of pine wood, being quite sufficient, resulting in a considerable reduction in cost. In another Canadian make, the case is built of 5-ply wood, evidently with the object of protecting the instrument against the extremes of temperature experienced in Canada. Such construction is not needed here for that purpose, and apparently a 3-ply casing could be adopted.

In the matter of varnishing and polishing there is an opportunity not only for a reduction in manufacturing costs, but also for a considerable improvement in quality. This is a most important point, as the American system used in Canada is distinctly inferior in its result to the practice in vogue in England and Germany. The Canadian pianos on view here can be easily scratched with the thumb nail, while the English and German makes have such a hard finish that it is difficult if not impossible to make any impression on it. On these instruments French polish is used. The French system consists in oiling the bare surface, then filling it in until all pores are closed up. Afterwards it is varnished with thick varnish, allowed to stand until hard, and then sand-papered. This varnishing and sand-papering is repeated three times. The next operation is finishing off in thin varnish of spirits and oil. It is stated that the Canadian method of varnishing costs $25 to $30, whereas the French system would cost $10 to $12. Canadian manufacturers who have been advised by importers here to use the French method have replied that French polishers cannot be had in Canada. They are available in Glasgow and could no doubt be induced to try their fortunes in Canada.

The question of design in external is an important one. What suits Canadian taste in this respect is not necessarily appreciated in this country. The only difference which arrests the attention is the portion of the case which closes over the keyboard. The Canadian design in this feature is squared in section, and works on two sets of hinges. The easily-marketable piano here must be rounded in section and work on one set of hinges. A change in this respect to suit the taste of the buying public would affect sales favorably.

Determining Moisture Content of Wood

A method used by the Forest Products Laboratory for determining the amount of moisture in chips and sample borings from large pieces of wood requires little equipment and only a few minutes time. The moisture content of pulpwood chips can be found by this method in from 7 to 10 minutes.



Device for quickly determining moisture content of sample borings.

A specified weight of wood chips, usually 100 grams, is immersed in kerosene in a flask or retort, and the mixture is heated. The water in the chips changes to steam at 212 degrees, and goes out through a glass tube in the cork of the flask, is condensed by a water jacket surrounding the tube, and caught in a measuring glass. The boiling point of kerosene being higher than that of water, all the moisture will be driven off the chips before the oil vaporizes to any great extent. The oil that does go off in the form of vapor is condensed and caught in the same graduate with the water. When the evaporation of moisture is complete, the oil and water are allowed to remain a few minutes until the water has all settled to the bottom of the graduate. The amount of moisture in the wood chips is then found by a direct reading.

This method has been checked for accuracy with the method of weighing samples before and after oven drying, and the variation found to be less than one per cent.

Highland Stock Softer and Finer

Harold E. Everley, assistant sales manager of the W. M. Ritter Lumber Co., Columbus, Ohio, takes exception to a statement in the article entitled "What Kind of Oak Do You Prefer?" which appeared on page 95 of the April "Canadian Woodworker." The suggestion is made in this article that wood grown in the warmer, milder climate of the South is softer in texture and possibly more even and finer in grain than that grown in the more rugged northern climate and that timber from high-land is harder in grain and texture than that from low-land. Mr. Everley states that the opposite holds true; that woods grown on high-land are softer in texture and finer in grain than low-land stock. The reason for this is that the timber on high-land does not grow as quickly as that situated on low-land.

Situation Calls for Close Co-operation

Base Costs on Replacement Values—Freight Rates Keep Lumber Prices High—Immense Field for Development—Box Industry Basic One

By B. F. Masters, Chairman, Board of Governors*

(Concluded from April Issue)

I think it is a fundamental principle in business that a man can't sell his goods below cost. We have stood upon that principle, and I think as a principle it is still true and still a good one, but in our industry it is probably wise in many instances to sell our product below cost because we must with other industries suffer the deflation and liquidation to which I have just referred, and if we sell it below cost the next test is the replacement value. I do not think men are foolish to sell their product below cost so long as they are getting as much or more than they could replace it for. If we have large inventories of lumber that cost us a great deal more than it is selling for today, many lines of lumber have shrunk in value from 40 to 50 per cent., it may be good business to sell your product upon the basis of what you can produce it for on the replacement value of lumber.

Now that alone is an opening, not an opening but an opportunity I may say for the people to go out and sell their product at a low price, feeling in their own minds that they are going to replace their lumber later on at a still lower price, and the tendency has been, and prices have been made recklessly and freely everywhere without regard to the cost, market value or replacement value, market values changing perhaps, and a very difficult and intangible item at this time with the fluctuating prices in lumber. I am speaking more particularly of Chicago because with the various sources of supply here there is less stability in the price of lumber perhaps than any other commodity sold on the market.

Consider Your Competitor

But after all, are we not in the same boat, and do we gain anything by attempting to reduce our stocks of lumber and keep our factories in operation by quoting prices that take some other man's business away from him and puts it into our shop? My thought of the whole thing is that we have become a little panicky as an industry, that we have failed to recognize the principles of reciprocity that this Association was governed by for a great many years, and successfully governed by, and which led to the higher plane of development, of mutual confidence and of the courtesies of the trade and the ethics of the trade than any other principle that we have ever applied in the box business.

Let us not get away from that. Let us keep this thought in mind that whatever your burdens may be you are in the same class as the other fellow. I find as I talk with my friends in the business I get some comfort out of it, that I am not much worse off than they are. I find it is not always true that a man who goes out with a very low price and tries to take your business away from you is able to produce it for any less money than you are. He is just frightened a little more than you are or he needs the money worse than you do or possibly thinks he is a little smarter than you are, and wants to scoop some of your trade and keep his factory running. I think that this tendency is dying out year after year, because as we know each other better we find we are all pretty smart and the fellow who thinks he has it on the other fellow generally gets left.

I do not suppose there is any industry better able to meet the conditions confronting us today than the box industry. I think the lumber industry upon whom we depend for our raw material have had more vicissitudes to meet than we have had. I think they are still having greater difficulties. In many sections weather has contributed to that to a greater extent than it contributes to the box industry. I am speaking of that as an industry separate and apart from the lumber industry, though many box manufacturers manufacture their own lumber and in that event they have the same conditions that the producer of lumber has.

High Freight Rates Responsible

In connection with the cost of raw material I am not here to apologize for the high prices of lumber on the part of any lumber men who do overcharge us, but we must not overlook certain fundamental facts and that is that the advance in freight rates has a great deal more important bearing upon the delivered price of lumber than any advance in the cost of lumber or in the price of lumber. As a concrete instance of what I have in mind, I will not go to the extreme of the Pacific Coast but take the southern lumber that comes into the Chicago market on a rate of perhaps 42 cents or $14 a thousand, freight deducted from the f.o.b. Chicago price leaves about $8 for No. 2 gum in Chicago. That is a specific example; it leaves about $8 for f.o.b. the mill. I can remember when we paid $16 for gum, and freighted it for $8, and it still netted the mill men $8, and they said they couldn't make it then at any profit, but they are selling that lumber today at the same price f.o.b. the mill as they did fifteen years ago, but there is a difference of six or eight dollars a thousand attributed entirely to the advance in freight rate from which nobody gets any benefit, not even the railroads, because of the cost of transportation.

There was a meeting in Memphis about two or three weeks ago. The hardwood manufacturers were petitioning the southern railroads for a lower rate on low grades of lumber. I think they wanted to work it out upon a basis of the ad valorem rate, that the price of lumber would regulate the rate to some extent. There may be a lot of objection to it, but the railways said' Will you increase the tonnage if we make you a lower rate on low grade lumber? The lumber men put up the further argument that under the present conditions there was a great amount of timber, a great number of logs left in the woods to rot, because they could not market it at a profit and I think you all know that that is true. Lumber men are not cutting their timber as close. They are letting trees stand in the forest because they can't get the cost and the freight out of them. They are leaving top logs that would have a value for box material if it could be marketed. Well, the lumber men would not give any assurance in that respect, and consequently no action was taken and probably will not be, but for years we have been talking about conservation, conservation of our forest

*Address National Association Box Manufacturers, Chicago, Ill.

products, and we are confronted today with a condition that instead of being conservation is forcing absolute extravagance. Who is to blame for it? I don't know.

Work for Good of Industry

I do not know of any panacea that will cure all these ills. The only thing I know is to go ahead and do the things we have been doing for a number of years, for twenty years, that is, working together shoulder to shoulder through this Association to protect ourselves against these ills that are thrust upon us and against ills that thrust themselves upon us, and against all the adversities that our industry is heir to by nature of its environment and condition. There is no ponacea that will cure trade ills of today. There is no one thing that will turn this old world around and head us the other way. It takes a combination of all the good things that the minds of men can contrive and work out.

We need this Association because there is no other organization through which our mutual complaints and our mutual requirements and necessities can be handled. I do not mean by that that local or district at present in this association in which the problems are the same as they are in all other districts, and there are many problems that confront our industry as a whole that are mutual and affect us all just the same. Therefore, the membership of these various districts through the national body affords to my mind the best and the only means of continuing to work out the problems that confront the box industry of the country today.

Push Publicity Campaign

I know it is difficult to become enthused over Association work just at this time when we do not see tangible results. It may be difficult to recommend and to spend our money for advertising because we do not see tangible results, but advertising is perhaps the most intangible thing that enters into business, and yet advertising men and men who have made a study of it will tell you that they can sell anything at all if it is properly advertised. The result is intangible so far as placing your finger upon the point of origin, but everybody knows that nation-wide advertising has brought prominently before us many things that are today being marketed extensively and profitably, things that at one time perhaps failed because they were not properly marketed or advertised and brought before the public. So the wooden box has its place in this advertising campaign. I could not tell you the last number of shippers, in fact, I would hesitate to make a comparison of the number of packages that are used in shipping the commerce of the United States that moves in other than wooden boxes. You have an immense field for the development of the wooden box. Our business is just as essential as any industry in the United States. Let us not for a minute get the thought in our mind that we are engaged in an industry that is becoming obsolete, or that ever will become obsolete, because we will use wooden boxes as long as we are here to make them.

What we need is a faith in that principle, a faith in our industry, a faith that we are engaged in an industry that is essential and necessary, a faith that we are engaged in an industry that is legitimate, in an industry in which we can help each other through co-operation, a faith in this Association, a faith in each other, and if we adhere to that principle I am sure the future has better things in store for us than we have been enjoying for the past few months. I thank you.

Box Manufacturers Must Sell Service

"He who serves best profits most." The box manufacturer is in a position to give a form of service to his customers that will win business and foster goodwill. He will prosper just in proportion as he is able to serve. There is more to a box than two sides, two ends, a top and a bottom and there is more to selling boxes than beating the other fellow's price. If you have studied the strength, construction and design of boxes and packages so that you are able to work out a set of specifications covering a box for a given purpose and can convince your prospective customer that your box will carry the goods safely, keep freight charges down to a minimum and save time and labor in the packing and handling of the product, service becomes the first and price the second consideration. Your ability to give this service will also determine whether you secure business on a price or quality basis.

That proper design, proper thickness of material and proper nailing and strapping play an important part in the box industry, should not need discussing. To-day we are not selling just so many pieces of dressed lumber but so many shooks or boxes that will stand up and give service, at a minimum cost and with a minimum loss. If in this endeavor to produce a box that will stand the racket the material used is heavier than necessary the customer and the ultimate consumer pays: First in the higher cost of the box, second in higher freight charges, and third, in damaged goods and loss of contents, for it has been demonstrated that a box made of needlessly heavy material will break down quicker than one constructed of lighter but more suitable stock. It is estimated that the excess material furnished by box manufacturers in one year, that is the excess consumed in making boxes and shooks needlessly thick, amounts to 1,500,000,000 valued at $120,000,000. This a direct loss to the manufacturers. In addition there is the freight which is paid on this large quantity of useless material.

On the other extreme are found the boxes that are too light, that do not carry through, but spill their contents here and there,, while on the road to their destination. A box that does not give satisfaction is a source of untold annoyance, it injures the reputation of wood boxes as good containers, results in endless strife, damage claims, ill-feeling, loss of time, loss by theft and general dissatisfaction.

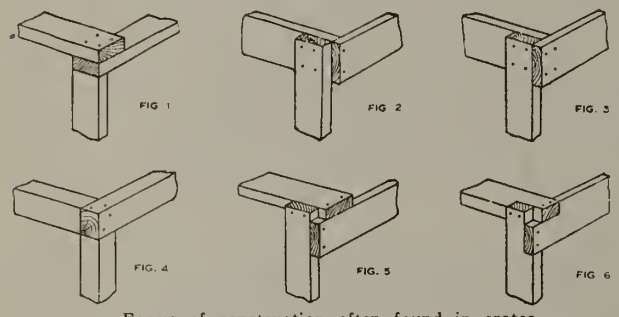
Between the two, lies the ideal box, designed to carry a specific article and deliver it safely at a known destination. It is neither too light or too heavy, it is properly reinforced with strapping and braces and is nailed to give maximum service. In other words, it is the most box for the least money. The box manufacturer who has studied his product, its design, application, construction and service given and expected, need not fear his competitors nor the competition of substitute containers, for he is able to consult with his customers and advise them as to what is best suited to their requirements, save them money and give 100 per cent. value.

Corner Weakest Part of Wooden Crate

"Three-Way" Construction Gives Best Results—Nailing to End Wood to be Avoided—Suggestions for Nailing and Bolting

The corner is the weakest part of the ordinary crate. Some facts about crate corners observed in tests at the Forest Products Laboratory may be of assistance to crate builders in strengthening this weak part by better arrangement of members and methods of nailing or bolting.

An example of expert crating frequently met with is that shown in figure 1. This construction is poor because the nails holding one member are driven into end grain and so have comparatively low hold-



Forms of construction often found in crates.

ing power. Another common example of the same fault is shown in figure 2. This construction may be improved (fig. 3) by lengthening the member to permit nailing into the side grain.

Construction to be Avoided

The corner construction shown in figure 4 is very weak, because the only nailing possible is through one member into the end grain of the other two. This style of corner is frequently used in crates which are to be entirely covered with sheathing. In a crate without sheathing it would, of course, be worthless.

In figure 5 each member is nailed to another member and has the third member nailed to it. This is a very effective arrangement. It is called the "3-way" corner, and the distinguishing feature is that each member is held by nails or bolts in two directions. Figure 6 is suggestive of further variations of the 3-way principle, with the members notched together.

Seldom if ever does the 3-way corner construction increase the volume of the crate. On the contrary it usually reduces the space occupied. When properly nailed or bolted, this type of corner has a considerable bracing effect, although it does not do away with the need for diagonal bracing.

Types of "Three-Way" Corner

The sixteen possible arrangements of members at a 3-way corner are given in figure 7. It will be seen that A and I are the most practical when the object to be crated is a box-like form, such as a filing case. When the object is of irregular form, such as an electric motor, one of the other arrangements may have the advantage of permitting better bracing and blocking.

Proper arrangement of members will not in itself produce a good corner. They must be properly fastened together. Whether bolts or nails should be used depends principally on the thickness of the members, the amount of stiffening afforded by sheathing, and labor costs.

Nails driven in holes slightly (1/32 to 1/16 inch) smaller than their diameter have considerably more resistance both to direct pull and to shear than nails driven without holes.

Cement coated nails are superior to uncoated nails.

Length of nails should be somewhat more than twice the thickness of the member holding the heads.

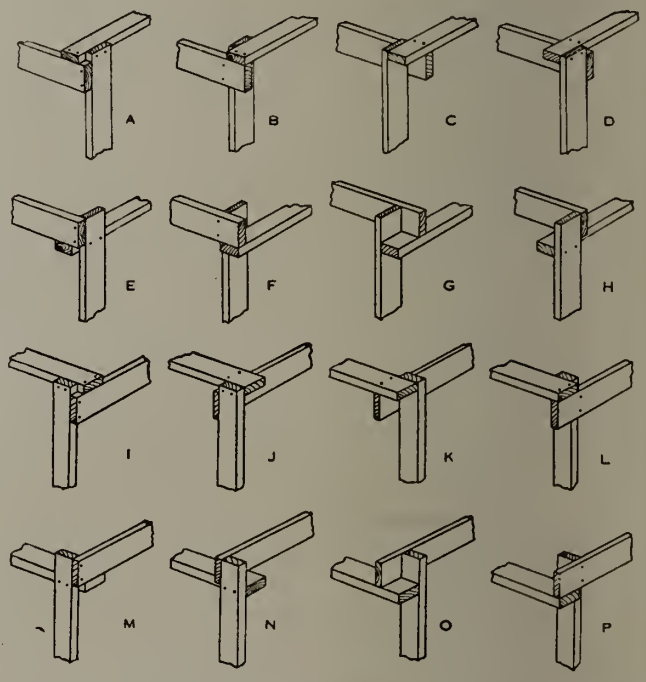
Slender nails are likely to hold better than thick nails under the repeated shocks and constant weaving action to which crates are subjected, because the slender nail bends near the surface of the pieces joined without loosening the friction grip towards the point.

Number of nails or bolts joining one member to any other member should not be less than two. Usually as many nails as can be driven without splitting should be used.

Danger of splitting will be reduced if nails are staggered. Boring holes for nails also reduces the danger of splitting.

Bolts Make Strongest Crate

Bolts have the advantage of holding after the friction grip of the wood on the shank is destroyed. The following schedule of bolt sizes is suggested as a guide:



Different types of 3-way construction.

Thickness of crate members	Diameter of bolts
Up to 1½ inches	⅜ inches
1½ to 3 inches	½ inches
3 to 5 inches	⅝ inches

Machine bolts should have washers and the heads should be countersunk.

Carriage bolts are preferred to machine bolts and may be used without washers under their heads.

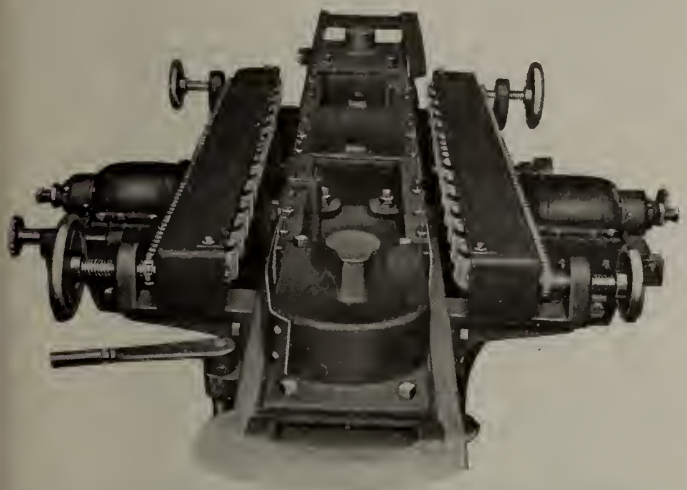
Nuts should if possible be on the inner side.

Holes for bolts should be bored to the same diameter as the bolts—or 1/32 inch smaller.

Machinery & Equipment

Direct Motor Driven Glue Jointer

One of the latest developments of ball bearing direct motor application is the No. 429 Automatic Glue Jointer and Edge Molder, which J. A. Fay & Egan Co. are making at their plant in Cincinnati, Ohio. The new development is creating quite an interest in the woodworking industry. This latest model is made with a series of extra pressure rolls at each cutter head, so that it can be used as an edge molder



Ball bearing, motor driven glue jointer.

working stock as short as 4 in. at a greatly reduced cost as compared with work done on a shaper, jointer or tenoner. These extra rolls improve the quality of work on long stock by holding it rigidly while being passed over the cutter heads. Particular attention is called to the extended table model for planing out of wind and jointing long stock, such as is used in building tanks, silos and aeroplanes. This machine works material from ¼ in. to 3 in. thick and from 1 in. up to any width, and 4 in. up to any length desired. Table is made in three lengths. The frame is cast in one piece, insuring absolute rigidity. It is cast open and all parts are easily accessible. One important feature in its construction is that all the bearings are oiled from the outside and therefore it is not necessary to stop the machine to oil any parts. The No. 429 is equipped with individual high speed motors mounted in housings directly on spindles. Motors are alternating current only for two or three phase; 60 cycle and any voltage.

Direct Motor Driven Mortiser

Another application of direct motor drive in the construction of a woodworking machine is shown herewith. It is a Whitney Horizontal Bit Mortising Machine, manufactured by Baxter D. Whitney & Sons, Winchendon, Mass.

A high speed alternating current motor is mounted directly on the spindle. The motor housing is a part of the head block that carries the spindle and bearings all of which slide back and forth as a single unit to make a mortise of the desired size. This application eliminates all extra bearings as the same bearings serve for the spindle and the motor.

The table is supported on a knee that is raised and lowered by means of a handwheel which quickly sets it for the various sizes to and from the bit by means of a conveniently placed lever that operates a rack and pinion feeding mechanism.

The head block carrying the spindle and motor oscillates from side to side through a distance equal to the length of the mortise to be cut. The movement of the sliding head is such that the end of the bit travels on a straight line and makes a mortise of uniform depth the entire length. This block is driven horizontally back and forth by a motor through a crank shaft, which in turn drives a connecting rod fastened to the head block. The ends of the rod can be adjusted to give the desired stroke to the head block to cut any length of mortise up to 6 inches. The head block has two rates of feed, 150 and 200 strokes per minute. The change in the feed is secured by the operation of a lever.

The machine will cut any size mortise up to 1½ in. wide, 4½ in. deep and 6 in. long. Table will drop 5 in. This machine is also furnished equipped with a power feed for table.

Some of the advantages claimed for this type of mortising machine are: The elimination of countershaft and belts and a saving in floor space; can be

Horizontal bit mortiser, motor driven.

erected and operated in any desired place, regardless of shafting; it is an independent and compact unit; has a constant and steady bit speed and a true and even-running spindle, and there is no slowing up of the spindle due to belt slippage.

You will break the chain of the mortiser if you neglect to sharpen it.

Split Tilting-top Saw Table

A very handy combination boring machine and variety saw, with tilt table top is being placed on the market by the D. McKenzie Machinery Co., Guelph, Ont. The accompanying illustration shows this machine with half of top set at an angle, permitting bevelling to be carried on conveniently.

Handy saw showing split-tilting table and boring attachment.

Any angle up to 45 degrees may be worked. The table is rigid and accurately machined and the fences and gauges move freely. The boring attachment is complete in itself. The table is actuated by the foot lever shown. A large coil spring located in the column of the machine automatically releases the work from the bit when pressure is removed from the foot lever. The mitre fence can be set to forty-five degrees and locked in any position. The boring attachment is raised or lowered by means of a hand-wheel connected with a pair of mitre gears. The spindle is bored to take standard size bits and can be arranged for a hollow chisel mortiser if desired. Saw arbor takes saws with one inch hole. The base of this machine may be arranged for direct motor drive if required.

Killing Molds on Lumber by Steaming

Molds thrive on the surface of wood when it is moist and warm. In a dry kiln molds often develop on the surface of the lumber to such an extent that they seriously obstruct the circulation of air through the pile. This is such a decided hindrance to successful kiln drying that steps must be taken to prevent the mold growth. Various experiments have been made by the Forest Products Laboratory to find a means of accomplishing this result without injury to the lumber.

The safest method found for stopping the growth of mold on lumber in a kiln is to steam the stock at 170 of 180 degrees for a period not exceeding an hour. This treatment heats the surface of the stock sufficiently to kill the mold, and at the same time the saturated air prevents too rapid surface drying, so that the injurious effects which otherwise would be produced on the wood by such high temperatures are avoided.

Unless it is desired to relieve drying stresses at the same time, the interior of the stock should be heated as little as possible. Therefore, the steam supply should be sufficient to reach the desired temperature in 25 or 30 minutes. To accomplish this result, plenty of live steam at a pressure of at least 70 pounds gauge must be available. The size of supply line and the number and size of perforations that may be required in the steam jet line will vary with local conditions; it is impossible to make them too large or too numerous, as the quicker the steam is supplied the better the effect.

Care should be taken to see that the stock cools in nearly saturated air. Otherwise the surface will dry too rapidly, and casehardening difficulties will set in.

Electric Edge Veneer Trimmer

The accompanying illustration shows a portable electric edge veneer trimmer adapted to trimming the uneven ends of casket boxes. This machine was originally designed to trim edge veneers and is being generally used by furniture factories for that purpose. It is operated from a large lamp socket and consumes very little current. Operator slides the tool alongside the projecting edge like a flat iron; the high speed saw makes a clean, uniform cut, trimming the stock perfectly flush with the surface. Stock up to

Trimming edges of casket boxes with portable veneer trimmer.

¾ in. thick is trimmed much faster and more evenly than is possible by ordinary hand methods. Can be equipped with motor for either alternating or direct current of 110 or 220 volts.

In the modern drying plant the humidity and the heat can be regulated to suit every class of timber from green oak planks to thin pine sidings.

Upholstering and Trimming

Upholsterers in Annual Convention

Successful Gathering is Held—Questions of Interest to Industry Discussed—Hours of Work Considered

The annual meeting of the Upholstered Furniture Manufacturers' Association, held recently at White Sulphur Springs, W. Va., was an unqualified success. A gratifying number of members attended and the discussions which took place and the business which was transacted was of vital interest to the industry. The president, A. D. Gorrell, presided.

The president, in his address, touched on work of the association and conditions in the industry. He quoted from a report issued by Babson, in which it is stated that the upholstered furniture industry has about completed its liquidation of prices, and in this report it is the only craft in the furniture industry which has done so. The one branch of the industry, that has the most liquidating to do and which in fact is retarding the resumption of normal business in this particular line, is the retail section.

The practices carried on by some of the smaller manufacturers of upholstered furniture of selling to the dealer less the covering, or of having the dealer guarantee the manufacturer's account with the jobber of covering material, was condemned as being unethical. It gave the dealer an advantage in price and worked a hardship on the legitimate manufacturer who carried a stock of covering and sold his goods in a finished state. Such a manufacturer must make a profit on the covering carried and supplied, and is thus at a disadvantage in competing with the smaller man who secures his covering through the retail furniture dealer. A resolution was passed as follows: "It is the sense of this Association that jobbers furnishing supplies to the manufacturers of upholstered furniture should abolish unethical practices in the merchandising of their goods."

The question of hours and wages came in for a considerable amount of discussion. While no definite action was taken, it was suggested that a 48 hour week is too low and 54 hours too high, and that a week of 52 or 52½ hours would be a good compromise, although the attitude of many of the members present was that 50 hours constituted a satisfactory working period.

Price-cutting came in for its share of attention. It was brought out that at the exhibition held recently in Grand Rapids, there was only one instance of where a manufacturer of upholstered furniture resorted to price-cutting. It is felt that in every instance the selling price should be based on proper costs. It was suggested that price-cutting was a short-sighted policy, which, if indulged in might demoralize the upholstering industry to a point which might take years to bring it back to the position it occupies to-day. Mr. Karpen maintained that only a certain amount fo upholstered furniture can be sold, and when a manufacturer cuts his prices, he does not increase the total volume of business being done but simply takes some trade away from his competitor. In view of the fact that there is a scarcity of upholsterers and many plants are behind with their orders anywhere from four to six weeks, it would appear as if there was not any real reason for price-cutting.

Considerable discussion centered on the question of cancellations. It was felt that this evil should be eliminated and that the members take action both as individuals and as an association to remedy this serious condition. It is intimated that in many cases the manufacturers themselves are to blame. The dealer buys a bill of goods and next day a salesman for a rival firm comes along and quotes a much lower price. It is only natural that the dealer should feel like cancelling the first order and buying at the lower figure. In this connection the following resolution was passed: "Resolved that it is the sense of this meeting that all cancellation of orders is very disturbing to business, and steps should be taken that the business interests of America abolish such practices."

The next subject for discussion was the necessity for the better packing of furniture. It may not be long before the railroads will refuse to accept crates of furniture, upholstered furniture particularly, in which the openings in the crate are wider than 6 inches. The case goods people propose making a test by sending various pieces of furniture, crated for shipment, to the Forest Products Laboratory at Madison, where they will be put in a tumbler and tested under conditions which would approximate these which prevail in shipment. It is hoped in this way to obtain information as to the best methods of packing and crating.

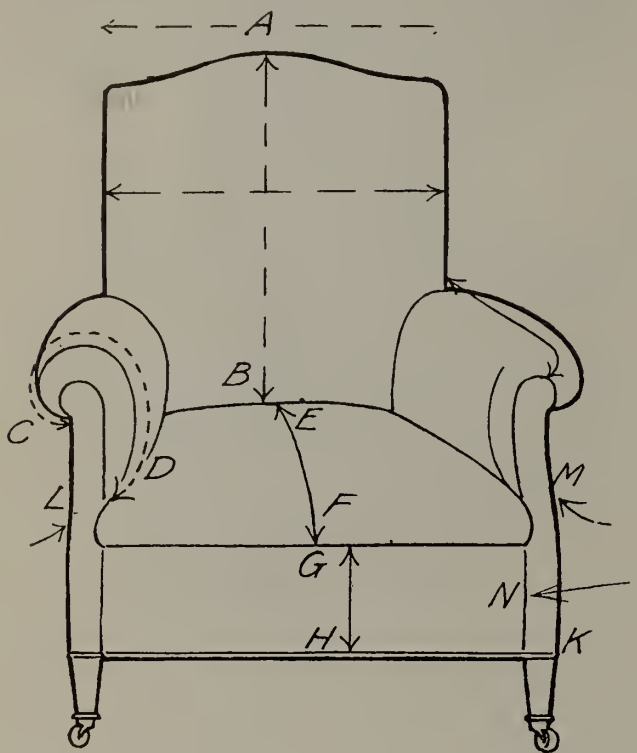
Attention was directed to the newly-formed furniture publicity bureau, of which P. E. Kroehler, a member of the upholsterers' association, is president. In discussing the value of publicity, reference was made to the results of the advertising campaigns carried on by the Simmons Co. of Kenosha. Mr. Simmons, of this firm, recently made the statement that they were going to spend $1,000,000 this year in a publicity campaign. He also stated that they expected to hold up the prices of their line, and made the further statement that the month of March was 70% of the largest month in the history of their organization. He attributed this entirely to their publicity work. He believed that if the furniture industry would spend a very small percentage—about ½ of 1% of total volume of business done in an effort to create a desire on the part of the public for better-furnished homes, the furniture business would be increased many times. The per capita expenditure in the United States for furniture is in the neighborhood of $2.00 as compared with $21.00 for automobiles. It is felt that judicious advertising would divert more of this money into the coffers of the furniture industry.

The following gentlemen were elected to office for the ensuing term—president, A. G. Gorrell; vice-president, W. H. Gunlocke; treasurer, L. L. Vallantyne, and secretary, B. D. Fennell.

Keeping Down Upholstering Costs

Judicious Use of Extensions Results in Lower Costs—Suggestions for Cutting and Planning

Extensions or straining pieces are portions of material other than the covering joined to it at various parts to increase the size. A saving can be effected by this method, but upholsterers must not overdo it, says Frederick Palmer in "Practical Upholstering." Economy must not be carried to the length of giving a maximum of extension and a minimum of covering



Chair No. 302, showing pieces of covering required

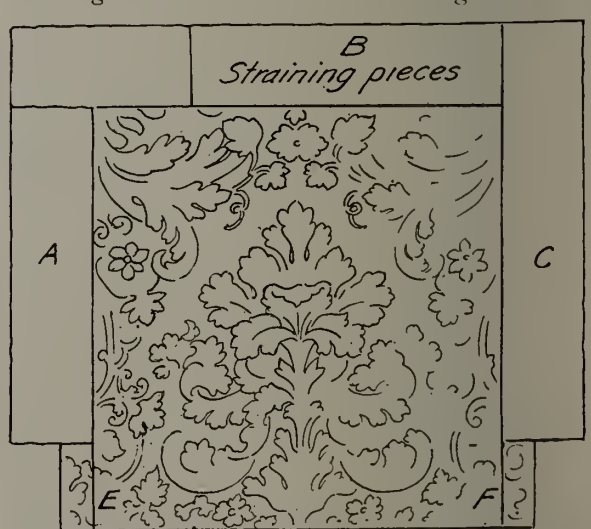
material. If it is, it becomes a source of complaint on the part of customers. The use and abuse of extensions will now be explained.

The approximate amount of double-width material needed for a chair might be 3½ yards, whereas without extension pieces this quantity would not be enough. In that case the various pieces are extended by adding strips of another material, as shown in the accompanying sketch. To dispense with extension pieces would considerably increase the cost of upholstery, and there is no disadvantage in their use if they are placed in the correct positions and strongly sewn. Extensions should be formed of a strong thin material according to the nature of the covering used. For tapestry ordinary calico strips may be used; for morocco or imitation leather black linen is preferable; but whatever the substitute it must be remembered that it has to bear a large amount of strain and pull, and that this is greater on plain work than buttoned work. Extensions should be placed in such a way that they are not visible at any part of the work.

In cases where economy has been carried too far—that is to say, where there is too little covering material and too much extension—the extension is liable to become visible and unsightly in compression, and as the purchaser is not generally aware of this device for economising material complaints frequently arise when it is found that a different fabric has been used. Thus the use of extensions, though perfectly legitimate, becomes a source of annoyance when the practice is abused. The pieces of velvet which surround rugs and carpet squares (i.e., saddle-bags) are also termed extensions.

Plain velvets and self-colored materials, when accurately measured and skilfully planned, are most economical, because no matching is required. Velvets are now woven double width, following tapestry measurements, and replacing the old-fashioned 24 in. widths, which necessitated many joins. Joins or seams in plain velvets are very noticeable, but figured velvets can be matched with ease, and in some designs they can hardly be detected unless pointed out. It is important when cutting velvet to lay the various pieces over the work, so that the shading tones correctly. As a general rule, the darkest shade of a velvet is more pleasing than the lighter ones. In cutting lengths of covering material for an ordinary stuffover chair eight or nine pieces are required, apart from those for joining. A great saving of time is effected when these are marked with chalk, commencing from a first cut, either top or bottom. Some varieties of velvet are very difficult to shade correctly, and often appear to better advantage when placed in the opposite way to which they have been cut. The cutting and matching of velvets by artificial light should be avoided. Good natural light is absolutely necessary for plain velvets, but in figured varieties not so essential, because the pattern forms a guide to correct cutting.

The beginner who is fortunate enough to learn his



How extension reduces quantity of covering.

trade in a shop in which a variety of work is done should constantly make notes. He will find these invaluable when the opportunity arises for him to cut his own materials. Many useful hints in connection with cutting can only be gained by observation. Some upholsterers waste a deal of time through planning out carelessly or not planning at all. The beginner should form the habit and strictly adhere to the rule not to commence cutting until quite sure that he has sufficient material. Careful planning creates confi-

dence when cutting, because the upholsterer has made sure of his ground and has left nothing to chance.

The best method of obtaining measurements from a double-width material is to calculate by half-widths. In cutting for small chairs, loose seats, and stuffover work, calculations are best made from the half-width. For example, the measurement of a small chair would be taken from back to front, and sufficient for two obtained from the full width. In easy chairs the half-width rule applies, and the width is increased by matched extensions of the same material when necessary. Figured designs of a set pattern in tapestries and brocades are generally duplicated in the double width, so that by cutting in the centre the pattern is the same on either side. The example shown at Fig. 302 is a simple stuffover chair for which eight distinct pieces of material are required independent of those for facings and extensions. The names of the cuts are: inside arms, outside arms, seat, inside back, outside back and border. To measure for the inside arms insert the tape between the arms and seat to a depth of 4 in. at D and measure, following the line of arrow, to C underneath the arm. The seat and back sizes are obtained in the same manner, B to A for the back, E to F for the seat, the tape being inserted at E to the depth of 6 in. instead of 4 in. The border, G to H, requires an additional 3 in. on the net measurement. For the outside arms, L and M, and outside back, A, sufficient material must be allowed to fold at the top, also 1 in. to tack underneath the frame. The planning of the material for a chair already second stuffed in a calico or underlining is less complicated than when the calculations must be obtained from the first stuffed stage. This is the chief difficulty experienced by a beginner in his first attempts at cutting out, and it is necessary for success that he should be able to visualise the work as it will appear when finished.

(Continued in June Issue)

Cottonwood for Crossbanding

Cottonwood is a difficult wood to peel, but when cut smooth and properly dried, it is unexcelled for centres, corestock and cross-banding. The fall downs make excellent egg cases, as the wood is light, odorless, tasteless and nails well. Small pieces are used for cleats, mirror backs, washboards, toys, etc.

Cottonwood must be cut with a sharp knife as the wood has a strong tendency to wool up. It is cut cold, as steaming increases this tendency to become woolly.

It is necessary to dry cottonwood slowly as it contains a high percentage of moisture, and will warp and curl all out of shape unless dried with the circulation across the grain and with the ends and centers of the sheet held down with a weight. Cottonwood has a strong affinity for mould, and if not dried promptly after cutting will sour and mould badly. It is impossible to ship cottonwood any distance green, due to this cause. The best shipping condition for this wood is about 25 per cent. moisture content.

The core or block which is left from the log after peeling has a value for pulpwood. Cottonwood cores when dried make an excellent fuel for a hot blast furnace. They are used in lime kilns, as they make a very hot fire.

The supply of standing cottonwood is decreasing rapidly, but owing to its rapid growth, can easily be replanted and grown under forest management for veneer logs and pulpwood.

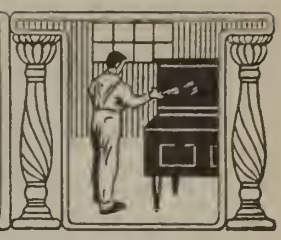
THE FINISHING ROOM



How Long Should Fillers Dry?

Writer Suggests That Five to Ten Days Not Too Long—Must be Thoroughly Hard for Best Results—Sanding Between Varnish Coats Not Required

The various methods of finishing furniture, as employed to-day in the finishing rooms of the country, make a most interesting study. It is remarkable to find how many methods are employed to obtain the same results and how the up-to-date finisher adapts his methods to his particular problem. The question of using a wash coat of shellac on mahogany before filling is one that never will be settled. Almost if not quite as many finishers fill directly over the stain as use a wash coat, though I notice that in those factories where a filler is applied directly over the stain, the work comes into the finishing room in a very smooth condition, and I also notice that in producing medium class work most factories wash coat with shellac while in the high grade work the reverse is true. But there is one point on which all well posted finishers agree and that is the necessity of having all coats including the filler coats, well dried. In fact they put special emphasis on the dryness of the filler coat before it is coated, says a writer in the "Furniture Worker." When it is impossible to allow the work to dry naturally in the required time, the drying kiln is employed very successfully.

I was inspecting one of our largest and best furniture factories recently, accompanied by the superintendent, one of the leading finishing authorities in the country. In the coating room stood a walnut suite which was intended for a wedding present for a member of the firm. In the course of our conversation concerning the suite, he quite casually informed me that he was allowing the filler to dry ten days before first coating. He had found that the longer the filler dried the better his work came through.

Allows Long Drying Period

Within the past month I have visited three prominent piano factories in the Middle West and in each case I found the finisher giving his filler coat at least five days to dry. This sounds ridiculous, I know, to the finisher who thinks the filler is as dry in one or two days as it will ever be but those finishers mentioned above have stumbled into a scientific fact quite overlooked by the majority of students of finishing. If you will flow some linseed oil on a strip of glass and weigh it every day, for two or three weeks, you will observe a peculiar condition and one quite the opposite to what most people would suppose. The linseed oil will gain in weight every day for a period of ten or twelve days, and then gradually become normal in weight again. In other words, as the oil dries it takes up oxygen from the air. It oxidizes and gets heavier in weight and while this process is going on, the mass is not inert, but changing. This change is not very great but the chemical balance shows it distinctly. Now as linseed oil is a part of the filler, this process goes on just the same in the filler as in the linseed oil, modified of course by the combination of pigment and drying oils. In other words a piece of work filled to-day and weighed to-morrow or after the volatile spirits have evaporated will increase in weight for about 10 days before arriving at a stable and unchanging condition. Those observing finishers who give their work the long drying period, whenever possible, are certain of obtaining the best results by reason of this very fact.

Judgment Should be Exercised

Of course such a long drying period is only possible on fine work and quite out of the question on the majority of the finishes made to-day, but there is always a struggle between cost and quality in the finishing room and sometimes a compromise can be affected whereby the finish is improved and the cost not greatly increased. The matter of costs is quite often a matter of individual capacity. I observed a sander recently in a cabinet shop who was as skilled in his line as any I have ever seen. He did not seem to work so fast but every motion counted. On the posts and around the carvings he sanded by hand first, and then with a block he deftly cut down the flat spaces. By actual timing it took him twelve minutes to sand a cabinet and not a corner was cut nor were any rough places to be found. He was such a skillful worker that I spoke of his ability to the superintendent who smilingly informed me that when that man fell ill, as had happened recently, it took two men to do his work. And I am not exaggerating when I say it would take a good many sanders 45 minutes to sand those cabinets as well as this particular man was doing in 12 minutes. This goes to prove that good sanders are hard to get.

Suggests Too Much Sanding

I spoke above of the compromises possible in finishing. One of the big compromises noticeable recently has been the elimination of sanding between coats of varnish. It has been contended for a long time by certain finishers and some varnish manufacturers as well, that it was quite necessary to sand down each coat before the succeeding coat was applied. It was believed that by doing this the nubs were cut off, which would otherwise protrude through the next coat and in addition the roughing of the varnish made a foundation to which the succeeding coat adhered. There was one class of finishers, however, which thought otherwise. The finishers said—use more care and don't have so many nubs and do not sand at all. They put coat over coat and obtain splendid results. I refer to the piano finishers and it is quite interesting to see how this method of finishing is gradually finding favor in the furniture factories. It saves labor and material and it always was a question as to whether the sanding did not gray the varnish. Besides, a nubby surface sanded off is no better than one directly coated over, for in each case there is unoxidized or soft varnish that should be dried through before being recoated. There is no question but that

in the elimination of sanding between coats you are getting the benefit of all the varnish you have applied with no sanded off edges to be taken care of.

Wages in Upholstering Industry

The National Association of Upholstered Furniture Manufacturers recently completed a wage survey of that industry. Information was gathered from 60 plants situated in various states. The average rate per hour paid is as follows: tally men, 57c; laborers, 42c; stock sawyer, 55c; rip saw, 49c; trim saw, 58c; band saw, 57c; joiners, 51c; planers, 51c; stickers, 59c; shaper, 61c; boring, 53c; drum sanders, 50c; belt sanders, 47c; machine helper, 35c; cabinet makers, 57c; cabinet makers' helpers, 38c; machine carvers, 65c; hand carvers, 75c; sand hands, 42c; gluers, 49c; caners, 50c; stainers, 49c; fillers, 43c; finishing sander, 41c; sprayer, 53c; toner, 54c; rubber, 50c; cutter 61c; sewer, 38c; spring setter, 41c; upholsterers, 70c; assemblers, 50c; apprentices, 47c; trimmers, 40c; packers, 49c. This survey covered the period from March 15th to April 15th, 1921.

Finishing Department Not Always to Blame

Many Troubles Formerly Passed Off on Finishers, Caused by Poorly Seasoned Stock—Foreman Should Have Working Knowledge of Succeeding Operations

By J. R. Wallace

The finishing room is often held accountable for all that occurs while the work is undergoing the process of finishing. It does not make any difference what the trouble is, whether it is open joints, warped tops, checks and face cracks, the articles were all right when taken in for finishing and the way the work was handled must, therefore, have caused the trouble. This is a very unfair attitude, for it places full responsibility upon the shoulders of the finishing foreman and his men, and in trying to find and remedy the trouble in that department, the real source of the difficulty is overlooked.

Because the joints in the top of a dresser or table open when it is being filled or stained does not necessarily mean that the staining operation is accountable. In fact it is hard to see how anyone would really try to connect the finishing with any such trouble. No doubt in the past the men in the other departments got away with a lot of crude work merely by suggesting that the finishing methods are to blame, but such an excuse does not get by any longer.

Real Cause of Trouble

The basic cause for such troubles as warping, twisting, checking and open joints is moisture and as a rule this moisture was in the wood long before it reached the finishing room, in fact was never all removed from the rough stock, meaning that the drying operations were at fault. However, the stock may have been properly dried when in the kiln but was permitted to pick up sufficient moisture to cause trouble, while awaiting entry into the factory or while going through the various operations. It is just as important to protect the stock from moisture and dampness while being manufactured as it is to see that all moisture was removed in the kiln.

The same moisture will account for warping, checking, and twisting. These troubles usually occur when moisture is being eliminated and whether the article has been given a wash coat of shellac on one or both sides or the kind of stain or varnish used has practically nothing to do with it. The same holds true when difficulty is experienced with veneered parts. Loose, blistered and checked veneers are usually attributable to the veneering operation rather than to the methods of the finishing room. Moisture in the stock is again the usual cause although loose and blistered veneers may be accounted for by uneven pressure due to a variation in the thickness of the cores or to variations in the thickness of the cauls. Here again the remedy lies outside the finishing department.

Why these troubles should develop in this particular room is that the finishing room is usually the warmest part of the plant. That being the case, it is not to be wondered at that the wood exhibits a strong tendency to dry out. This is usually, if not always, accompanied by other undesirable features. There may be rare instances, when water stain is used too freely, where the finishing can be blamed for the trouble. This usually occurs when articles on which thin face veneers have been used, are going through.

Formerly a lot of trouble was experienced from open joints and many manufacturers were at a loss as to how to account for this trouble. Now it is generally conceded that such faults as open joints, checks and warping and twisting in built-up stock are all caused by moisture in the wood. When the cause is known the remedy is obvious—greater attention to drying and keeping the stock dry. As long as there is a tendency to shoulder the finishing department with all the blame, it is not likely that the real cause will be admitted. It is up to the finishing foreman, in many istances, to convince those above and below him that the fault does not lie in the methods followed in his department and that because the articles were apparently in good shape when he received them, is no reason why he should be held responsible.

Should Know Where to Look

By recognizing that moisture in the wood is at the bottom of at least 75 per cent of these occurrences, the finishing room foreman is placing himself in a position from which he will be able to point out the cause in short order. It is up to him to defend his reputation and fight back. If he doesn't, he will often find that his position is not any sinecure. It is always well to know a little about the work as carried on in the other branches of the factory. Such knowledge often comes in handy.

A case in point is where a foreman finisher recently asked the writer how he could repair and prevent open joints in dresser tops. Naturally the reply was that this fault could be prevented by making sure that the wood was thoroughly seasoned before it was glued up. As to repairing such defects, the openings might be filled with stick shellac but unless the moisture was all out of the wood, they would probably open some more. At best repairing faults of that kind is only a makeshift proposition and should only be tried as a last resort. The better way is to remove the tops, break the joints that are at fault, dry the stock and then glue up and refinish.

Birch Takes Attractive Brown Finish

Rich, Warm Shade That Rivals Walnut—Used for High-grade Furniture—How Chrome Finish is Secured

By M. J. Dowling

The January furniture exhibitions brought out many fine examples of birch furniture finished in a rich, warm walnut tone. These pieces were received with much favor and proved to be a pleasant surprise to many, both retailers and manufacturers, who have not given the Canadian birch a second thought as a fine cabinet wood for furniture and high-class woodwork. The interest taken in these displays was such that it probably will not be long before other furniture makers will be placing birch furniture on the market. This particular finish or tone has been given different names such as "chrome-walnut," "chrome-wal" and other similar terms, though it is understood that the name "chrome-walnut" has been copyrighted and protected.

On the floor of one of the world's largest furniture stores, amid woods from everywhere and finishes of all kinds, stood the particular suite that now is in our minds' eye. It was of birch, despite the argument of those who usually know, and it seemed to reflect pride in the fact that it was so basically good and so possessed of the rich quality that was being spoken of in the highest possible terms—it was truly a masterpiece of chrome walnut finish. This period suite, distinctive because of its simplicity, was beautifully high lighted and the panels had been prepared by sanding to resemble the tones that usually come only with age. A few fine Roman gold lines gave the touch of the artistic, this being added to greatly by the treatment on the carving. Here the use of gold and a neutral shade of verde or gray-green in the depths, with a little salmon on the high lights, completed the color effect. The entire finish was produced in a few days' time, this being a feature of no small significance. A description of how this finish is obtained may prove of interest to many readers of the "Canadian Woodworker."

Ground Work Very Important

Birch being the wood in hand, it is very important that the sanding be done exceptionally well and that in the first stages the flake of the grain be fully covered. Filling can be done in the usual way and it is not absolutely necessary that it be perfect. It is vitally important, however, that a good stain be used, preferably one a little darker than ordinary Van Dyke brown. Some prefer an alcohol soluble stain to which a little acetone has been added to make it penetrate. The solid tones should be treated a little heavier if it is desired to emphasize strongly by high lighting.

The use of fine (0000) sandpaper will produce the best effect in shading and prevent defects oftimes noticed. Blend the tones well and do not make the contrast too great in the panels. Apply a sprayed coat of wood lacquer (do not confuse with metal lacquer) which contains a quick penetrating solvent that sets the color and dries in a few hours, permitting handling if necessary. This wood lacquer tends to prevent fading also, thus overcoming a complaint that, at times, is made against stained birch.

Dries in 24 Hours

Providing the sanding over the stained coat has given you the desired results, there should be no further need of sanding, but if additional tones are wanted secure them by using the fine paper again. The use of the wood lacquer should dispense with one or two sanding operations. After drying about 24 hours apply another coat of wood lacquer or a coat of good varnish. For those who admire a wax finish, it might be said that the brushing on of some thin wax after the second coat of lacquer or varnish will result in a satisfactory finish.

In the higher grade of furniture, where it is desirable to obtain an absolutely even tone, care is taken in the selection of the birch, which would mean that for each piece, material of a uniform shade and characteristic be obtained. Then if the staining process, already referred to, does not give absolute uniformity, it can be helped a lot by touching up with an alcohol stain. The entire coloring is done before finishing is attempted. Where the alcohol soluble stains are employed, they are often incorporated into a very thin lacquer solution, then sprayed with the air gun. In this case the stain is usually a shade lighter than the finished product. The air gun permits the evening up and blending of the color so that when the work is completed an absolutely harmonious and uniform surface is presented. The same procedure is also taken advantage of when high light effects are desired. The parts to be high lighted are only sparingly coated, and of course the darker parts are given more of the spray. In a measure this is largely an operator's problem, depending on the skill and eye for color shown by the man with the "gun." The operator soon becomes experienced at this, and the process is very quick. The color is thoroughly taken up by the wood because of the lacquer which carries it and which brings about the claim that fading is not as likely as if other methods are used, thus safeguarding all advantages of soluble color.

Birch, finished in this way, is endurable far beyond the usual meaning of the word as applied to a finish. It is not so easily marred, very easily cleaned and as previously stated, the entire job can be completed within three days.

To follow this method will prove the value of birch when given a proper finish. There should not be any necessity to hide the wood by giving it some high-sounding name. Those who prefer to market this wood, under its own name are assured that "Chrome Finish Birch" will sound good to the ultimate buyer, especially in view of the beautiful results obtained.

"Chrome Walnut" Registered Trade Name

The importance of the use of Canadian hardwoods in furniture manufacturing has been referred to from time to time in Canadian Woodworker, and it is interesting to note that encouraging progress has been made in this direction. The matter has been taken up by a number of furniture manufacturers and is receiving attention to a degree that it never previously attained.

At a recent meeting of the Rotary Club of Toronto, A. E. Clarke, a former chairman of the Wholesale

Lumber Dealers' Association of Toronto and a member of the Board of Directors of the Canadian Lumbermen's Association, gave an impressive address on "The Production and Uses of Hardwood Lumber," and in closing stated that the hardwood lumberman had his special place in the world, and in future when buying furniture, he, Mr. Clarke, hoped that his hearers would endeavor to purchase some pieces, at least, for their homes which were made from the products of Canadian forests. This reference was received with applause and evidently developed a new line of thought on the part of several members of the large gathering.

In retail furniture circles the problem of the more extended consumption of Canadian hardwoods in the production of furniture is coming more and more to the front. Not a few furniture retailers have from time to time made statements urging Canadian manufacturers to do more to popularize their native woods, especially birch. The Dominion possesses more birch than any other species of hardwood, while maple stands second in the list. According to the latest returns available, which cover the year 1918, the total production of hardwoods in Canada was 201,667 M feet. Of this the greatest cut was birch, which constituted 76,165 feet B.M. Then came maple with 47,884 M feet. Other species of considerably less quantities were ash, elm, basswood, etc.

The North American Furniture Co., Limited, of Owen Sound, one of the alert organizations in the furniture field, are devoting attention to the manufacture of furniture and chairs of Canadian birch, and has been particularly successful in treating them with a finish, to which they have given the name of "Chrome Walnut." The trade mark, "Chrome Walnut," has been registered by them and samples of the Chrome Walnut finish, which have been sent out, reveal a most inviting appearance. The finish is remarkable for its beauty and attractiveness. The company say they find that birch is an excellent cabinet wood.

Furniture made in the Chrome Walnut finish is not sold as imitation walnut, but as birch, and the words, "Chrome Walnut," apply only to the finish. The North American Furniture Co. say that in actual wear birch will stand up equally well with any wood and when properly finished, it has a pleasing appearance. There is no doubt if this birch was imported from some distant country, it would be regarded as one of the precious woods. We think, declares D. E. Macintyre, vice-president of the company, that every effort should be made to use more birch to the exclusion of the imported woods, especially at this time when there is an adverse trade balance against Canada, placing Canadian money at a discount.

When Saw Teeth Crumble

Who has not been troubled by crumbling saw teeth? The following explanation and suggestion by an expert saw filer may contain some valuable information:

"Whenever I found the saw teeth crumbling when I swaged them, I took an 8-inch file and side-filed them to the gauge that my shaper shaped them to; in this manner the steel of the saw tooth was worked one way and a few repetitions of this method prevented any further crumbling and a smooth cut was assured.

"In going into further details as to why I did this I will give my version of the crumbling. When teeth are swaged, the crumbling seems to radiate from the root of the swage. Now, when you work it through the shaper the steel is worked back to place. This continual spreading and compressing destroys the cohesive quality of the steel. When applying the above method, I have found that the first time, this crumbling disappears and the teeth hold their cutting edge. Always, upon taking the saw off, I note the condition of the teeth that were crumbled and if necessary apply the above method when I have to swage. If the crumbling appears again, I repeat the process.

"In addition, I might add that it is sometimes necessary to face the teeth up with a file as the grinder sometimes fails to face them up well. In my years of experience the above method has proved itself and the teeth have held up."

$1,000 Prize Won by Boy of Seventeen

Those who read our recent announcement of the award of the $1,000 prize offered by Alvan T. Simonds, President of the Simonds Saw Manufacturing Company, for the best essay on an economic subject will be interested to know that the winner, David Koch is a boy only seventeen years of age, living on the east side of New York City.

Dr. John L. Tildsley, Superintendent of High Schools in New York City, was interested to look up this boy and reported that the essay was entirely his own work, that he talked it over only with his instructor and a boy of his own age. His teacher of economics in the High School of Commerce in New York City says, "He was head and shoulders above other pupils in his economics class and knew more about economics than some of the teachers." He began to read books on economics when he was thirteen years of age, in the last year of the elementary school. He is hoping to go to college and this $1,000 which he has won will give him a good start.

Conditions in American Furniture Industry

Figures recently issued by several of the American furniture manufacturers' associations show that on April 1st the furniture industry in the States was producing at the rate of about 55% of normal. Unfilled orders averaged 27% of normal; lumber stocks 81.5%; raw materials 84%; and finished products only 96.7% of normal.

With regard to reduction of wages, 128 manufacturers were reported as having placed into effect reductions amounting to from 5% to 35% on skilled labor, the average being from 15% to 20% and 132 report reductions on unskilled labor running as high as 50% and averaging from 18% to 25%. Sixty-two furniture men had not reduced wages as yet.

This brief survey would lead one to believe that the furniture industry in the States is in a very healthy condition. The attitude of the retailers would seem to indicate that they believe that the different manufacturers are carrying heavy surplus stocks of finished material and will be forced to unload at reduced prices. By holding off, they hope to be in a position to take advantage of such bargains as may be offered. The fact that the finished products on hand on the floors of the different manufacturers have reached only 96.7% of normal would indicate the manufacturers are not to be caught napping and would seemingly show that they have reduced production to a point where it just keeps pace with the demand.

Increasing the Speed and Decreasing the Cost of Your Finishing Room Operation

How practical, how advantageous and how dependable Aeron spray-finishing equipment is, has been demonstrated in finishing rooms of every size and line.

Not merely in dozens of finishing rooms, but in thousands of them. Not only where a few different kinds of articles are handled, but where every kind, size and grade of wood or metal product is finished. Not alone where varnishes, enamels or lacquers are used, but where every kind of liquid finishing material is applied.

Aeron Finishing System (Surpasses Brushing)

Spray-finishing Equipment

offers a complete, adaptable and guaranteed service. The finishing operation is speeded up 4 or 5 times over hand-brushing. A perfect, uniform coating is applied on all jobs. Working conditions are made more healthful and safer. Operating and upkeep costs are reduced to the minimum. In all, the use of the equipment insures an improved, faster production at a lowered cost.

With your consent, we'll gladly tell you whether and how the Aeron System can be of service and profit to you.

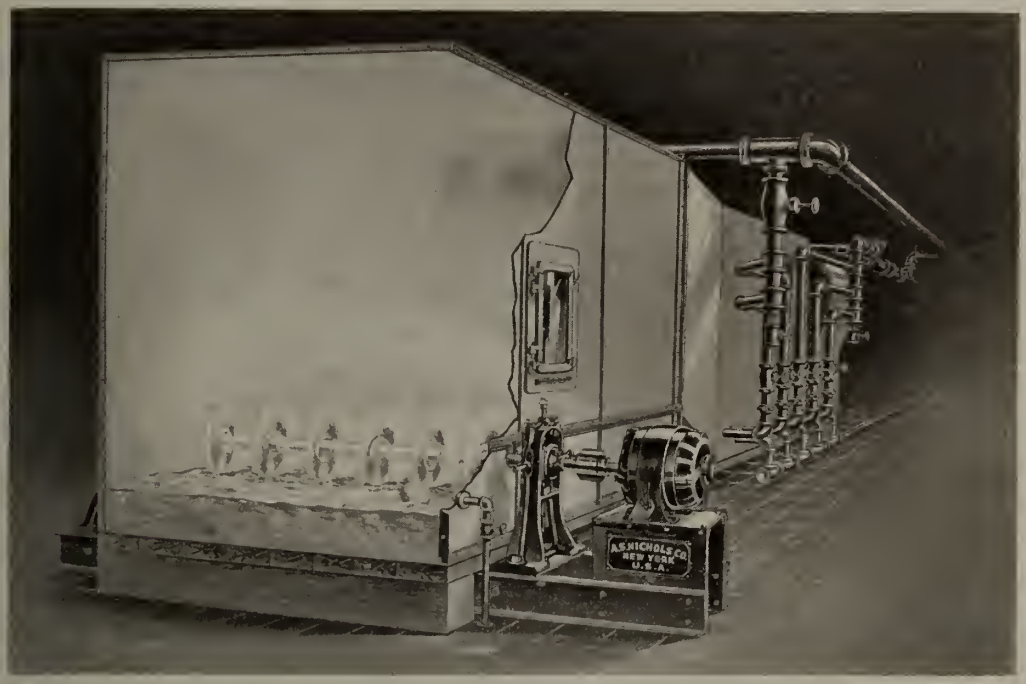
The Nichols' Varnish and Paint Dryer

A complete unit of fan, motor, heaters, air compressor, with automatic humidity and temperature controls.

A new rotary humidifying air washer, which eliminates all dust and dirt, does away with all spray heads, pump and connecting piping.

Manufactured in sizes suitable for all requirements.



DO YOU KNOW:

That the finest pianos, talking machine cabinets, furniture, and automobiles are finished by this method?

That the finish can be dried cleaner, faster and better in this way than by any other method? That the work is more durable and stands up better?

That all varnish shrinkage takes place in the DRYING ROOM, coat by coat, during the drying period, and not days or months later in show room or home?

That on cold mornings the finishing room can be quickly warmed, increasing comfort of men, coating efficiency, and condition of varnish?

That the finishing room can be properly ventilated and the health, working conditions and comfort of the workmen much improved?

That these results are obtained the year round, in Summer and Winter(irrespective of outside weather conditions?

That the investment pays for itself in one year or less?

These are FACTS and guaranteed by the A. S. Nichols Company, Sole Agents for all territory East of the Ohio, Mississippi and Detroit Rivers, in the United States and Canada. We are prepared to answer questions and quote prices on any drying problem. Communications covering varnish drying propositions west of the above mentioned territory, should be addressed to the Drying Systems Incorporated, Chicago, Ill.

We also continue to manufacture the Nichols' lumber and veneer dryers that we have been making for over thirty years.

Veneers and Panels

Plywood for Wall and Panel Work

Building Field Unlimited Market for Plywood Panels — Business Must be Developed— Method of Application Important Item

By S. H. Johnstone

The wide-awake woodworker, one who is always watching for new opportunities and new lines, will keep his eye on the panel and wall board field. The manufacturers of composition and pulp wall boards have worked up or created a wide market for their products, and there does not seem to be any real reasons why the manufacturers of veneered panels cannot "take a leaf from their book" and go after the same business. Built-up, wood-faced panels, whether with wood or composition core appear to have many points of superiority in their favor as compared with the pulp or composition product, so that the former article—veneered panels—should be able to secure a large volume of the wall board trade as well as develop new fields or markets which will eventually absorb large quantities of this material.

The veneered wall board would be far more attractive, would take a better finish—one that would improve with age. The cost of finishing, if in natural shades, would be less, they would be permanent, damp proof, slow burning and would stand up under service. As to price, they would cost little, if any, more than the common types of wall board, especially when finished, and who wouldn't be willing to pay a trifle more for a wood panel. If these points of superiority were to be placed logically and clearly before builders, contractors and home owners, both present and prospective, it should not take long to create a demand for wood panels. The individual woodworker can do a lot of missionary work and at the same time secure some what should be very profitable business. With each sale of wood panels for wall or partition purposes, an order would be secured for mouldings, batons or, perhaps, rails, stiles and mullions or, in other words, completed panel work.

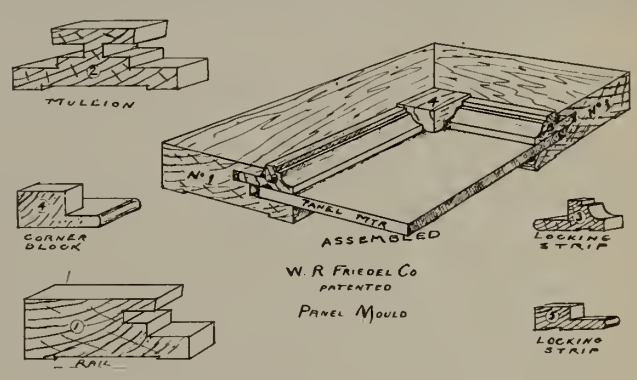
Method of Application Important

Some thought should be given to the method of attaching and using these panels, and to the details and construction of panelled partitions and wall panelling. If some form of construction could be developed that would simplify the work entailed in attaching wood panels and panelling, it would be a step in the right direction.

The accompanying sketches show a type of panel mould designed and patented by W. R. Friedel. In describing his system or method Mr. Friedel says the moulding compensates for all expansion and contraction which might occur in the panel proper, as well as providing a combined frame material and moulding that permits of a practical and attractive installation of the panel material.

The corner block No. 4 is used primarily with the locking strip No. 3. The use of this block permits the moulding or locking strip to be cut square and butted against the block, doing away with the mitred joint which would otherwise have to be made. The plainer locking strip No. 5 can be used with the block or a square joint made without the corner block, if desired.

The panel material is secured by the locking strip, with a friction contact only. The panels are cut to an approximate size and laid on the flange of the rail or mullion and not nailed. The width and thickness of the No. 1 and No. 2 may be varied to suit the work in hand. That being the case, a variation of No. 1 is adaptable to such material as door and window casings, base-boards, wainscot cap and similar lines. The contour of the outer edge of No. 3 may be varied and the face of No. 1 moulded if required. The design



Details of Friedel panel mouldings and corner blocks.

could also be varied for use in office partitions or elsewhere, where a single panel is used and both sides of the work is exposed to view.

Ideal for Window Decorations

In window displays the moulding readily allows for installing and removing the panel. Thus the panel could be taken out for refinishing or decorating. Some such construction for the panel work in windows would permit of frequent changes of background, as a number of sets of panels could be used and these painted or decorated to suit the displays about to be made.

Mr. Friedel suggests that the use of his moulding should tend to increase the sale of plywood for building and decorative purposes as it provides for a practical and easy installation, giving results that are attractive and at the same time probably cheaper than could be secured by any other means. The field is a promising one but it awaits development. This must be undertaken by those interested both individually and collectively.

Now that mahogany and other hardwoods are so dear it pays to build up newels and similar sized articles with a core of soft and commoner wood. To make a good job requires first-class workmanship.

Core and Crossbanding Construction

One Species of Wood in Core—Results in Faulty Work—Why Glue is Forced Through Face Stock

By Rich. Newbecker

The fact that the core body and crossbanding of a veneered panel is its very foundation and that the future success of the veneered product depends very much upon the factor of proper core and crossbanding, in fact just as much as on the proper application of the glue and face veneers, is seldom given the consideration that it deserves. In many plants, and this in some of the largest ones which turn out quantities of veneered stock, the idea is common that the cores represent just so much material which will eventually be covered up with the face veneers, and thus all defects or poor workmanship will be hidden.

Of course it is only natural that plants using considerable quantities of ⅛ in. veneers for faces, such as for door work, and three-ply panel construction,

Using different woods in core makes uneven surface.

will accumulate quantities of veneers, not fit for facing that may be worked up for center cores. This is a very good practice, saving as it does the purchase of stock for this purpose, that is, providing it is done in the proper manner.

Keep Woods Separate

In this connection I will cite an instance which occurred some time ago in a plant making a specialty of turning out veneered doors and panels. Their veneer requirements were purchased, both in dimension sizes and log run. The intention being to use the veneer not fit for face work, in the center stock for their three-ply panels. Now if oak veneers, or any other kind of one species had been used exclusively, all might have gone right, but as these doors and panels were made of some ten different native woods, and that all defective veneers were placed together in a scrap pile and then cut up into the desired dimensions for center stock, it made a difference as far as proper panel construction was concerned.

In cutting up the center stock, no attention whatever was paid to keeping the different species of wood by itself, with the result that often three or four different kinds of wood were used for center stock in the same panel. The stock all being ⅛ in. rotary cut veneer, no trouble whatever was anticipated from its use. After several hundred doors had been completed and about ready to be shipped, someone discovered a somewhat wavy or uneven appearance in the same, and as this varied in some doors from one wave or indention to three or four in others, while a small number were entirely free of this defect, "the powers that be" were at a loss to place the blame for these results.

What Examination Showed

After due consideration it was decided to take the panels out of one door and pull them apart to ascertain the reason for this uneven appearance of the panels. A door was selected which had two depressions in the panel, and same was examined. It was found that the center stock of the panel had been constructed, as shown in the accompanying illustration, with oak, gum and ash, all used together in the same core.

These panels had all received the proper treatment of drying and sanding, and this defect had not become apparent until later. In calipering up the thickness of the ⅛ cut oak veneer, it was found to be cut slightly heavier than the gum. The gum veneer being more absorbent to moisture, had taken in more glue moisture than the oak pieces, which resulted in a larger swelling. When panels were sanded, they were cut smooth. Finally after panels were placed in door and had plenty of time to dry out, the gum pieces of center stock shrank back to their original thickness, and as panels had been sanded, it made the face veneer that much thinner in these spots, with the result that depressions could be observed across the panels at certain intervals, which spoiled the beauty and appearance of the entire door, especially after the same had been hung and varnished.

Apply Glue to Core

In building up panels of three-ply construction, different methods are followed. In some plants the glue is applied to the veneers, while others apply it to the center stock. It is true applying it to the center stock may swell the same before pressure is applied, resulting in overlapping of joints if the material is not taped. Nevertheless to the writer's mind this is the best way after all, especially if proper care is exercised in the glueing operation. In many plants tape is used to hold the separate pieces together so as to make one unit. This practice is only advisable when the tape is placed across the ends where it will be ripped off in trimming to size. Tape should never be left under the face veneer, no matter how good it seems to stick to stock, for sooner or later the paper may separate, resulting in the panel blistering.

Another method of laying center stock is by the use of tacks in place of tape. A small upholstering tack, similar to the carpet tack, is used, only it is about one-half the size of the carpet tack, being about 3/16 inches long. In glueing up panels in which ⅛ inch thick or ¼ inch thick center or core stock is used, these can be used with safety for holding the center stock in position to prevent slipping or overlapping. In using tacks on the center stock, be sure and use them near the edges of each joint. In this way the swelling will be forced away from the tack and prevent the crowding or buckling of the joints before the same gets under pressure.

Why Glue Comes Through

In using the thinner and finer grades of veneer, for face work, such as 1/20 or thinner, mahogany or walnut, trouble is often experienced with the glue coming through and spoiling much of the fine figure in the same. Some veneer men mount these veneers on paper to prevent this trouble. This, however, is not to be recommended on account of the liability of blistering. You may, have wondered why the glue penetrates through some faces and not through others. Well, the secret of this is not in the glue nor

in the face veneers. Much of this trouble can be obviated if proper attention be paid to the core and crossbanding. If you use crossbanding that is of harder or denser structure than the face veneers you are bound to have trobule with the glue coming through the veneers. The face veneer being of softer texture wood, will be more receptive to the glue moisture than the harder crossbanding, and will, consequently, absorb more and become filled up. resulting in the faces becoming glue-soaked and glue coming through.

The remedy is obvious. Make a practice of only using crossbanding of a more absorbent or softer textured wood than the veneers you are about to use. For instance with such a combination as basswood crossbanding with mahogany veneers, in place of maple crossbanding with the same veneers, much of the trouble from glue coming through the face veneers will be obviated. Attention paid to these minor details will often increase the quality of your veneered product to a greater extent than what you may think as impossible of accomplishment.

Glue Joint as Viewed Through a Microscope

Does Joint Hold Through Chemical or Mechanical Action?—Magnifying Shows Adhesive in Pores of Wood—Surfaces Appear Rough and Uneven

When glue is properly applied it holds two sheets of wood together with strength that is surprising. When good glue is used, the two sheets of veneer, or pieces of wood, can scarcely be pulled apart without tearing or breaking the wood, says a writer in "Hardwood Record." That means that the wood may not be as strong as the glue joints that unites them.

By what means does the glue secure and maintain such a grip on the wood in contact with it? Some persons suppose that a sort of chemical action takes place by which the glue and the wood are bound together somewhere as two pieces of metal are welded together by hammering while hot. Possibly something like that takes place, but it evidently is not the main binding force that fastens the wood to the glue. They are held together largely, if not wholly, by mechanical means, comparable to the nails that hold boards together, if the nails are driven through both. An examination of a glue joint under a microscope sustains the correctness of this view.

The experiment is easy to make and it reveals some interesting things. It shows quite clearly how two wood surfaces are held together by glue. A microscope of only moderate power is needed, and some experimenting may be done with the naked eye alone. The unaided eye may suffice when two coarse, rough, and very porous woods are glued together, for then the penetration of the glue into the inequalities, pores, holes, and other cavities may be observed without any magnifying.

What the Lens Reveals

The wood surface to which glue is to be applied is not an absolutely smooth one, though it may look smooth to the naked eye, or it may feel perfectly smooth to the touch, if it has been planed or sandpapered. But when it has been magnified, it is discovered to be far from perfectly smooth. Such a surface under a glass of moderate power, looks like a plowed field, with its furrows and clods.

It is well known that wood is composed of pores, cells, and groups or bundles of fibers, some hollow, some jointed, and when the surface of wood is smoothed in a planer or by a sanding belt, these microscopic elements are torn, broken, split, and some of the minute cavities are laid open, so that the surface is quite rough, although the unaided eye may not detect the roughness, and the nerves of the finger tips may not be sufficiently sensitive to feel it. However, the roughness is there, and when liquid glue is spread over such a surface and pressure is applied, the plastic substance is forced into all the holes, pits and other openings. That takes place whether the glue is applied to a cross-section of wood, as the end of a board; to the tangential section, as the side of a board, or to the radial section, as a quarter-sawed piece. These three surfaces of wood present different appearances; but all are rough when seen in magnification, all have cavities, furrows, pits, and openings, and when fluid glue is spread on any one of these surfaces, and is subjected to pressure, it is forced into all the minute openings, and there it solidifies and hardens. Every projection of the solidified glue into the openings of such a surface is like a nail, a spike, or a dovetail, with a firm hold on the wood with which it is in direct contact.

If such a joint is pried apart, it is evident that the force must be sufficient to break the little spikes of hard glue that had penetrated the openings in the wood, or the wood must be broken or split, so that slivers of it can come away, still fast to the glue.

Either result may follow an attempt to force a glue joint apart. If the glue is weak, it will break when the strain comes, and the wood surface will remain intact; but if the glue is good, it may prove stronger than the wood to which it adheres, and when the joint is pried apart, the glue will bring slivers of wood away with it.

A Magnified Glue Joint

A glue joint is easily examined under the microscope. With a sharp knife, whittle very thin shavings from the edge of a panel, so that the shavings will show the wood on both sides of the glue, and the glue between. Place a bit of this shaving under the lens in a way to exposes the edges of both sheets of wood, and the glue in contact with them. Turn on a strong light, that shines through the object, and observe what the glue joint looks like.

One of the first things noted will probably be that the two sheets of wood do not seem to be actually in contact, but are separated by a very thin sheet or membrane of glue. The next thing noted, and it will certainly attract attention, will be the rough and notched edges of the sheets of wood. Instead of presenting the appearance of straight, even lines, they will be found more like jagged rows of bent and battered saw-teeth with broken gaps here and there. These are sections of the original surfaces of the veneer sheets, for the object now being viewed is a cross-section of a panel. One look at the notched lines will make it plain that the surface of a veneer sheet lacks a lot of being perfectly smooth.

The next thing to observe, and it should prove interesting, is the glue between the two strips of wood.

To obtain the best view, a panel of some white wood should be chosen for the microscopic study, like cottonwood, basswood, or white pine; for then the contrast in color will be sharp between the wood and the glue and the interlocking of the two will be easily seen. It will be easy to note how the liquid glue penetrated the minute openings in the wood, like pegs, nails, or dove-tails, and there solidified.

Prying Joints Open

The examination may be profitably carried farther; for the microscope enables one to observe and study what takes place when a glue joint between two sheets of veneer is pried apart. Several objects must be prepared to show different stages in the process of forcing the joint open.

The peglike projections of hard glue that are held tightly in the minute openings in the wood, cannot be pulled out as the joint is forced open. They must either break off, or they will pull slivers of the wood away with them. Sometimes one thing happens, sometimes the other. As to which will happen, depends on the strength of the glue and on the kind of wood, or, perhaps, it may depend on the efficiency of the workmanship when the joint was made. It is well known that some glues are stronger than some woods, and when a joint made with materials of that kind is forced open, the glue holds, and the wood tears and breaks. But with a strong wood, like maple and birch, and with a poor glue, it is the glue that breaks, rather than the wood.

Like a Dowel or Dovetail Joint

Builders of stone bridge piers sometimes fasten blocks of stone together by dovetailing. They cut dovetails in the faces of both stones that are to be joined. The blocks are then placed in position, face to face, each dovetail opposite its mate. They are then poured full of melted lead, and when it hardens, the two blocks of stone are held firmly together, each pair of dovetails constituting a bond that must break before the stones can be pried apart.

This furnishes an apt comparison with the fastening together of two wood surfaces with glue, the natural openings in the wood answering to the dovetails cut in the stones, and the glue serving the same purpose as the lead.

Those who have experimented with wood and glue work have doubtless become thoroughly acquainted with the methods by which glue adheres to the wood; but it appears that little has been published on the subject; for users frequently puzzle over the question of just how and why glue gets a grip on wood and why and how it holds so tenaciously. The microscope shows much, but it may not show all. Possibly some chemical action occurs which increases glue's power to hold. Be that as it may, the physical bond—acting like a nail or a dovetail—is sufficient to account for most of the force by which a glue joint resists a tendency to pull the pieces apart.

Something to Be Learned Yet

Generally, glue is credited with a good joint and blamed for a bad one, and perhaps in the majority of cases, that conclusion is justified; but there must be much difference between the holding powers of different woods as well as between different glues. Suppose, for instance, that the same quality of glue is used in all cases, and is applied in exactly the same way; might not the joints behave differently, if made of different woods? If maple and chestnut were glued together, and the joint then submitted to strain until failure resulted, it might be expected that one of the woods would give way before the other. Chestnut is very coarse, and its surface is covered with large openings, while maple is fine grained, and all its pores and openings are very small. The microscope reveals a very rough surface for chestnut, a comparatively smooth one for maple. If a sheet of maple is glued to a sheet of chestnut, it might be expected that the glue would anchor much more firmly to one than to the other.

The cavities in maple are much smaller than those in chestnut, as the microscope reveals them; but those of maple may make good in number what they lack in size, and for that reason, glue may hold as well as with chestnut, or even better. In a test of strength between maple and chestnut, there can be little doubt that maple would win. Therefore, in prying apart a veneer joint, between maple and chestnut, it would be expected that more slivers of chestnut than of maple would come away.

If there is chemical union or adhesion between glue and wood, that might account for the surprising strength shown by some glue joints; but if there is no such chemical union, acting as a weld acts between metals, it is reasonable to estimate the strength of a joint on the actual amount of glue and wood to be broken when the joint is forced open, influenced, of course, by relative strength of glues and the relative strength of woods. In either case, the comparative smoothness of the wood surfaces must have much to do with it, and the microscope reveals the fact that some woods can be reduced to surfaces much smoother than others, though the smoothest lacks much of being absolutely smooth.

Plywood Manufacturers Meet

The second annual convention of the Plywood Manufacturers' Association was held in Chicago on April 12th and 13th. A gratifying number of members were in attendance. The commissioner, M. Wulpi, in his report, covered the activities of the association for 1920, and exhibited a trade barometer report for the past year which made a very interesting study, giving, as it did, a concise view of the actual conditions which prevailed during the past season.

At the present moment conditions in the plywood industry show a slight upward trend. Some of the questions, which are under consideration, include traffic classification and rates, traffic matters, national publicity, standard grade rules, the standardization of glue and the preparation of a cost instruction book.

G. O. Worland, chairman of the publicity committee, made an extensive report of the progress made in organizing the National Publicity Campaign which is to be undertaken.

The following officials were elected for the ensuing year: President, T. D. Perry, Grand Rapids; first vice-president, C. B. Allen, Memphis; second vice-president, F. B. Ward, Bay City, Mich.; third vice-president, L. H. Sergent, Marshfield, Wis.; treasurer, E. W. Benjamin, Cadillac, Mich. The above officials, together with E. V. Knight, of New Albany, Ind., and O. G. Stainer, St. Louis, Mo., constitute the executive committee.

The next meeting of the association is to be held in Chicago some time during June.

·VERSATILITY·

The Keynote to Operating Efficiency

Versatility of manufacturing requires a complete assortment of manufacturing facilities and a supply of varied raw materials, all of high character. Our long successful record has been developed on a plan which aimed at an organization which could fill any and all requirements for high grade hardwood materials. That versatile organization maintains contact with a tremendous supply of splendid timber and incorporates four band mills and three veneer mills, each designed for the manufacture of a specific product. The result is the best obtainable in quartered and plain white oak lumber, sawed quartered oak veneers, walnut lumber and sliced and rotary cut walnut veneers, rotary cut yellow poplar crossbanding and a general line of high grade hardwoods—an offering and a service that warrants your inquiries.

ALGOMA *the Better* Plywood

"For want of a nail . . . . the horse was lost"

Many a retail sale falls through because the graining and the finish of the top or panels do not appeal to the customer's taste. Many a customer has become dissatisfied because the plywood used in his purchase did not stand up under use. He does not blame the maker of the plywood, he blames your dealer and you.

Therefore, it is important to check up on your panels and plywood. Be sure that the manufacturer who supplies you works by such standards as those which produced Algoma, the better Plywood. For thirty-five years we have been building plywood that does have the surface and graining which give greater quality to the finished product.

To give Algoma Plywood its permanence of form, throughout our factory care is used in every process. Test one order of Algoma, the Better Plywood, by actual use, and you'll standardize on this plywood for every job.

. . .

Did you ever consider how much depends on your choice of Plywood?

ALGOMA PANEL COMPANY, *Algoma, Wis.*

Getting Results With Scrolls and Curves

Veneering of Curved Surfaces Presents Problems—Suggestions for Simplifying Work—Band Sawyer Plays Important Part

One of the most difficult operations the veneer man has to do is veneering irregular shapes. Some of these are of such a shape that it is almost impossible to be sure of a first-class job. Many designers are very considerate of this difficulty and give it special attention, while others, a small minority I am glad to say, seem to have the idea that anything that can be drawn with a pencil can be veneered. Of course, such men have never had any practical experience and have no business attempting to design furniture. The trouble with such men is they do not want to learn, for if one suggests a change in shape, or even in the specification, in order to eliminate some difficulty, or reduce the cost of construction, they always have a lot of theories to advance as to why, in their opinion, it cannot be done in the way suggested.

The most difficult thing the veener man has to accomplish is that of an even pressure at all points. The same high pressure that is required on flat work is not necessary to success in veneering these irregular shapes, but it is exceedingly important that there be a reasonable pressure at all points, and in making these designs and preparing specifications the designer should give first consideration to the practical side of production and the expense involved. If the veneer man cannot get pressure sufficient to make a permanent job because of faulty design or specification, the whole thing is a failure, no matter how it may look on paper.

Securing Uniform Pressure

A great deal of this irregular work is band sawed, and unless the band sawyer is one who thoroughly understands his business, his work may give the veneer man trouble. It frequently happens that in veneering scrolls the part that is cut away at the band saw to make the scroll is used as a caul, or form, to press the veneer into shape. This is the best way to make the veneer conform to the shape, but if the band sawyer will first ascertain the thickness of the veneer to be used, and use a saw that will make a cut the same thickness as the veneer, so that the veneer will simply fill in the space cut out by the saw, he will eliminate much of the difficulty which one would otherwise have in getting uniform pressure. To illustrate why this is so, take and saw a scroll and lay the two pieces together, and you will see that they touch at some points, while at other points they are open, or separated. Now, if the wood that had been cut away could be gathered up and placed in its old position, it would bring all these points an equal distance apart again, the same as they were before the cut was taken away. We cannot get that same wood back again, but a piece of veneer the same thickness should answer the same purpose. Now, if the saw kerf is 1/16 in. wide and we fill that space with a 1/16 in. veneer, we have practically the same condition as obtained before the scroll was cut, and if we put it in the press we will have uniform pressure as all points touch alike. But should the veneer be thinner or thicker than the saw with which the scroll was cut, some points will touch and others will not, with the result that some points will receive little or no pressure, while others will receive more than they require.

In making sharp curves with a band saw it is necessary to use a narrow blade in order to confine the width of the kerf to the thickness of the veneer to be used. In doing work of this kind one should have his machine in the best possible condition, to keep his saw from going astray, for the slightest wandering at this time will make it pretty hard for the veneer man to do his work in a satisfactory way.

The veneer man must also know his business for, no matter how well the work of designing and cutting scrolls may be done, if the veneer man does not understand the principles of applying pressure on work of this kind, he will not get it uniform. It is seldom that on work of this kind the pressure can be applied to one point at a time, and it should be applied gradually. It is possible to so apply the pressure to one part of a scroll that little or no pressure can be obtained at another point. Watch the pressure closely and apply it a little at a time at each point—not all at one point first, and then try to get it all on at another point. I have seen work crushed beyond recovery in an effort to obtain pressure at a point that could easily have been reached had the pressure been relaxed at another point; then all could have been tightened up together. Pressure frequently has to be applied from different directions, and one must study his scroll to learn where to start the pressure. As we said before, it does not take a great deal of pressure to do good work on small surfaces like scrolls,

VENEERS

The Quality Kind

We carry in stock, for immediate shipment, 3 and 5 ply Panels in Birch, Oak, and Mahogany — sizes 24" and 30" wide, 48", 60" and 72" long.

A complete range of American Walnut, Quartered Oak, Mahogany, Figured Gum Veneers and Rotary Cut Veneers.

It is not uncommon that a really fine piece of furniture has been practically ruined after a few months service because of the poor grade of veneer used. Such happenings do much to harm the manufacturer's reputation. That is why many will not consider anything but the best—usually they insist on Toronto Veneers—the quality kind.

Filling for Open Joints

Windsor, N.S., April 27, 1921.

Editor, Canadian Woodworker:

Tops of bureaus, commodes, buffets, etc., made of birch, beech and similar woods and jointed on a Linderman machine, show a strong tendency to open up, a few days after being glued. This often happens when the articles are being finished or even when completed and awaiting shipment. I would like to know if you can suggest any preparation or filler that could be applied to the open joints and which would make a permanent job. Thanking you for a prompt reply.

Sincerely yours,
R. D. Green.

There are a number of preparations which might be used to fill the cracks appearing in the ends of your bureau and dresser tops but this trouble is one which is very hard to remedy.

These cracks appear because the stock used in the tops is not thoroughly dry. Naturally the ends would dry quicker than the body of the top and as a result shrink faster. Something is bound to open up, and as a rule it is the joints which give way. The real remedy is to see that the stock is thoroughly dry when glued up and that in subsequent operations it is not given an opportunity to absorb moisture.

Many firms, when they find the tops of stock opening up, remove the tops, dry the stock and make new joints, then re-finish again. If these cracks are not very wide, it is possible that you might be able to fill them with stick shellac. This material can be secured from manufacturers of finishing material and comes in different shades to match all finishes. By securing a shade that would blend in with the surface oak finish, you might be able to melt this shellac into the crack and thus overcome the trouble. One drawback is that if the top has not dried out before these cracks are filled, they will likely open a little more and you will find it necessary to do the work over again.

The Perkins Glue Co. of Lansdale, Penn., manufacture a material which they call "Quick Repair." This is for filling splits, checks and other defects in face veneers. It is made in different colors to suit all finishes. We are under the impression that this must be used before the stock is finishd, but would suggest that you put your problem up to them to see what they have to say.

Kapok Wanted

Hamilton, April 19, 1921.

Editor, Canadian Woodworker:

Can you tell me where I can buy some Kapok for filling mattresses and cushions.

Yours truly,
John Leverington.

Kapok may be secured, either by the bale or in larger quantities, from any of the following firms: Gold Medal Furniture Mfg. Co., Toronto; Whitworth & Restall, Toronto, or the Canadian Feather & Mattress Co., Toronto.

Enquiry for Yard Sticks

Montreal, May 7, 1921

Editor, Canadian Woodworker.

We have received an enquiry for a large quantity of maple yard sticks for advertising purposes. These yard sticks must be made of maple wood, have a certain amount of printing or stamping matter on both sides of them, and our clients essentially stipulate that these yard sticks must be made in Canada. Can you give us the name of any firm in Canada which is equipped to handle this business.

Yours truly,
Alexander, Furniss & Co.

We do not know of any company in Canada making yard sticks. H. E. Hunt, Toronto, has installed machinery for making 12 in. and 15 in. rulers and may be able to handle yard sticks. If there is any difficulty in having the stamping or printing done, could not transfers be used instead?

Rush for Chair Seats

Victoria, B.C., April 22, 1921.

Editor, Canadian Woodworker:

Do you happen to know where I could procure, in Canada, rush seats for chairs? Or, in the event of not being able to get them made up, where could I get the rushes suitable for this purpose? Thanking you in anticipation, I am,

Yours truly,
H. L. Johnson.

If any of our readers can supply this information we will be glad to forward it. Here is a chance for a little real co-operation.

Chairs Wanted

One of the largest firms of commission agents in Trinidad, with branch offices in Demerara and Barbados, would like to represent a Canadian firm manufacturing a cheap grade of upright chairs, both with wooden and cane seats, and also rocking chairs. If prices are right, a large business can be guaranteed. Inquiry No. 2920.

Early English Finish

Southampton, Ont., May 6, 1921.

Editor, Canadian Woodworker:

Replying to the enquiry in the April issue of your paper, I will outline how I secure the early English finish. Cut 1 lb. of No. 555 Lockwood Early English powder with one pint of benzoil, then add enough benzine to make 2 gallons of stain. Brush on the wood evenly and then after it is dry, say 12 hours, give a coat of white shellac, cut 1 lb. to a gallon of spirits. After the shellac has dried fill with a black filler, when shellac again, then varnish and rub with oil and pumice after varnish has stood for four days. Regular golden oak filler with "drop black" added makes a good filler.

Sincerely yours,
C. H. Green.

It is wonderful how long some British-made sawing and moulding machines will run without requiring any repairs.

Is Opportune Time to Buy Lumber Passing?

Reports Indicate Prices Stiffening—Better Grades Exceedingly Scarce—Production Further Curtailed—Shortage in Certain Lines Probable

Judging from reports received from the various lumber manufacturing centres, especially those producing oak and gum, it would appear as if there has been a decided change in the lumber situation during the past few weeks. This change cannot be attributed to any unexpected improvement in demand, although buying is on the increase, but more to a combination of causes.

Many operators and buyers are convinced that the lowest point has been reached and that conditions in the lumber industry are due to improve. This conviction is borne out by the fact that the demand for stock is slowly but none the less surely increasing. It is not anticipated that things will come back with a rush, were they to, prices would shoot upward, but rather that there will be a slow, steady movement toward stabilization and good, sound business.

Shortage of Upper Stock

There are a number of other influencing factors. One is that there is an undoubted shortage of upper grade lumber, and this condition will become more marked as buying continues. F. A. S. and No. 1 and 2 commons are becoming increasingly scarce and hard to secure. This condition is, as would be expected, being reflected in prices, which have advanced on many items in these grades. It will not be long before this shortage of high-grade material will affect the grades immediately below. When a buyer cannot secure the stock he wants, or is accustomed to buying, he takes the next best grade. For this reason it is thought likely that the shortage of upper grades, with its tendency toward higher values, will gradually be noticeable in connection with all lower stock.

Now a word about production. It is a well-known fact that many mills are closed and that production is at a very low point. This condition is being further aggravated because many of those that have continued cutting are closing or planning to close. Many of these mills remained in operation with the sole object of cutting the accumulation of logs they had in their yards and in the woods. As these logs are worked up, the mills are closing down.

Production Will Continue Low

It will be some time before these mills can resume cutting even though the market should show a rapid improvement. First it would be necessary to start the woods operations and assure a steady supply of logs. This cannot be done in a day or a week. The resumption of logging operations is out of the question at the present time owing to a prolonged spell of wet weather which has made conditions in many of the logging areas such that it would be next to impossible to put a crew in and commence bringing out logs inside of six weeks or two months. Thus it will be seen that there is little to be expected from the production end. As far as the Southern producing centres are concerned, it is predicted that all the stock which will be cut this year, will be on the sticks by the end of June.

The few mills that are operating can offer but little hope of relief, that is as far as the better-grade material is concerned. The logs on which they have been working for the past few months and those which remain to be sawn, were cut last season and have been lying in the woods, along roads, at railway sidings and stored in the mill yards, for long periods, with the result that they have deteriorated to such an extent that they contain little, if any, high-grade lumber, so that the material which is being manufactured to-day is principally low-grade stock. In view of this it is difficult to see how the depleted and broken stocks of uppers can be replenished before fall or even before the new year.

Apply in Other Fields

It is expected that similar conditions will gradually extend to other centres. In the northern field, cutting birch, beech, maple, etc., production is being curtailed still further. The manufacturers of these goods will not go on producing when they cannot secure cost from the material. There has not been any noticeable increase in demand in this section but it is felt that buying will shortly show an improvemennt. According to statistics covering the month of April, production in Michigan woods was one-third less than orders received.

In the Canadian hardwood centres stocks are none too plentiful, especially in the better grades, and production is low. Many of the small manufacturers, who in the past were responsible for the bulk of the cut in Ontario and Quebec, are finding it difficult to finance their operations this season. Formerly they were accustomed to lean on the bank but owing to general conditions, the banks are not as free with their credit as formerly. This can have but one result, namely, that production is bound to be considerably below normal. Other factors are not hard to find which have tended to have the same effect—lower production. As confidence returns and buying becomes easier, it can lead to but one condition, one that is not favorable for the buyer and user of lumber, and that is a shortage in many lines coupled with stiffening prices.

If this improvement in demand has already set in, and many claim that they see indications which show that the tide has turned, it would appear as if the most favorable time to sort up stock and cover for the next few months is rapidly passing. Lumber cannot go lower, the next movement is upward. Has that movement begun?

Good Price for Sawdust

One woodworker, who manufactures a product calling for a large quantity of thin hardwood strips, reports that he is able to dispose of the sawdust produced at a price that pays nearly 50% of the lumber bill. In this particular instance the sawdust is used by several fur-cleaning establishments and to secure the desired quality and grade this woodworker files his saws in a special manner and then sifts the sawdust. The price secured is in the neighborhood of $1.00 per bag. This only goes to show that a market can be found for sawdust, and shavings too, if one will but look for it.

News of the Trade

McCulloch Bros., Debert, N.S., contemplates erecting a woodworking plant at a cost of $10.000.

The plant of the Royal Bedding Co. of Toronto was damaged to the extent of $1,000 by fire recently.

The Eburne Sash & Door Co., Marpole, B.C., has been recently organized with C. R. Whitley and V. J. Winkel as partners.

M. A. Bradshaw, 1483 Chateaubriand St., Montreal, has commenced work on a new box factory, the building to be 50 x 42, 2 storeys high.

The plant of the Ontario Case & Store Fixture Co., Queen St., Toronto, was recently visited by fire. The damage amount to about $2,500.

The 24th annual convention of the National Hardwood Lumber Manufacturers' Association is to be held in Philadelphia June 9th and 10th.

Sturgis Baby Carriage Company Limited, Toronto, have been authorized by supplementary letters patent to increase their capital from $40,000 to the sum of $250,000.

The H. E. Furniture Company, Limited, Milverton, Ont., have been authorized by supplementary letters patent, to increase their capital from $40,000 to the sum of $150,000.

The Great West Mfg. Co., Limited, Vancouver, B.C., is producing a line of sectional houses for the prairie trade. These are made in sizes of 20 x 24, 22 x 24, 24 x 24. S. Brereton is the manager.

The Memorial Shops were recently opened on Water St., St. John, N. B. This is being promoted by a number of returned men who propose making furniture to order and doing light jobbing of all kinds.

The Riddell Carriage and Motor Works, Limited, Saskatoon, Sask., were recently granted a provincial charter to manufacture and deal in carriages, automobiles, and other wooden vehicles. Capital $100,000.

Lundy Products, Limtied, Toronto, was recently granted a provincial charter to manufacture and deal in all kinds of washing machines. Capital $40,000. A. R. Lundy and Beatty Douglas, both of Toronto, are two of the incorporators.

Plans are being prepared by the Conklin Planing Mill Co., Kingsville, Ont., for a new planing mill and office to cost approximately $25,000. W. T. Conklin, the proprietor, expects construction to be under way early this summer.

The third annual convention of the National Association of Wood Turners, Incorporated, and Affiliated Associations will be held at Hotel Washington, Washington, D.C., on Wednesday, Thursday and Friday, June 8th, 9th and 10th.

The Speaker's chair, which was illustrated in the April "Canadian Woodworker," was formerly presented to the House of Commons on Friday, May 20th. Former Speaker Lowther, of the British House of Commons, made the presentation.

The Glass Casket Company, Limited, Montreal, were recently incorporated to manufacture and deal in glass and other kinds of burial caskets. Capital $2,000,000. Among the incorporators are G. McTeigue and R. Brodeur, both of Montreal.

Dominion Bedstead Company, Limited, Montreal, has been incorporated to manufacture and deal in beds, furniture and upholstered products. Capital $250,000. H. Weinfield and M. M. Sperber, both of Montreal, are two of the incorporators.

Scythes Vocalion Co., Limited, Toronto, were recently incorporated to manufacture and deal in all kinds of musical instruments. Capital $200,000. W. Zimmerman and W. H. Osborne, barristers, both of Toronto, are two of the incorporators.

Mack Trucks of Canada, Limited, Toronto, have been incorporated to manufacture and deal in motor trucks, automobiles and other wooden vehicles. Capital $50,000. W. W. Perry and C. C. Legott, both of Toronto, are two of the incorporators.

The Community Builders, Limited, Toronto, were recently incorporated to carry on business as contractors and manufacturers of and dealers in building material; capital $500,000. H. D. Johnston and H. B. Taber, both of Toronto, are among the incorporators. These same gentlemen are among the provisional directors of another newly organized association known as the Toronto Home Builders' Association. This organization has been incorporated to promote all kinds of building and to protect those engaged in the construction industry.

Hoffman & Company, Limited, Montreal, were recently granted a provincial charter to manufacture and deal in cigar boxes and other wooden containers. Capital $50,000. Two of the incorporators are F. Hoffman and H. A. Bermigaud, manufacturers, both of Montreal.

Reports received from Vancouver indicate that heavy shipments of box shooks are being made on nearly every boat leaving that port for the Orient, Singapore and Australia. A considerable volume of business is also being secured from some of the Mediterranean states.

Waltham Motors Corporation, of Canada, Limited, Toronto, has been incorporated to manufacture and deal in automobiles, trucks, carriages and other vehicles. Capital $1,000,000. Among the incorporators are M. C. van der Voort and John Gallivan, both of Toronto.

Campagnie d'Importation du Canada, Limitec, Montreal, were recently granted a federal charter to manufacture and deal in furniture, toys, picture frames and wooden products. Capital $125,000. Two of the incorporators are J. B. Fortin and R. A. Perrault, both of Montreal.

Kasement Skrene Dore Company, Limited, Toronto, was recently granted a provincial charter to manufacture and deal in doors, sashes, screens and other wood products. Capital $50,000. W. H. Cunningham and W. F. Hill, both of Toronto, are two of the incorporators.

Waterloo Bedding Company, Limited, Waterloo, Ont., were recently incorporated to manufacture and deal in beds, bedding equipment and upholstered products. Capital $200,000. M. H. Montag and A. L. Dantzer, manufacturers, of Waterloo, are two of the incorporators.

The Acadian Phonograph Company, Limited, Toronto, was recently granted a provincial charter to manufacture and deal in phonographs, gramophones and other musical instruments. Capital $40,000. J. H. Young and L. J. Brown, both of Toronto, are two of the incorporators.

The Cooperage Company of Canada, Limited, Toronto, were recently granted a provincial charter to manufacture and deal in barrels, kegs and other wooden containers. Capital $40,000. Two of the incorporators are M. L. Gordon and I. M. Macdonell, barristers, both of Toronto.

Mayers Chalmers, Limited, Sault Ste. Marie, Ont., were recently incorporated to manufacture and deal in automobiles, trucks, boats, flying machines and other wooden products. Capital $75,000. W. H. Ewing and W. C. Mayer, both of Sault Ste. Marie, Ont., are two of the incorporators.

The T. H. Brown Company, Limited, Toronto, have been incorporated to manufacture and deal in all kinds of musical instruments and to take over the business known as T. H. Brown & Co. Capital $40,000. T. H. Brown and C. S. Ballard, both of Toronto, are two of the incorporators.

Dominion Broom & Handle Co., Limited, Mount Dennis, Ont., has been granted a provincial charter to manufacture and deal in brooms, brushes, handles and other wooden products. Capital $40,000. Two of the incorporators are H. J. Martin and C. Evans-Lewis, barristers, both of Toronto.

The McLagan Furniture Co., Limited, Stratford, Ont., recently put into effect a 10% reduction in wages and salaries. This effects the whole staff from the management down. The hours have been increased to 50 per week so that weekly pay envelopes of the workmen will be the same as formerly.

Acoustiques Phonographiques, Limited, Montreal, have ben incorporated to take over the business known as Benoit & Mathieu and to manufacture and deal in pianos, phonographs and other musical instruments. Capital $50,000. Two of the incorporators are J. L. Mathieu and A. Benoit, both of Montreal.

W. H. Cunningham & Hill, Limited, Toronto, Ont., were recently incorporated with a capital of $150,000. This new firm takes over the business now being carried on by W. H. Cunningham & Co. This firm is the Canadian representative for the Monite Waterproof Glue Co. of Chicago, manufacturers of Monite Casein Glue.

The enamelling department of the Canada Wood Specialty Co., Limited, Orillia, was recently seriously damaged by fire. The loss amounts to about $10,000. The fire is supposed to have started from the electric wiring in connection with the enamelling ovens. This was a very busy department of the plant and was handling about 40,000 pieces

Three Questions—

could you answer them?

Do you ever consult your banker—Most likely—Then suppose your banker, for instance, asked you these three questions—could you answer them? Try it!

1. *How many hours of labor do you purchase each month?*
2. *How many were productive hours?*
3. *Are the records of your purchased and productive hours printed and unchangeable.*

They may be, and probably are, pertinent questions, and on them may rest the success or failure of an organization—yours perhaps.

If you can answer these three questions by the simple reference to records that are printed and unchangeable, you have complete control over what is today the costliest item of production—labor.

International Time Recorders and International Job Time Recorders give you the answers to these vital questions any time you care to refer to them for any month, any week, any day in the year. And those records are convincing too, because they cannot be changed.

We have a time recording system that will give you accurate information on the labor costs of your factory. A short talk with one of our representatives or some of our literature may prove of great value to you. No obligation attached to either—just say which.

International Business Machines SPEED ACCURACY ECONOMY

International Business Machines Co.

LIMITED

F. E. MUTTON, Vice-President and General Manager

Head Office and Factory: 300-350 Campbell Avenue, Toronto

HALIFAX, 44 Granville St. ST. JOHN, 18 Germain St. QUEBEC, 506 Merger Bldg. MONTREAL, 1 and 3 Notre Dame St. OTTAWA, 190 Queen St. TORONTO, 409½ Yonge St. HAMILTON, Room 8, 36 James St. S. LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd WINNIPEG, 227 McDermott Ave. VANCOUVER, 110 Water St. SASKATOON, 254 Third Ave. S.

Also manufacturers of International Dayton Scales and International Electric Tabulators

per day. There was about two week's supply of unfinished material in the building at the time of the blaze. Repairs will be effected as quickly as possible and it is hoped that finishing operations will be resumed in quick order.

H. E. Hunt, who operates a woodworking plant at 337 Leslie St., Toronto, is producing a line of advertising and school rulers which are equal to the best imported product. Mr. Hunt designed the special equipment which has been installed to handle these rulers. He claims to be the only manufacturer of this line in Canada.

The Eternal Battery Co. of Canada, Limited, Winnipeg, Man., which was recently organized with a capitalization of $1,000,000, have secured suitable quarters in Winnipeg and are manufacturing their line of storage batteries for automobiles, motor boats, etc. About 20 hands are employed and the present output is 30 batteries per day.

The employees of the Office Specialty Co., Newmarket, Ont., together with their wives and families, were the guests of the management at a very enjoyable concert. The programme consisted of a number of attractive moving pictures interspread with some fine musical selections. A. M. Smith, superintendent of the factory, presided.

Canadian Wood Heel & Block, Limited, Pointe-Aux-Trembles, P.Q., was recently granted a provincial charter to manufacture and deal in wooden heels, patterns and moulds, sashes and doors and other wood products. Capital $90,000. T. Desnoyers, of Pointe-Aux-Trembles, and C. Durocher, of Montreal East, are two of the incorporators.

London Woodworkers, Limited, London, Ont., were recently incorporated to take over the business known as the London Art Woodwork Company, Limited, and to manufacture and deal in interior fittings and other wooden decoration. Capital $100,000. E. R. Dennis and T. J. Murphy, both of London, Ont., are two of the incorporators .

That the high freight rates have a lot to do with present lumber values was shown by a memorandum exhibited by a large lumber manufacturer recently, in which it was shown that freight to the extent of $947.03 was paid on lumber valued at $1,142.03, leaving a balance of $195.00 for the lumber manufacturer. This is at the rate of about 5 to 1.

The Ottawa Building Trades Council has abandoned its former policy and recently came out in favor of individual bargaining. This action on the part of labor practically eliminates the chance of a general strike. Agreements will now be made by the various unions that comprise the council with individual contractors or groups of all contractors.

C. W. Young and George E. Ronson have formed a partnership to conduct a general woodworking business manufacturing store, office and church fixtures, together with store fronts, show-cases and special furniture. Both these gentlemen have had considerable experience in the woodworking business and should be able to make a success of their new venture.

"The Rid-Jid of Canada" is the name of a new company organized in Ingersoll to manufacture the "Rid-Jid" ironing board. G. C. Ellis, for many years head of the Ellis Furniture Co., and H. Swallow, formerly of the Ingersoll File Co., are the organizers. In all probability this article will be manufactured in connection with the plant of the Ellis Furniture Co., Limited.

A successful, well-attended meeting of the Furniture Manufacturers' Association was held in Toronto on Wednesday, May 18th. This was the regular semi-annual gathering. A number of important questions were discussed, including the work of the newly organized Home Furnishings Bureau. A full report of this meeting will appear in the June "Canadian Woodworker."

The Everready Mfg. Co. of Canada, Limited, has secured a factory building in Hull, P.Q., and contemplate manufacturing a line of office appliances and furniture. The parent organization of this company is located in Boston, and owing to the duties and high exchange rate, it has been found advisable to establish this Canadian branch. It is expected that about 50 hands will be employed.

The Jackson Mfg. Co. have secured a plant at Durham, Ont., and are equipping it for the manufacture of phonograph cabinets. It is understood that a contract has been secured from the Columbia Phonograph Co. and that for the present the output will be confined to "Grafonola" Cabinets. About 20 hands will be employed at the start and it is anticipated that this number will be increased to at least 50.

The installation of the equipment in the new plant of Miller & Gordon Mfg. Co., Carleton, N.S., is rapidly nearing completion. This factory is to be devoted largely to the manufacture of hardwood products in the shape of clothespins and dowels. Up-to-date labor-saving production machinery has been purchased and when the plant is complete it will be one of the finest of its kind in operation.

The union carpenters of Vancouver have agreed to accept the new rate of $6.50 per day offered by the contractors. When this schedule was presented a mass meeting was held and when the vote was taken it was found that, while there were a few men desirous of making a fight for the old rate of $7.25 per day, the majority did not wish to go out at this time, and as a consequence were willing to accept the reduced wage.

According to a statement recently made by E. J. Ryan of the E. J. Ryan Contracting Co., Vancouver, B.C., present building costs are 30% lower than they were this time last year. He considers that with this reduction building prices have about reached the bottom as far as 1921 is concerned at least. In figuring this decrease, he considers that the cost of labor has dropped 15% with a corresponding drop in the price of building material.

Thos. Jackson, a 14-year old boy in the employ of the Keenan Woodenware Mfg. Co., Owen Sound, recently had the misfortune to lose his left hand and part of his arm. The young lad was employed as a helper in the factory and was wheeling a wheelbarrow full of shavings to a conveyor. Just as he was passing the saw, the load tipped and in endeavoring to right it, he lost his balance and to prevent himself falling, threw his arm forward, striking the saw.

Hart & McDonagh, wholesale lumber dealers, of Toronto, who have been in the lumber business for the past five years, recently dissolved partnership. R. F. McDonagh, the manager, has formed The McDonagh Lumber Co., with offices in the Confederation Life Bldg., Toronto. It is probable that G. P. Hart, the other partner, and secretary-treasurer of the company, will organize a new company to be known as "Hart, Hamilton & Jackson," with head offices in Toronto.

The plant of the Mill Cut Homes & Lumber Co., Limited, Vancouver, B.C., was completely destroyed by fire recently. The damage was placed at $30,000, and is partly covered by insurance. It is understood that a new factory will be erected as quickly as possible. This company was formerly known as the 20th Century House Co., but was reorganized about a year ago and the name changed to the "Mill Cut Homes & Lumber Co." J. L. Northey is the manager.

A very successful building show was held in Vancouver April 30th to May 7th. One of the outstanding features was a full-sized reproduction of a bungalow, which was given away to one of the visitors. The various manufacturers and exhibitors of building material donated the different material which went to make up this home. Considerable interest was evinced by the general public in this show and it should have the effect of stimulating interest in home building.

The employees of the McAuliffe-Davis Lumber Co., Ottawa, Ont., have voluntarily accepted a reduction of from 10%to 12% in wages. In making this announcement, Mr. Davis intimated that the employees realized that the majority of the proprietors of woodworking plants kept their establishments open last year at a loss in order to provide emp'oyment, and have agreed to accept reduction of from 10% to 12% from existing rates. It is understood that the men in other plants in Ottawa are following a similar course.

The Office Specialty Mfg. Co., Newmarket, Ont., are spending a considerable sum of money in fitting up an adjacent property for an athletic field. They propose constructing bowling greens, baseball diamond, tennis courts and clubhouse. An announcement to this effect was made recently at a meeting of the employees. An athletic association has been formed with the following officers:—H. C. Clemes, honorary-president; R. F. Smith, president; D. Doyle and G. Manning, vice-presidents; and G. D. Wart, secretary-treasurer.

The Cut-to-Fit Lumber Co., Limited, Vancouver, B.C., are reorganizing and have applied to the Provincial Government for an additional loan under the Industries Act. This firm received $50,000 from the Government some time ago, but are again in need of funds and have applied for another loan. It is probable that they may receive $25,000 from this source provided they can secure an equal amount elsewhere. A number of nice orders have been secured and the prospects for future operations are very good provided the increased capital is forthcoming.

United Growers Packages Limited is the name of the company recently organized by the fruit growers of the fruit

WHEN THE ABILITY TO SERVE COUNTS MOST

When things are spotty; when your factory is filled up for a couple of weeks and then is practically empty; when even though you know lumber is a good buy, you are afraid to stock up and instead place rush orders for just what you need—then is when a time-tried lumber organization with a steadfast record for service and dependability, is a real asset. Our many years experience; our diversified and modern manufacturing facilities and the varied assortment of southern hardwoods, rotary veneers and plywood, are as well adapted to give satisfaction in filling to-day's hurried needs as in supplying big contracts in more normal times.

Regardless of your position, this organization merits your investigation.

ANDERSON-TULLY CO.
MEMPHIS

growers of the Niagara district to manufacture baskets, berry boxes and fruit containers. A factory has been secured at Niagara-on-the-Lake and is being equipped with the necessary machines. The initial capacity is estimated at 1,000,000 baskets but this can be increased. T. B. Revett, reeve of Niagara-on-the-Lake, is secretary-treasurer of the company, with A. T. Baker, president; T. A. Griffiths, vice-president, and C. E. Secord and W. H. Hunter, directors.

The furniture workers of Stratford, Ont., have protested to the McLagan Furniture Co., Limited; Stratford Chair Co., Limited; Kindel Bed Co. and the Stratford Mfg. Co., against the proposal to reduce wages 10%. This protest took the form of a resolution as follows: "That we protest against reduction of wages, of which we have received notice, on the grounds that it is not warranted and because of the abnormally low wages which prevail in the furniture industry." It is understood that the hours of work have been lengthened so that the weekly wage will not be any lower under the new rate.

The Unity Mfg. Co., Toronto, is the name of a concern organized a short while ago to manufacture toys and furniture. They have taken over the building formerly occupied by the Victory Cabinet Co., and at the present time are making a line of library tables, chiffoniers, dining room furniture and wheeled toys. About 15 hands are being employed. The output is sold chiefly to the local trade. The equipment, which was purchased from the estate of Green Bros., consists of a number of saws, together with drum sander, band saw, lathe, shaper, swing cut-off, planer and buzz planer. C. Sawyer is controlling the affairs of this company.

At the annual meeting of the Box Manufacturers' Section of the British Columbia Branch of the Canadian Manufacturers' Association, the following officers were elected: Chairman, R. B. Sharpe, of the Pacific Box Co., Limited, Vancouver; vice-chairman, P. J. McMurphy, B. C. Manufacturing Co., New Westminster; chairman of local committees, A. N. Sharpe, of the British Columbia Box Co., Vancouver; chairman of the Export Committee, H. C. Airth of the Westminster Shook Mills, New Westminster. Reports on the activities of the Association for the past year were read and adopted and the policy for 1921-22 outlined.

An amendment to the Factories' Act was submitted in the House recently by the Hon. Walter Rollo, Minister of Labor, which will prevent the employment of minors under 16 years of age, who have not a certificate from the school attendant officer, permitting them to go to work. This amendment will bring the Factories Act into conformity with the Adolescents School Attendance Act, which goes into effect this fall. This latter act raises the compulsory school attendance age from 14 to 16 years and the amendment to the Factories Act will reflect this change. Under the existing law, minors under 14 may be employed if permission is given by the school authorities, and this will now be extended to apply to those under 16 years.

The Trubilt Toy Co., Vancouver, B.C., was recently incorporated with a capital of $500,000. It is the intention of this company to place upon the market five new and extremely simple ideas in multiple building construction invented by H. V. Wesche, a Swedish construction engineer. The large factory formerly occupied by the Terminal Sash & Door Co., has been secured and the necessary machinery, some of which has been specially designed, is being installed. Contracts are being given for a supply of alder bolts. This wood is preferred because it is smooth, hard and splinterless. The business in constructional toys is assuming large proportions. One of the well-known toy manufacturers featuring this line had a turn-over in excess of $13,000,000 last year. The prospects for the Trubilt Toy Co. appear to be exceptionally bright.

W. Turner, manager of the Hardwood Flooring Department of the W. M. Ritter Lumber Co., Columbus, Ohio, visited Toronto recently on a business trip.

Personals

R. R. Gardiner, superintendent of P. W. Gardiner & Sons' plant at Galt, is spending some time in the South in an effort to regain his health.

W. J. Markle, superintendent of the woodworking plant of the Boake Mfg. Co., Limited, Toronto, recently had the misfortune to slip and fracture his leg.

W. H. Cushing, of Cushing Bros., Limited, who operate a large woodworking plant at Calgary, Alta., was in Toronto recently on business and called on several members of the trade.

S. F. Rutherford, managing director of the Dominion Box & Package Company, Montreal, has been elected a member of the committee of the Montreal branch of the Engineering Institute of Canada.

L. L. Brown, B. C. Lumber Commissioner for Eastern Canada, is planning a two-months automobile tour of Western Ontario. He contemplates visiting every town of any importance and calling on the various woodworking firms. His work will be purely educational in the interests of B. C. timbers and forests products. It is his intention to cover the Maritime Provinces in a similar way later on in the year.

Obituary

Archibald Lang, Sr. recently passed away at Toronto. Mr. Lang has been for many years superintendent of the National Casket Co., Toronto.

A. G. McGregor, manager of the Canadian Pipe Co., Limited, Vancouver, B.C., recently passed away at Ottawa, Ont. Mr. McGregor was born in Ontario 54 years ago. He moved to Vancouver, B.C., in 1905 and for the past few years has been engaged in the manufacture of wood pipes.

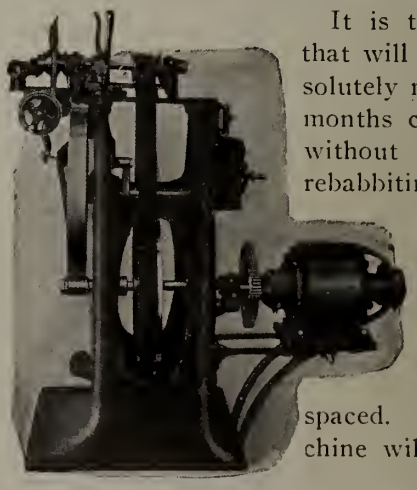
Chas. Slemin, vice-president of the Yawman & Erbe Mfg. Co., Rochester, N.Y., an associate organization of the Office Specialty Co. of Newmarket, died recently at his home in Rochester. He was born in Toronto 62 years ago and had been with the Rochester company for the past 30 years. Mr. Slemin was the father of Harry T. Slemin, managing director of the Office Specialty Co., Newmarket, Ont.

John Piggott, the well-known lumberman and woodworker of Windsor, Ont., recently passed away at the age of 78 years. Mr. Piggott was favorably known throughout Western Ontario where he conducted business in Windsor and Chatham under the name of John Piggott & Sons. This company was reorganized two years ago when the sons bought out the father's interests, Percy G. Piggott taking possession of the Chatham business, changing the name to P. G. Piggott Lumber Co., and Walter T. Piggott assuming the Windsor end of the organization under the name of W. T. Piggott Lumber Co. The Chatham business was founded in 1869 and was extended to Windsor in 1894 when the interests of W. G. Nutson, Windsor, were purchased.

The Berry Combination Band and Circular Automatic Saw Sharpener

Belt or Motor Driven. Capacity: Bands, 3-16" to 4", Circulars 4" to 32". Simple, Universal, Automatic in Action.

It is the only *combination* grinder that is *automatic*



It is the only grinder that will grind a saw absolutely round after three months continuous use—without readjustment or rebabbiting. It will take an unevenly spaced, hand-filed saw and make it perfectly round and even spaced. No other machine will do this.

For All Shops Using Circular or Band Saws

The Berry Tooth is far superior to the ordinary peg tooth. All teeth are alike, evenly spaced—ground right from the center. A saw ground with this machine does twice the work in half the time.

Write for Booklet to-day.

O. V. HOOKER & SON

St. Johnsbury Vermont

Once upon a time

Why our Gum does not stain

Gumwood was despised; considered a cheap unreliable wood. Today its use predominates in the higher grade manufactures and crafts.

What has brought about this change?

Intrinsic merit partly, but **improved methods of production, handling and treatment are the important contributing factors.**

True, some manufacturers, attracted by low prices on an inferior product of Gumwood, lacking the necessary care and attention in handling and treatment, continue having some difficulty, but this is **unnecessary and tremendously expensive.**

The **right kind of Gumwood** offers to the purchaser the greatest value for the money expended of any wood on the market.

The price of the best is so low—intrinsic value considered—that it is folly to be tempted by a slightly lower price on inferior stock.

The lowest intial cost invariably means a higher ultimate cost. **It is the ultimate cost that determines value.**

Our Kraetzer-Cured Gumwood represents the acme of quality and dependability: as straight and flat as any wood, and bright, free from the stain and discoloration, which many people think must be expected in the sap part of Gumwood.

And uniform—one board like another; one car like another. These things can be accomplished by **no other means** and obtained from **no other source.**

Only the very rich can afford the extravagance of poor quality. Every board is branded.

One reason why our Gum is Straight and Flat

THERE IS NONE BETTER.

Electricity in Glue Room

Another application of electricity that is finding favor in woodworking plants is in connection with electric heaters for heating animal glues. This type of glue pot, or heater, has advantages possessed by few other methods of heating glue. With the electric heater there is no flame, no gas, no smoke, no soot, no steam, only a clean pot and a flexible cord.

In many types of electric heaters the glue is automatically maintained at the correct temperature, ensuring satisfactory results. For the most satisfactory results glue should be maintained at a temperature of 140 to 150°. If the temperature is allowed to rise above this point, the adhesiveness and strength of the glue is impaired, perhaps causing trouble from open joints or loose veneers at some later date. It has been stated by experts who have made a study of glues that when the temperature is permitted to climb as high as 185°, the glue is rendered practically useless.

Electric glue heaters may be divided into two classes—wet and dry. In the wet type, a water jacket or bath surrounds the glue pot proper, while in the dry type the water is replaced by a suitable heating unit and the glue pot is surrounded by a heat insulating dead air space. Where the automatic temperature control is used, it can be adjusted to maintain the glue at any desired heat. In another type provision is made for three different temperatures—low, medium and high. The high heat is used for melting only, and as soon as the glue is brought to the working temperature the medium heat is turned on. The low heat is used when the heater is not in use but when it is desired to keep the glue hot and ready for instant use.

Some of the advantages claimed for electric heaters are that there is no burned glue; that they are portable and can be attached to any lamp socket; that they are safe, clean and eliminate all fire risk. These are features which should command this type of heater to all woodworkers.

When to Machine Casein Glue Joints

Casein glue sets very quickly and produces a joint strong enough to machine in a few hours. In tests at the Forest Products Laboratory casein glue joints in spruce proved as strong as the wood after 4 hours and in hard maple after 6 hours. When maximum speed of production is essential, such woods may be machined at the end of the periods stated, without sacrificing the strength of the joint. In some kinds of work, however, machining so soon after gluing is not advisable, because of the danger of warping or the production of sunken joints as the moisture content of the glued wood equalizes.

Another important act brought out by the tests on joint strength is that joints released from pressure at the end of 2 hours and then allowed to season for 22 hours proved as strong as those that had been pressed for 24 hours. Joints pressed for only ½ hour and seasoned, although of good strength, on the average, were somewhat erratic in this respect and probably would not be dependable where maximum strength is important.

It is a big asset to a firm when the employees realise that they can always depend on it for a square deal.

The Sidman Lumber Curing Dry Kilns

Here is shown a Class D Kiln having a capacity of 30M per week of Hardwood lumber at the plant of the

STEVENS-HEPNER CO. Ltd.

PORT ELGIN, ONT.

This Kiln is poured concrete with an air spaced roof. With our design it is both moisture and heat proof. Making a good and inexpensive kiln building where you can get gravel and sand free from dirt.

We also have these concrete kilns in two plans each in Southampton and Walkerton, and at Hespeler, Ont.

Do not forget! All Sidman Kilns are made in Canada. No duty or exchange to pay.

Don Pedro Dam to be Built by Day Labor

After twice receiving and rejecting bids for the construction of the Don Pedro dam on the Tuolumne River, California, to store water for the use of the Turlock and Modesto irrigation districts in the San Joaquin Valley, a joint board has decided to have the work done by day labor instead of by contract.

The dam is to be built on a simple curve with a radius of 675 ft. It will be 280 ft. high, 975 ft. long on the crest, and will contain 266,000 cubic yards of concrete. Only about 10,000 cubic yards of excavation are said to be necessary to expose solid rock underlying the site, but about 120,000 cubic yards of excavation will be made in cutting a spillway channel in the canyon wall at the north end of the dam.

The construction program includes building a narrow gage railroad from the Southern Pacific line at Hickman to the dam site, a distance of 29 miles. About 12 miles from the dam site this railroad passes through gravel pits from which gravel for the concrete will have to be taken. It is estimated that the work can be completed in two years time at a total cost of approximately $4,000,000.

The Opportunity Is Yours

Investigate the following dependable and up-to-the-minute used Wood Working Machines:

"Subject to prior sale"

CORDESMAN Band Resaw, 42" wheel, 5" blade, rolls open 3" each side of saw blade.

1—**WOODS** 15 x 6" Planer and Matcher, in excellent condition. Recently replaced by Yates Fast Feed Machine.

MACGREGOR 26" x 8" Double Surfacer, an excellent buy.

YATES No. 160 Double Surfacer, 30 x 6". This machine has been rebuilt and is as good as new.

H. B. Smith 8" Sticker, in excellent condition.

Must the Printing Industry Follow the Building Trades to Stagnation?

An unheard of condition exists in the building trades in Canada.

Everywhere there is a crying need for homes, but practically none are being built.

Why?

Because the cost is considered prohibitive. Labor and materials are so high that the man who contemplates building a home for himself counts the cost, and decides he cannot afford it.

The result, of course, is increased demand for houses to rent—and higher rents—and no one knows the end.

We don't want this stagnation to occur in the printing industry, but employers are right now faced with a demand from the International Typographical Union that the 44 hour week shall be the basis for all wage scales and the Toronto Unions are demanding a wage of $44 per week. This will add 36 per cent. to the wage bill of Toronto job printers and publishers, other than those of daily papers.

Does anyone feel that under present economic conditions an increase from 73c per hour to $1.00 per hour for printers is justified?

Does anyone believe that the effect of such an increase in the labor cost of printed matter, can be other than harmful to the industry as a whole?

Printers can only find employment as long as users of their product continue to buy.

Will there not come a time, when—if costs keep on mounting—printers will find themselves in the same position as many highly skilled carpenters, bricklayers, plasterers, and painters are now in. They are willing and anxious to work but cannot find a market for their services.

This is a matter in which the buyers of printing—the subscribers to this and other papers—and the advertisers—are vitally concerned. An increase of 36% in the wage bill of publishers would necessarily involve an increase in subscription price and advertising rates.

That is plain.

Publishers would be very reluctant to add one cent to the present subscription price of their papers or to effect any increase in advertising rates, but they cannot possibly absorb any such addition in wage costs as is proposed, and stay in business.

An expression of the opinion of readers of this paper on the Unions' proposals, involving an increase of 36% in the labor cost of printed matter, is asked. Will you not write a letter to the editor (not for publication) telling him your view of the situation.

Don't let us drive the printing industry into the condition of the building trades.

This statement is published by and has received the endorsation of the Toronto publishers who are members of the

Canadian National Newspapers and Periodicals Association

including Canadian Woodworker and Furniture Manufacturer.

Cary's SUPERIOR QUALITY Corrugated Fasteners

SAW EDGE

PLAIN EDGE

According to final decision, after long litigation, we have been granted the SOLE RIGHT to manufacture a Saw Tooth Corrugated Fastener with a continuous cutting edge. Our fastener is beveled evenly on both sides, which enables fasteners to be driven in straight, and much easier than any other fastener made. Our Corrugated Fastener is made in various widths and corrugations, also in coils wound right and left. Try our products and you will use no other.

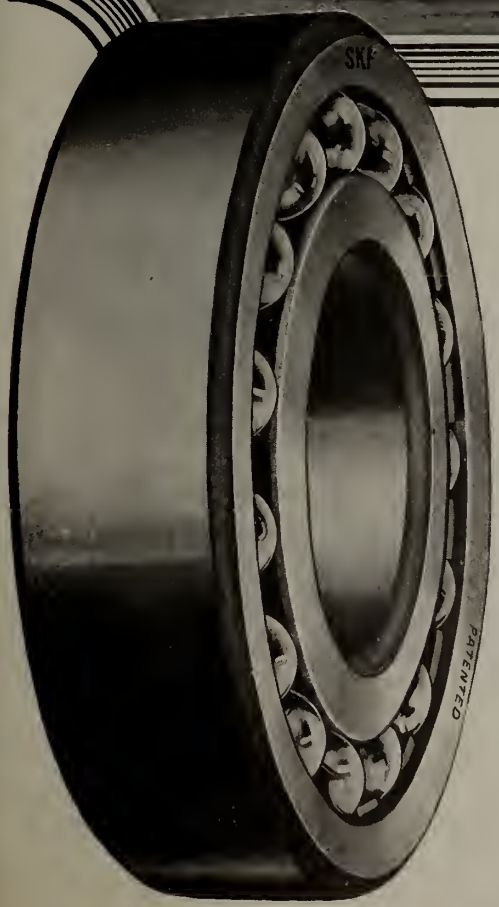
SKF



WORLD-WIDE EXPERIENCE
At Your Command

It has taken years to gather from every part of the industrial world the information that **SKF** engineers place freely before the Canadian manufacturer.

Not to use it is to ignore hard-earned experience gained in thousands of industrial plants.

SKF engineers are more than doctors to troublesome transmissions or inefficient machines, they are constantly required to show ways of improving this product, and cutting costs. They also place at your service a complete industrial laboratory where new manufacturing problems are solved for the benefit of all industry.

Consult Canadian **SKF** Engineers without cost or obligation.

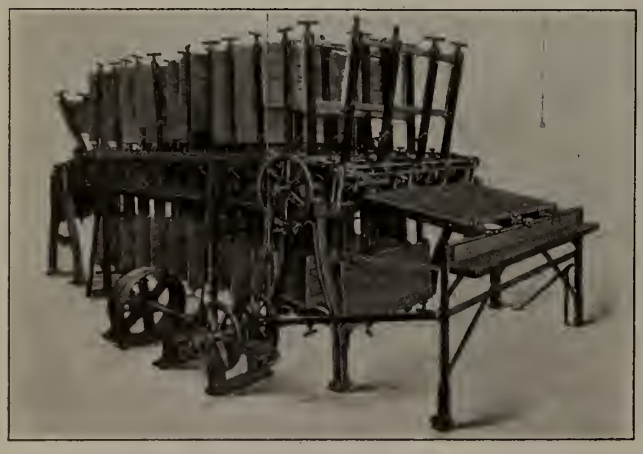
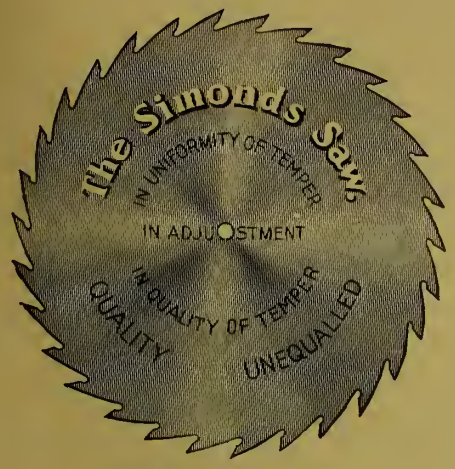
One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier



For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.



SIMONDS
SAWS and KNIVES

Are made right. Every operation from the making of the steel to the finishing and packing is watched by experienced workmen. The latest appliances known to the metal trades are used to insure the quality of SIMONDS Saws and Knives. After each operation they are inspected by experts for defects in quality and workmanship. The result—as good a saw as human skill and science can make. Prove it to your own satisfaction. Let us quote you on the tools you need.

Simonds Canada Saw Co.

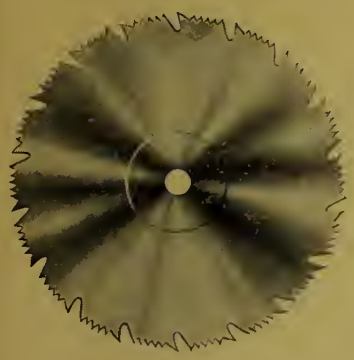
ATKINS

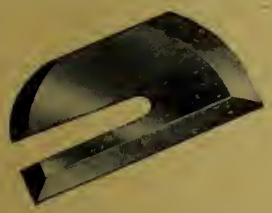


STERLING QUALITY

SAWS and KNIVES

The best steel—the most careful and accurate workmanship—the equipment that will eventually save you money.

Atkins Sterling Quality Saws and Knives are proving their superiority by competitive tests in the largest plants of the country. We welcome your most careful investigation, as we know the satisfaction that will result.



Write to-day for our Knife Booklet "C W"
and Pattern Template Paper.

E. C. ATKINS & CO.

Makers of Sterling Saws

Factory—HAMILTON, Ont. Vancouver Branch—109 Powell Street

"176" in factory of Western Furniture Company, Indianapolis, sanding inside curved edge of a circular cabinet panel against solid sanding roll. The curved frames on the trucks are similarly finished at a very considerable saving over other methods.

MATTISON

176

Oscillating Belt Sander

For Edge and Shaped Work

Successfully employs stationary forms

This shows a narrow-nosed form which provides an accurate and economical method for sanding the curved and flat members of both square and octagonal pieces. The sanding is done with the grain, and the stock is handled but once.

BECAUSE of its substantial construction, this sander is entirely free from vibration, making the use of special forms completely successful.

This feature provides a superior method for sanding the small, flat curves of ornamental square or octagon legs, pilasters, etc. The work is accomplished quickly, accurately and economically. Oscillation of the sandbelt improves quality by eliminating scratch marks.

Such a large variety of flat and curved edge work can be completely finished on this Oscillating Belt Sander, that no furniture factory can afford to do without it.

Send for Illustrated Bulletin Describing this Method in Detail

MATTISON MACHINE WORKS

Rockford, Illinois, U.S.A.

Volume Twenty-One TORONTO, JUNE, 1921 Number Six

CANADIAN WOODWORKER and Furniture Manufacturer

ANOTHER NEW ONE!

This Time it is

A Whitney Direct Motor Driven Bit Mortiser

The Motor is Mounted directly on the Spindle

No Countershaft
No Belts
No Pulleys
Saves Floor Space
Saves Belt Expense
No Slowing Down of Bit

Cuts mortises of uniform depth the entire length.

Makes any size mortise up to 1 1-2 in. wide, 4 1-2 in. deep, and 6 in. long.

Machine can be equipped with power feed for table ifdesired.

No Soldered Joints or Bolted Connections in

Canadian Crocker-Wheeler Rotors

The greatest improvement in modern induction motor design—no soldered joints to melt and cause arcing or open circuits and no bolted connections to work loose. The risk of fire as well as the possibility of motor troubles and consequent delay, is thus greatly reduced if not eliminated entirely.

The entire Rotor Winding of small squirrel-cage induction motors is cast of aluminum alloy—in one operation. Thus, the complete winding is one integral structure.

The medium and large size Rotors have liberal section copper bars and the end rings are cast-welded, making perfect contact.

The generous bearing sizes and sturdiness of mechanical construction throughout, further emphasizes the superiority of our motors for woodworking plants.

These machines will save you money. They are priced to sell under present conditions. All in our Dufferin Street Warehouse, subject to your inspection. Quotations on machines for any purpose on request.

1—McGregor-Gourlay Double Arbor Universal Saw Table, same as C.M.C. No. 618, with 14" saws, self-contained countershaft, full complement of gauges, saws, wrenches, etc.

1—Preston No. 127 Variety Saw Table, countershaft attached, one 14" saw.

1—Ballantine 36" Band Saw, with solid lower wheel, complete with saw blades, wrenches, etc.

1—Ballantine Two Spindle Shaper, Spindles 20½" centres, diameter of spindles where collars go on 1⅛", top 42" x 42".

1—American No. 1 Single Spindle Shaper. Fig. 937 with plain countershaft.

1—C. M. C. No. 507 Mortiser, with boring attachment.

1—C.M.C. No. 624 Hand Feed Rip Saw Machine, with self-contained counter shaft, table 6'6" long by 40" wide, with plain box gauge, 22" saw blades, 1¼" arbor with cone for receiving saws different diameter.

1—Ballantine 8" Four Sided Moulder, complete with square heads and straight knives on all heads.

1—American No. 2½ Single End Tenoner, with two copes and cut-off saw attachment. Fig. 9431 in American Woodworking Machinery Catalog.

1—C.M.C. No. 646 Roller Table Cut-off Saw, sliding table 7'6" long, stationary table 50" to the saw, sliding table equipped with stop gauge, including five stops, with countershaft, complete with saws, wrenches , etc.

1—Cowan Combination Vertical and Horizontal Boring Machine, complete with wrenches, etc.

1—Hespeler 12" Buzz Planer, fitted with round cylinder, full set of knives, countershaft, wrenches, guard, etc.

1—Preston 36" Band saw, lower web wheel and guards.

8—Sections Cowan Four Screw Veneer Press 12"x50", four sections 27" clear space under screw plates, four sections 32" under screw plates.

1—24" Francis Double Roll Glue Spreader.

4—Sections Cowan Three Screw Veneer Press 38"x12", 28" clear space under screw plates.

1—American No. 4½ Single Surfacer, with solid roll and chipbreaker.

1—American No. 26, 10" Outside Moulder, 4" side heads, latest type machine, complete with knife jointers and all equipment, new straight knives on all four heads.

1—C.M.C. Arm Sander, No. 438, with paper cutter.

1—Universal Knife Grinder, 37", made by American Wood Working Machinery Co., Fig. 1126 in their catalogue.

1—60" Sturtevant Single Slow Speed Exhauster, left hand, top vertical discharge, complete with platform and rods to suspend from ceiling.

1—Cowan Chain Mortiser with grinder.

1—Ballantine 36" Band Saw, lower web wheel.

1—American No. 3 Double Cut-Off Saw, new machine, capacity from 8" to 6' 9" in length, 4" thick and 30" wide.

1—American No. 25 Edging and Ripping Saw, new machine.

1—American No. 30 Double Arbor Universal Saw Bench, new machine.

1—Preston 24" No. 121 Pony Planer, used only couple of months.

1—McGregor-Gourlay 24" Pony Planer.

1—Mershon Band Rip Saw.

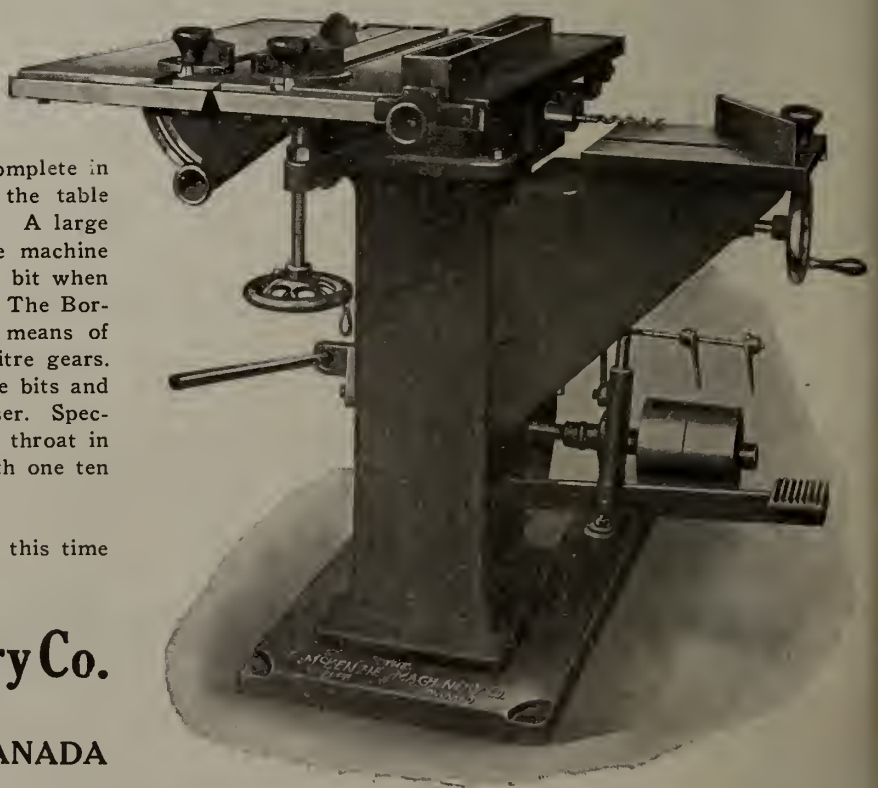
WEBER-KNAPP CO., Jamestown, N.Y.

The Handiest Machine on the Market

The Split-tilting table (Patent Applied For) can be tilted and locked at any angle up to forty-five degrees as indicated on the graduated segment. This machine is also supplied with a solid table. The Boring Attachment is very complete in itself. A foot lever is connected with the table which slides back and forth on the knee. A large coil spring located in the column of the machine automatically releases the work from the bit when pressure is removed from the foot lever. The Boring Attachment is raised or lowered by means of a handwheel connected with a pair of mitre gears. The spindle is bored to take standard size bits and can be arranged for a hollow chisel mortiser. Special cutters may be used by removing the throat in the table. Each machine is furnished with one ten inch saw, belt and wrench.

Write for prices and pamphlet describing this time and labor saver more fully.



Cross-cut Mitre & Rip Saw Machine showing Split-Tilting Table & Boring Attachment

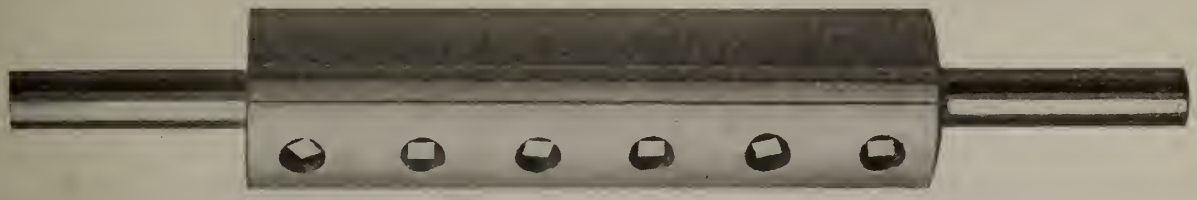
MANUFACTURERS

GUELPH, ONT. CANADA

The Shimer Round Safety Cylinder with High Speed Knives



A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

The only

VENEER JOINTER

that will effectively joint buckled veneer

No. 181 "Preston" Veneer Jointer

THIS MACHINE was designed and built for the purpose of making commercially perfect face joints butt or crosswise as well as lengthwise of the grain on the highest figured circassian walnut or crotch mahogany veneer.

One of the most essential features of a machine of this kind is RIGIDITY. Examination of the frame or column on above illustration will show the massive construction of same which is of cored section and cast in one solid piece. This guarantees absolute accuracy in the table Vee ways at all times, thus contributing to a perfect joint being made on straight or curly stock at one operation.

The Preston Woodworking

THREE GUESSES

Electric power, heating, lighting and equipment problems are to be found in the woodworking industry.

Perhaps your output can be increased? You are, perhaps, losing electrical energy by wasteful types of motors? Are your switches and wiring devices up-to-date or are you in continual danger of fire?

We shall be pleased to answer any questions or help you with any problems whenever you care to write us.

THE VERY BEST

West Side Iron Works

Factory: GRAND RAPIDS
General Offices: CHICAGO

West Side

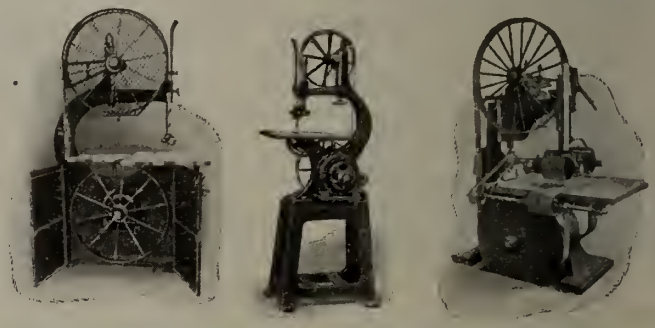
Band Saws for these reasons:

To operate a West Side band saw—or even to see one—is to realize what careful experienced designing means to machines of this character. Most convenient of operation: uncommonly strong.

We build band saws of convenience and capacity, each model with choice of **three drives:** direct motor—belt—gear.

MOTOR DRIVEN BALL BEARING No. 78

—illustration to the left is of our 42-in. straight column frame band saw possessing important superiorities. Trus-running; perfectly balanced; improved work table for quick, accurate angle work. Ask for full information.

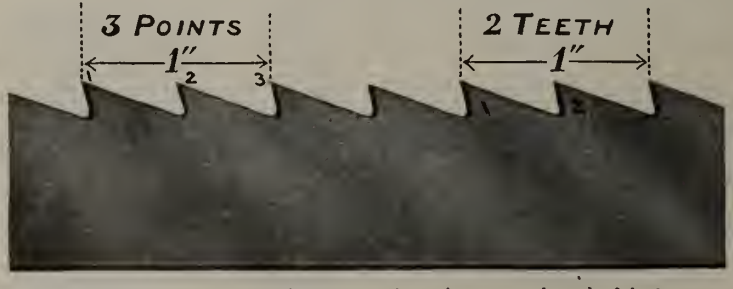


Speed Up the Work

No Breakdowns - No Delays

With

"BEAVER" BAND-SAWS



NOTE—When measuring points count the points at each end of inch, as per illustration. 3 points are two teeth, etc.

When there is a big cutting job ahead in the sawmill, box factory or woodworking shop, RADCLIFF SAWS are the ones to rely on. They will give you the greatest satisfaction.

BEAVER BAND-SAWS are made from the highest grade Swedish Crucible Steel—keen-cutting and strong. Let us send you particulars and prices.

Will do the work of Five Hand Jointers in making Glue Joints

This is the guarantee given with our

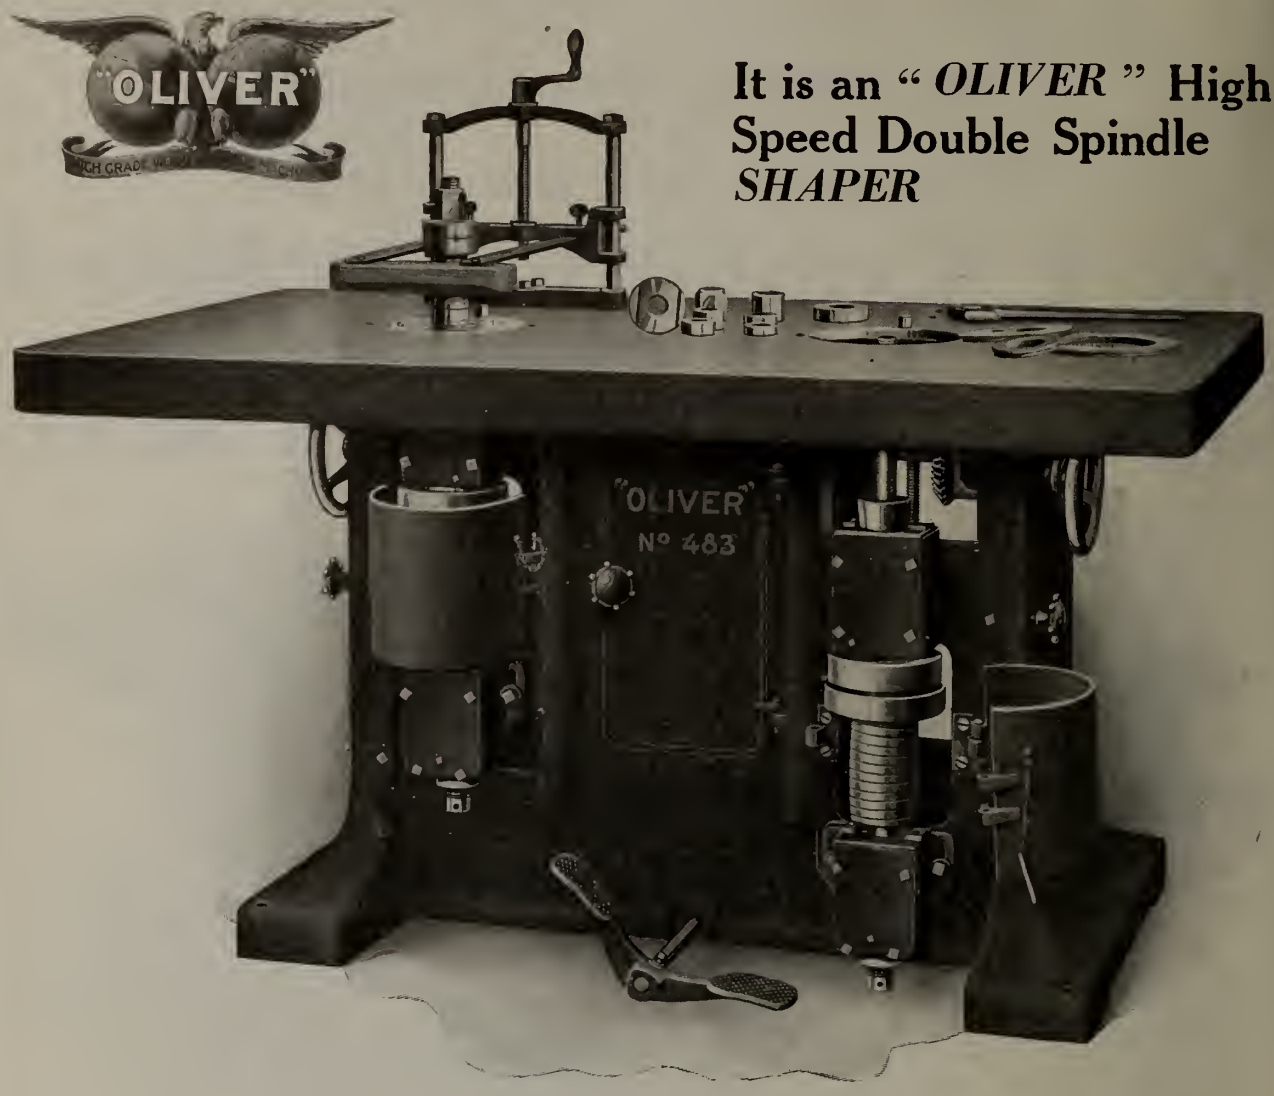
No. 4 Continuous Feed GLUE JOINTER

Strongest and most complete machine on the market.
Any part may be readily removed or renewed.
Feeds in opposite direction, giving 100 feet per minute.
Works material from six inches up to any length desired.
Also from one quarter to 3 inches thick, and from three-quarters of an inch wide up to any width.
1 set Shimer Special Jointer Heads supplied with machine.

Investigate the merits of this machine—it will pay you!

Jackson, Cochrane & Company

KITCHENER - CANADA



It is an "*OLIVER*" High Speed Double Spindle *SHAPER*

It is simple in design; powerful in action; durable in operation; second to none; leader of many. The forced self-oiling Ball Bearings permit of very high speeds and quantity as well as quality of output.

Send for particulars of the Shaper and also the Universal Motor Drive applicable to any Double Spindle Shaper. This drive consists of floor plate supporting two vertical columns, each independently adjustable and each bearing a standard vertical 3400 RPM motor.

Oliver Machinery Company

Grand Rapids, Mich., U. S. A.

Eaglesfield "BELTLESS" SWING SAW

Announcing——

A new design with special high-torque small-diameter

MOTOR DIRECT ON ARBOR

In addition to the present type of EAGLESFIELD BELTLESS SWING SAW, motor gear-connected, which was put on the market in 1919, we now announce a new design, with motor mounted directly on 2-in. spindle—gears entirely eliminated.

With ample power for saws up to 24-in., this new design permits a range of cutting from the small shop requirements up to heavy-duty service in car shops and saw mills.

Motor connection takes up only 3½ in. of saw, leaving ample clearance—as on a 24-in. saw, 8¼-in. cutting surface is available. Saw can be trammed for more accurate cutting than you have been accustomed to.

The unified hanger construction, resilient spring action, and the 7-in. section column are identical with the gear-head machine.

Motor is of the enclosed, built-in type, 25 or 60-cycle, 2 or 3 phase, any voltage. Extra large size S K F ball bearings. Saw up to 24-in. included in equipment.

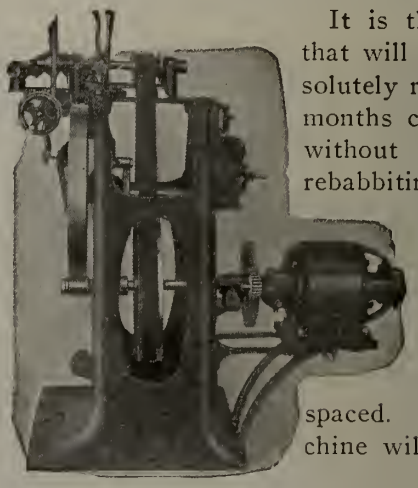
The Berry Combination Band and Circular Automatic Saw Sharpener

Belt or Motor Driven. Capacity: Bands, 3-16" to 4", Circulars 4" to 32". Simple, Universal, Automatic in Action.

It is the only *combination* grinder that is *automatic*



It is the only grinder that will grind a saw absolutely round after three months continuous use—without readjustment or rebabbiting. It will take an unevenly spaced, hand-filed saw and make it perfectly round and even spaced. No other machine will do this.

For All Shops Using Circular or Band Saws

The Berry Tooth is far superior to the ordinary peg tooth. All teeth are alike, evenly spaced—ground right from the center. A saw ground with this machine does twice the work in half the time.

Write for Booklet to-day.

Perkins Vegetable Glue

PERKINS 183 was the FIRST VEGETABLE GLUE ever sold to high grade woodworking concerns and PERKINS 183 is now the last word to be said of a HIGH GRADE, UNIFORM QUALITY GLUE. Much money and effort have been spent on work covering a period of years; many changes were made in the formula until the present manufacturing process of 183 was reached and for fourteen years this glue has successfully filled the requirements of HIGH CLASS GLUE. Both our research and factory laboratories are constantly working to improve manufacturing methods and we shall never be satisfied to give the trade anything less than the best.

The Home of

PERKINS 183

TRADE MARK (Reg. U.S. Pat. Off.)

Our Canadian Factory is located at Hamilton, Ont.

Process and Product Patents covering Perkins Glue were granted July 2nd and March 19th, 1912, and have been held valid and infringed by the United States Circuit Court of Appeals. Patents have also been granted in Canada, Great Britain, Germany, France, Belgium, Italy and other foreign countries.

Quick Repair

For repairing splits, checks and other defects in face veneers. Made in colors to meet the requirements of the best finishes of all cabinet woods.

Put up in tubes for convenient use on surface stock and in quart cans for larger defects in core stock.

PERKINS GLUE COMPANY

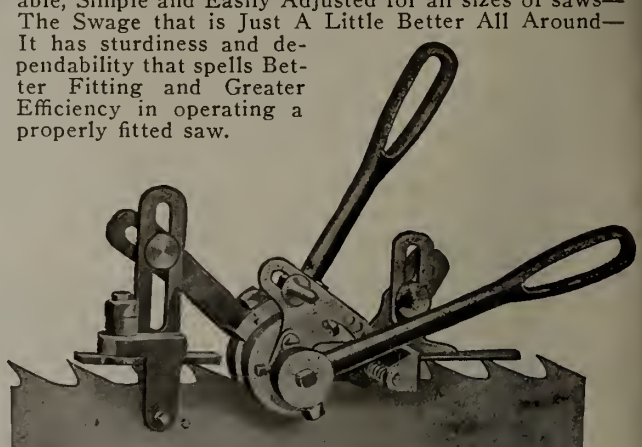
Quality Higher--Price Lower

The construction of the Crowell Swage is the secret of CROWELL SUPERIORITY—Right Design, Reliable, Simple and Easily Adjusted for all sizes of saws—The Swage that is Just A Little Better All Around—It has sturdiness and dependability that spells Better Fitting and Greater Efficiency in operating a properly fitted saw.



D. J. CROWELL
61 TERRACE, BUFFALO, N.Y., U.S.A.

Art Fibre

Art-Fibre is all that its name implies. Spun from the finest quality of sulphite stock, its smooth uniform surface produces results when properly finished, that correlates with the most artistic designs and the finest quality of upholstering materials.

Because of its known reliability, economy, and excellent quality ART FIBRE SERVES BEST.

Samples and prices sent upon request.

GRAND RAPIDS FIBRE CORD CO.
Grand Rapids, Michigan

An Efemco Product

The Metal Bed Caster with four-point contact for RIGIDITY

This new EFEMCO CASTER fits both square and round post tubing. Inserted in the post, its powerful spring expands, forming a four-point interior contact with the walls, which holds it upright. The grooved portion forms a perfect bearing, allowing the caster to turn freely. These exclusive EFEMCO features make for better metal beds -- or iron cots.

We can supply this caster in the ball or roller-bearing types. Up to 1½ inch sizes it is finished with cupped washers. Above that size with leg mounts.

Made to fit tubes of the following sizes in iron pipe—⅞", 1", 1 1/16" 1¼" and 1½". Round tubing—1½", 1 9/10", 2", 2½" and 3". Square—1½", 2", and 2½".

We can supply this caster with maple, lignum-vitae, steel, iron or fibre wheels. It's a genuine EFEMCO Product and of the usual EFEMCO quality and dependability.

Write for catalog showing new lines of improved Efemco Casters.

Performing An Imperative Service

In no phase of our business is care more thoughtfully exercised than in the selection and training of men for their places in this organization.

The importance of this will be recognized by those who realize the value of fire prevention work.

Our insurance policy is not only a guarantee of prompt payment of fire loss, but it also carries with it a service that includes a regular fire prevention inspection on your property.

A thorough fire prevention inspection may save your property from destruction, and it will also assist a great deal in accumulating larger savings which will result in better insurance for less money.

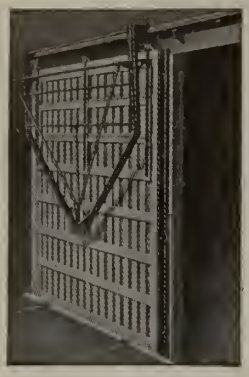
GORHAM PLYWOOD

is well and favorably known in Canada as well as the States and its use in the form of Tops, Drawer Fronts, End Panels etc., in your product, will be a long step in securing the confidence of your customers which will result in orders and re-orders.

Our trademark is stamped on the back of every Top and Panel we make. Our guarantee that it is right and will stay right.

Gorham Brothers Co.
Mount Pleasant, Mich.

The Door Carrier System



Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.
Ask for catalogue.

Since Colonial Days

Oak Floors have been the standard in representative American homes.

Oak Flooring is recognized — almost by second nature — as the *best* flooring material for homes of every type and size.

In public and semi-public buildings, apartments, hotels and offices it is the logical *first choice.*

Bruce OAK FLOORING THE BEST *Oak Flooring*

has definitely established its super-excellence in homes and buildings from Coast to Coast.

In addition to its intrinsic worth, Bruce Oak Flooring affords the trade a merchandising service seldom equaled in precision and convenience. *Dealers can always get it.*

Square edge parquetry strips, Oak trim, mouldings and hardwood lumber in the same car with Oak Flooring if desired. Prices and particulars on request.

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS WALNUT."

AMERICAN WALNUT

"The Cabinet-wood Superlative."

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS WALNUT."

WALNUT—"*THROUGH and THROUGH*"

PUBLIC INTEREST in genuine American Walnut furniture—"*Walnut Through and Through*"—is rapidly increasing, due to the beauty and exceptional qualities of this historically superior cabinet-wood.

This Association is constantly receiving evidence of this from many sources.

Information of this sort provides a Valuable Guide to profitable business for the makers and distributors of fine furniture—doesn't it?

Our National advertising—extended and strengthened
—is carrying to the consumer this message:

"BE SURE YOUR WALNUT IS WALNUT."

THE AMERICAN WALNUT MANUFACTURERS' ASSOCIATION

OUR MOTTO

REASONABLE PRICES—that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

TO MEET COMPETITION

It will be necessary to put better lumber into your product. Indiana Oak is known to be the best. It costs no more than the other kinds—then why not get it?

We are the largest manufacturers of hardwoods in Indiana and give you below a partial list of the stock that we have ready for shipment:

We also have good stocks of Poplar, Ash, Beech, Hickory, Maple, Gum, Tupelo, etc.—Write us for prices.

Maley & Wertz Lumber Company

EVANSVILLE, INDIANA

We guarantee that our Walnut Lumber after having been steamed in our Steam Kilns for four days, then placed on sticks for six days, during fair weather, can be placed in your Dry Kilns immediately and dried with greater safety than unsteamed lumber, green from the saw and placed on sticks for ninety days. This method of steaming lumber enables us to furnish material without delay.

QUALITY

SERVICE

Full loaded capacity of nine kilns, 100,000 feet.

American Walnut Lumber

All grades and thicknesses

Pickrel Walnut Company

St. Louis, Missouri

Stimson Veneer and Lumber Co.

- 10 cars 10/4" Log Run.
- 10 cars 12/4" Log Run.

MAPLE
- 4 cars 12/4" Log Run.

THE above photograph was taken at one of our logging camps and illustrates the up-to-date equipment used in all our operations from the stump to the lumber on our yards.

The five Oak logs shown on the trailers are each 12 feet long and were all cut from one tree, the butt cut measured fifty-one inches in diameter. These five logs measured 6,489 feet.

We operate two modern band mills on our own timber, and manufacture all the lumber we ship, which enables us to furnish stock of even grade, color and texture.

We will appreciate an opportunity of serving you and will be pleased to quote you at all times.

Manufacturers of all kinds of high grade Southern Hardwoods.

"What Others Say"

"Your letter of February 15th received and we want to say that this was a very nice lot of lumber. It was good widths and lengths and well manufactured, dry stock and the grading was very liberal. We are sorry we cannot use more of this lumber at the present time. *We received several cars from other manufacturers at a cheaper price but the lumber was not nearly as satisfactory.* When we are in need of more stock we will take the matter up with you."

(Note—The above was sent us February 24, 1921 unsolicited. Name given on application).

No more important service can be rendcredbusiness in general than to help sccure a fair reduction of freight rates.

While the railroads have not yet announcedtheir position, it is intimated in well informed circles that ttheir view is:

That the failroads cannot afford to decreasc their revenue.

That they must be guaranteed that the de-creasc in rates will assure larger tonnage.

That freight charges are but a small part, in any event, of total cost of anything, of the complete house, for example.

Some thought should convince everyone.

That decrease in rates will enable thc rail-roads to earn a greater total of revenuc, than can be had from the present prohibitive rates.

That the logic of a reduction would be to stimulate all activity and consequently to progressively increase the tonnage to be carried.

That the contention that the element of freight is so comparatively small in thc total is not sound. The same claim could be made in respect to evry in gredient going into a building.

Lumber represents only about 8% of the cost of a representative building. No onc item (except labor) standing alone, represents a large per centage of the total.

The attitude of the railroads, if takcn by all, would mean that no reductions would be made; and this reduces the position to an absurdity.

Lumber is as low as it should be; to this allgree. Let the railroads reduce rates.

Let all others, who havc not reduced, do so at once—and let business activity get under way with full momentum.

Otis Manufacturing Company

Peters Avenue and The River

NEW ORLEANS, LA.

Chicago Office: Room 208, 128 N. Wells Street

On October 17, 1906 the S. S. "Corinth" sailed from Axim, Gold Coast, Africa, to Pensacola, Florida, with the first full cargo of mahogany logs ever shipped from the continent of Africa.

Prior to 1860 complete cargos had sailed from Africa, but the holds were laden with human freights from which was manufactured the great American Civil war.

From the valuable cargo aboard the "Corinth" was produced the beautiful and the useful—a contribution to the prosperity and civilization of America.

To the successful venture of this pioneer ship is largely due the position and influence of African Mahogany in the wood artistry of today.

It is immaterial that the Mengel Company were the operators of this ship and the owners of this cargo.

The Investment Behind the Brand

THE dominant element in the hardwood producing trade is the large operator with a long-time investment which justifies perfect equipment and methods.

The accompanying illustrations picture the four factors which are the buyer's guarantee of conscientious service and quality in the WISCONSIN LUMBER COMPANY products. These photographs are used together here for the one purpose of visualizing the extent of our investment involving a many years' timber reserve, a modern town, a thoroughly up-to-date sawmilling plant, and a complete logging outfit with many miles or standard gauge logging rails.

Considering the matter strickly as a business proposition, would it be logical for a firm with such a tremendous investment to give anything but the highest possible type of product and service in marketing its output? The great expense in merchandising is seeking new customers. It is our belief that old customers now on our books more than justify every legitimate cost in keeping them there. That conviction is responsible for the guaranteed WISCONSIN LUMBER COMPANY lumber without a board picked out and with every piece branded.

Vol. 21 Toronto, June, 1921 No. 6

IT CAN'T GO ON.

A talk with a number of operators on woodworking plants could hardly help but convince one that, in an effort to secure business and keep their plants operating, many woodworkers are out after orders at any figure, utterly regardless of costs or profits. Instances are occurring almost daily which show the extent to which prices are being cut. The prominent sash and door man figured on a small bill of special sash and quoted $53.50 as his price. Later, on enquiring, he was surprised to learn that the order had been placed with a competitor who agreed to make the item for $34.00. This indicates too big a difference between quotations and, more than that, a careful checking of the estimate, figuring the mtaerial at present replacement value, shows that the lumber alone is worth $37. In addition to eliminating profit, throwing in all necessary labor, the successful bidder stood to lose $3 on the lumber used. Is that good business?

Another instance of the same nature is where a large woodworker, after careful figuring and after reference to cost figures obtained on similar work, quoted $1,750 on a bill of material for a house. A few days later he learned that a rival had undertaken the work at $1,335, a difference of $415. Checking his estimate did not disclose any errors, and by foregoing all profit, the best he could do was $1,575. Needless to say, the competitor secured the business.

The question arises as to what happened the successful bidder in each case. Did he make a profit? Did he know his costs? In each instance the high tenderer claimed to have based his figures on accurate cost records. That being the case, it would appear as if the concerns which undertook the work stood to lose on each transaction.

A manufacturing operation cannot be conducted at a loss and continue in business. Sooner or later the day of reckoning must come. tI is worth an effort and even a sacrifice of profits, if necessary, to keep the plant operating and the organization intact, but to throw discretion to the winds and cut, cut, cut just to beat the other fellow is an unwise policy to adopt, especially if guesswork happens to be the foundation of the cost figures, upon which quotations are being based.

There is only one intelligent way to conduct a factory, and that is to keep accurate cost figures, check them against costs and estimates and base all prices and quotations on the bed rock of knowledge. Several practical articles on this important subject are scheduled to appear in early issues.

Printers say: "Less work—more pay"

The employees in the printing and publishing offices in Toronto struck June 1st, as predicted in last issue.

They asked $44 for a 44-hour week, an increase of 36 per cent.

They were offered $36 for a 48-hour week—a little more than they received last year when the cost of living was at the peak. This was refused.

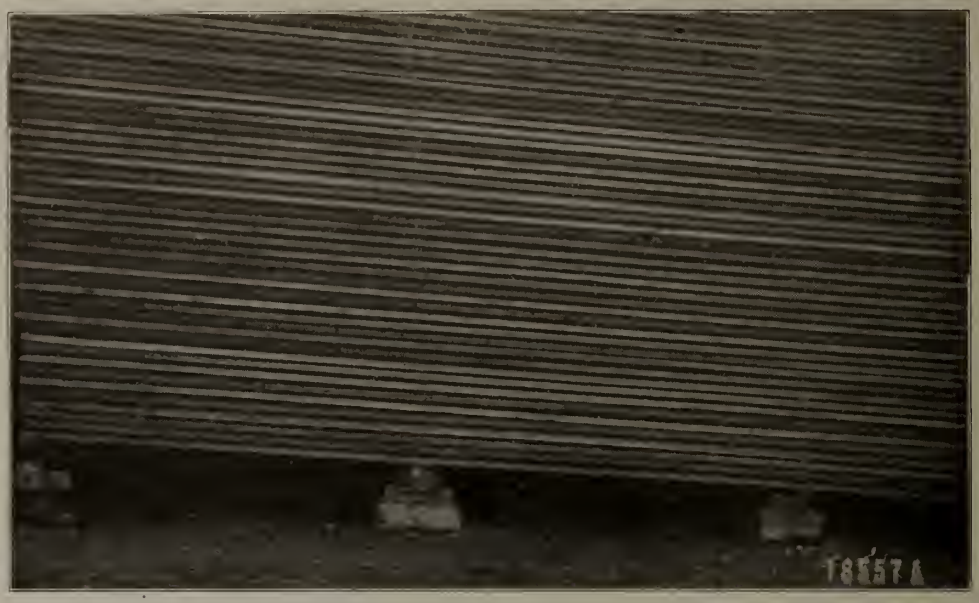
The publishers and master printers believed it to be their duty to protect the buyer of advertising and printing. The strike of union printers is the result.

Think of it—less work and a lot more pay at a time when it is most essential to increase production and get back to normal.

Unreasonable wage demands and shop rules which place employers at the mercy of the unions must be checked.

This issue is late. Others may be late or be suspended entirely, but we do not propose to yield until a fair settlement has been forced.

The battle, dear reader, is yours as well as ours. Be considerate.



Careful piling will keep lumber straight

Saving Dollars in Your Lumber Yard

How Percentage of Lumber Waste is Increased in Some Plants by Careless Methods—Observance of Simple Rules Would Eliminate Loss—End Checking May be Prevented

By R. N. Dormer

THE storage and handling of lumber so as to prevent loss from deterioration, checking and warping, is a subject with which all woodworkers should be familiar, yet a walk through the average lumber yard would tend to convince anyone that the very simplest rules for the handling of lumber are not being observed. This may be due to carelessness or lack of knowledge, but whatever the cause, vast sums of money are being lost annually through the deterioration of lumber stored in the yard.

Excessive warping due to lack of sufficient number of stickers and foundation timbers.

This fact was forcibly impressed upon the writer recently when visiting the plant of a well-known furniture manufacturer. The factory in question is supposedly modern in every respect both as regards to the equipment installed and the methods employed; yet in their storage yard lumber was being deliberately spoiled and degraded.

How Lumber is Wasted.

The most glaring fault noticed was that they were using five rows of stickers on a three-skid foundation. Thus the two centre rows of stickers did not have any bearing or support underneath and as a consequence the first ten or fifteen tiers of lumber were badly warped between the end and centre stickers. This was not an individual instance, but seemed to be applicable to the majority of the piles in that yard. Another doubtful practice noticed was that boards of random lengths were all piled in one pile. The long over-hanging ends naturally hung down and set in that position. Half a dozen piles handled in this manner might mean a loss of from one hundred to several hundred dollars, depending largely on the value of the stock and the purpose for which it is to be used.

There are a number of rules for piling and storing lumber, the observance of which would, without adding

to the cost of handling, go a long way toward reducing the loss occasioned to lumber while in storage. Such defects as warping, checking, discoloration and decay may be controlled and to a large extent eliminated through proper common-sense methods of handling.

Decay in lumber is due almost entirely to low forms of plant life, commonly known as fungi. These develop rapidly in most places where there is little or no ventilation, and when once formed spread very quickly. Thus in lumber piled solidly, or stacked in such a way that there is little chance of adequate ventilation, deterioration due to stain and decay is apt to be very rapid. The same holds true of lumber piled directly on the ground. The first few tiers are apt to be damp all the time and offer a favorable opportunity for the development of these destructive fungi.

Good Foundations Important.

This brings us to the foundations on which the lumber piles are built. In constructing foundations in lumber yards two features should not be overlooked. One is that the foundations must be built sufficiently strong to carry the load, and the other is that provision must be made for a free circulation of air in and around the foundations themselves and through the bottom of the piles of lumber. In constructing these foundations, it must be borne in mind that these fungi travel along the surface of the wood, so if a wooden foundation is employed, the timber used should be sound and free from decay and kept well above the ground so that it will remain dry. Combination foundations of concrete tiers and wood or concrete and old rails are very satisfactory. A sufficient number of cross skids should be provided so that each row of stickers rests on a solid base and so that provision is made for a row of stickers at the extreme ends of the pile. Usually the front foundations are higher than the back. This is to provide a slope to carry off the rain aind other moisture that may collect. The sticks should be placed not more than four feet apart for softwoods and as close as two feet for certain hardwoods which warp and twist freely.

Piling random-length material together in one pile, results in excessive warping from two causes. The over-hang of the longer boards, being unsupported, naturally drops down and dries in that position. The dropping of the outer end acts like a lever and causes a reverse bulge or curve between the first and second rows of stickers. This in turn might cause a reverse bulge between the second and third rows. Thus not only is the end of the piece dried out of shape but another section inside the first sticker is badly kinked. As far as practical, it is advisable to keep all lengths

How unevenly spaced stickers cause warping

together and pile them separately, making sure that a row of stickers supports each end.

Pile Should Have Forward Pitch.

In making the pile it should be given a forward pitch of at least 1 inch to each foot in heighth. This allows the rain and water, that would otherwise work into the pile, to drip directly to the ground. Careful spacing of the boards in each row is an important consideration. Unless sufficient space is provided, ventilation of the pile will be seriously retarded. Free ventilation tends to dry the lumber, remove any surplus moisture that may seep into the pile and eliminate the tendency to stain and discolor. For 1 in., 1¼ in. and 1½ in. lumber a space of not less than ¾ in. should be left between each board; for 2 in. and 2½ in. stock the space should be 2 in. and for thicker material resort should be made to 3 in. spacing.

The stickers themselves are worthy of attention. Some firms are very particular about the stickers used, while others seem to think that any old strips are good

Oak piled with stickers placed two feet back from ends of pile. Note end checks.

Note position of front stickers and total absence of end checks

enough. In the first place they should be of uniform thickness. This means surfaced. It is better to have them of uniform width, not less than 2 in. In length they should be slightly longer than the width of the pile. If the stickers are uneven in thickness, the pile will be high in one place and low in another, resulting in crooked stock.

The importance of placing the stickers in regular rows directly above each other should be too well known to need reiteration, yet how often does one see a pile where, due to carelessness—for it is nothing else—the stickers are placed anywhere but directly above each other. When this occurs, excessive warping is bound to result. This is plainly shown in some of the accompanying illustrations. To insure straight lumber, every attention must be given to the selection and

Warping due to the piling of uneven lengths of lumber together.

placing of the stickers. Not only must they be kept in line but each row should rest on a cross piece or skid. This was explained early in the article.

Preventing End Checking.

The stickers should be placed at the extreme ends of every pile. The advantages of this are threefold. They support the ends of the stock and prevent warping. If allowed to protrude slightly beyond the ends of the boards they shed the rain, help keep the pile dry and tend to prevent end-checking by retarding the rate at which the end wood dries out. The weight of the stickers and pile bearing directly on the ends of the lumber tends to prevent the stock contracting with the accompanying checks. Two of the photos shown illustrate how the placing of stickers at the ends of the lumber reduces end-checking. Under no circumstances should lumber be piled in the open without stickers of some kind being used.

In a yard where any considerable quantity of lumber is stored, the amount of material used for stickers runs into many thousands of feet. In view of this it is doubtful if the value of the stickers is fully realized. The writer knows of instances where the children, and even the employees themselves, think nothing of breaking up a few dozen pieces and carrying them home for fuel. In a yard where there are 40 or 50 piles there may be as high as 20,000 feet of lumber in the stickers themselves. There are some who place a true value on this seemingly unimportant item and as a consequence have constructed covered racks and even sheds where the stickers may be carefully stored when not in use. If left lying around on the ground they become warped, twisted and broken. If left long enough decay may set in. Thus the pile in which they are used may become affected.

All piles in storage should be covered in some way to protect the upper layers from the action of snow and rain and to shed as much water as possible. Lumber exposed directly to the weather quickly checks and warps and is thus often rendered practically useless. Loose boards of low value are often used for covering purposes. They are held for this purpose entirely and employed over and over again.

The spacing of stacks is also very important, as upon the clearance allowed between piles depends to a certain extent the circulation of air through the lumber. No less than 2 in. should be allowed between each pile and this space might well be increased if the area of the yard permits.

Protecting Ends of Hardwood.

Where heavy hardwood is being seasoned in the open it is advisable to protect the ends in some way either by nailing cleats or pieces of metal over the ends or by treating them with some moisture-resisting compound. Many feet of valuable stock will be saved if this is done. The ends may be treated with paint or one of the following formulas might well be used: Rossin, 60 parts; lamp black, 1 part. This should be applied hot. Another mixture can be made from whitewash, glue and salt.—1 quart of glue and 3 lbs. of salt to half a barrel of whitewash.

In conclusion, every week should be clean-up week in the lumber yard. As intimated, the fungi, which cause decay, spread rapidly so that pieces of decaying wood coming in contact with a pile of lumber might affect a large part of that pile and cause considerable loss. Wherever possible, the yard itself should be covered with a good layer of cinders, not ashes. Certain chemicals contained in cinders combine and produce sulphuric acid. This acid tends to kill all plant growth around the piles and in the yard, while on the other hand, ashes themselves tend to promote plant growth.

Every woodworker has so much money tied up in his lumber yard that he cannot afford to overlook any simple precaution that will tend to reduce loss and conserve the lumber purchased.

The Valley City Machine Works, Grand Rapids, Mich., manufacturers of this machine, will be glad to furnish further information on request.

The National Cooperage Co., Limited, Toronto, was recently incorporated to manufacture and deal in barrels and all kinds of cooperage; capital $1,000,000. W. F. Lickley and G. H. Bourne, both of Toronto, are two of the incorporators.

100 Woodworkers Discuss Motor Drive

Pointed Opinions by Operators of Woodworking Plants on Suitability of Electric Drive—Reasons For and Against—Has Won Large Number Supporters

"The electric drive has so many advantages that steam is unthought of and the consequent accumulation of shavings can be cared for by a Dutch oven and your power may be transmitted without costly belts and cumbersome line-shafts. Its cheapness is obvious from a glance at your cost per horse power."

"On account of the poor water we are obliged to use, we consider it advantageous to use electric drive, and besides it is a very true, steady power that we would not consider it to our gain to change to steam. The cost is approximately the same."

"No matter how heavy a load, there is no variation in the speed at which the machinery is driven by an electric motor, whereas with steam there is a slowing down when heavy machines are put on. Another advantage in favor of electricity is that one can always tell exactly what the power is going to cost."

"We find that the greatest advantage is in reducing the friction or in other words the lost power. In the woodworking plant alone we have reduced our friction from 45% to 15%."

"Advantage all in favor of electricity if supply is steady."

"Formerly we used a steam-driven 60 horse power boiler, 35 horse power engine, but now a 15 h.p. motor drives all our machines at full working speed, something we never could attain with steam."

"Prefer electric drive, cleaner, handy to operate and cheaper."

"Electric very much cheaper."

"Individual drive advantageous as one part can be shut off without interfering with other machines."

"Prefer electric for part, steam for part, as steam is necessary for kiln-drying purposes."

"I much prefer electric drive, providing we could obtain it at a flat rate."

Eliminates Transmission Lines

"The inefficiency of the lineshaft — countershaft style of drive has been recognized in recent years by a good many manufacturers on account of the great waste of power in transmission. In a well-equipped factory with lineshafts driven by belts, the loss of power in transmission and friction will be at least 25 per cent., and in plants not so well equipped, it will run as high as 40 per cent. of the power generated. This loss is practically all eliminated by using electric motors direct-connected to machines."

"For a woodworking plant where fuel is plentiful, we favor steam."

"Electric is alright. I feel, however, the rate is too high (50 h.p.)"

"The steam is a thing of the past where you can get the electric drive. You have no waste time or power. We find it suits our needs the best."

"Electric drive is very much cheaper."

"Prefer electric drive for economy and convenience. Disadvantage only when power is off."

"Electric drive more economical."

"The electric drive is far ahead, providing there are no shut-downs."

"Electricity more convenient, largely eliminating belting and enables one to place a machine in any position regardless of shafting. We generate our electrical energy for power and light with a "Hydro" connection, giving partial power and light for emergencies."

"Find electric cheaper than steam."

"Motor saves engineer's wages."

"Electric drive has nearly every advantage over steam drive."

"Electricity cheaper on account of high salaries for the engineer."

Safety Factor Considered

"We consider electric drive more economical and much safer, especially when wastage is taken care of and made of some commercial value."

"We consider electric power far in advance of steam for several reasons,—1st, not necessary for engineer; 2nd, No coal to buy; 3rd, No upkeep as compared with engine."

"I like electricity because it is always ready and is cheaper than steam for my factory."

"We use a few motors intermittently for convenience; have not power enough for continuous service; use steam principally made from refuse."

"Favor the electric drive. There is no waste power and a small plant does not require a night watchman."

"On account of coal being so high in price and other fuel also expensive, the saving in a motor drive is considerable. The saving of a man's time looking after the engine and a saving of oil as motor will consume only a small amount to what an engine will."

"We find electric drive superior."

"Saves engineer's wages. No trouble with water-pipes freezing."

"We wouldn't go back to steam power on a bet."

"We find the electric drive more economical for isolated drives and for our machine shop which is often required when the engine is shut down. The method of charging a minimum rate per h.p. installed by the Hydro, practically prevents individual motor system of installation for plants such as ours."

"As we produce enough fuel (shavings) to develop to capacity in steam on present installed power, we, of course, find it more economical to use steam. The addition of electricity is to take

care of special moulding department. For us, steam most reliable."

"Electricity the only power."

Generates Own Current

"We find it much handier using the motor drive instead of steam drive, there being no power wasted so to speak. When a man is through with a machine he shuts his motor off and there is no idle transmission running to eat up power. It has done away with practically all overhead belting, etc. We find it cheaper to generate our own power as we have to have the steam anyway for heating and for our dry kilns. We purchase a little power but not of any account. We even use our own lights but have it arranged so that we can switch in Hydro lighting service after hours when our generator isn't running. All around, we believe it to be more satisfactory and more economical than steam."

"Much handier and cheaper and always ready."

"We find the electricity much cheaper and handier to operate than steam."

"We strongly say 'Electric' after many years' experience with it."

"Electric power is cheaper and steadier, and reduces fire risk."

"The disadvantage of electric drive is getting rid of refuse."

"Electric much the best."

"Electric motor has advantage over steam in part of our plant where used on account of saving in fuel and labor, but would not be an advantage in other parts of plant as when steam power is generated, it makes its own fuel."

"Electric power economical if used 24 hours. In our particular case all exhaust steam is utilized."

"Electric is preferable but steam is used to burn up refuse, etc."

"Advantages are all in favor of electric drive."

"No comparison whatever. Hydro power is the only power going as to cost and service."

During last four years has been much more satisfactory as well as economical."

"Electric drive is good when motion is constant but for sawing where load is on and off, steam is better."

Frozen Pipes Thing of Past

"No fire menace, no trouble with water-pipes freezing in cold weather and less labor and trouble with electric drive. Only disadvantage is that it provides no way of disposing of sawdust and planer shavings which would be used as fuel with steam drive. Of course a burner would take care of this."

"Electricity cheaper. More convenient, fewer interruptions."

"We have only recently discontinued steam drive and have installed electric. We find a much more steady drive, also more power."

"Motor drive on grouped machines requiring power only for machines actively in use saves on transmission line and whole plant is less liable to shut down on account of breakage. Would have to find other means for disposing of shavings, etc., which are now burned."

"No comparison, labor and fuel, nil."

"Would not return to steam under any consideration."

"Electric drive is much more advantageous and cheaper than steam at the present time."

"No comparison."

Loads Motor to Capacity

"Electric best and cheapest if you run your motor pretty near to its full capacity. We are using about 28 h.p. out of our 30 h.p. motor."

"During warm season hydro is the cheaper. In winter we might use engine cheaper, using live steam for power and exhaust for heating, drying, etc. Hydro is, certainly, more convenient and on the whole is the best power."

"Group motors or individual, is the very best for woodworking plants, where special furniture is manufactured. Steam must, of course, also be had for kiln and glue-room heating, etc."

"Advantages of electric drive: more even, less danger of fire, saves labor of one or two men."

"It is cheaper and always ready."

"Electric drives are more direct, more flexible but in considering removing waste, kiln drying and heating we save money on our steam plant."

"Would not consider steam at all."

"No experience as yet but think we could cut down power bill some, even having to provide steam for kilns, heating presses, etc."

"Electric drive suits my machinery better than steam, as it is all light high speed machinery and is, I think, less expensive."

As a Part Time Power

We have contracted with the Hydro for eight months in the year commencing April 1st, to November 30th. The balance, four months, we go back to steam. The reason is this,—we have got to have steam to heat our plant. We expect to have enough offal to run our steam plant till February 1st. This will mean we only need to buy soft coal for the remaining two months, whereas we were buying and burning coal all the time for 12 months in the year."

"The electric drive the only one. We would not use steam power even if coal could be obtained at $5.00."

"Small users electric is best. More convenient."

"Advantages of electric drive—economy of power. We have occasion, under present conditions, to run our auxiliary steam engine for one or two machines, which, under electric power, could be avoided."

"Electric drive much better in every way."

"We strongly say 'Electric' after many years' experience with it."

"Much cheaper and more convenient than steam."

Eliminates Fuel Problem

"I consider electric drive a great advantage owing to the ease with which it may be started.

Also there is no trouble in obtaining fuel, which is necessary in any other form of power."

"We have given the electric trial for one year. Although we have not as yet come to any conclusions, facts seem to point towards steam being the most efficient when as in our case we can use the exhaust steam from the engine to heat our kilns and factory." (165 h.p.)

"We like the electric drive, but service charge for large motor seems quite high, $40 per month if motor is not used, about $32 if motor is used. We use water-power to assist motor when there is a supply of water available."

"We believe the electric power is best and cheapest but as we make large quantities of refuse, we are compelled to use steam. We also need it for kiln-drying and heating the factory."

"Electric has many advantages, but not sure yet that it does not cost more than steam for a woodworking plant in winter work. In summer there should be some saving."

Cheaper Than Steam

"We use the motor on our double shavings fan only, which requires 20 h.p. indicated and which costs us about $18.00 to $19.00 per h.p. per year. Our cost of steam power is much greater, at least $50.00 per h.p., but a certain amount of steam is required for other uses in the factory."

"We find electrically-driven more advantageous in every way. Has cut our power and heating cost 42 per cent. since 1917."

"Electric power cheaper and more efficient. Only use steam to use up wood refuse and make enough exhaust steam for heating dry kilns and building."

"We prefer electric power. It is so handy."

"Owing to fuel being high, the difference in the cost of Hydro and steam we believe would pay for installing Hydro, in two years."

"Much cheaper than steam, notwithstanding we used shavings for fuel, which cost us nothing. Although we are charged $1.00 per h.p., it does not cost us that. We pay what meter shows. Can stop or start when we choose. No power used, no charge, except the base charge 12.5 per h.p. Very satisfactory."

"Very much better and cheaper."

"We find electric drive much cheaper and convenient."

Few Disadvantages

"Altogether in favor of electric drive."

"At the present price of coal, electric power is cheaper but is very unsatisfactory due to the endless shut-downs ranging from 5 minutes to ¾ hour."

"There is a great advantage in electric drive. It is a money-saving power."

"Have never used steam drive. Electric pow-

"Electric drive does not require a man in constant attendance as does steam. Starting is instantaneous and does not require an expert. Any one of the workmen can throw in the switch and get the line-shaft under way. To our way of thinking it has all the advantages and no disadvantages compared to steam."

er always ready. Needs very little attention. It is cheap."

"Electric drive much more convenient than steam."

"About two-thirds cheaper than gasoline power. Never used steam."

No Time Lost Getting Up Steam

"We find that steam is not in it with electric drive. No engineer. Start and stop any time. No waiting for steam to get up, and our experience is that there is less stops with the motor for repairs than an engine."

"Disadvantage you have to pay whether you use any current or not. Our plant only runs part time."

"We find in our business the electric power is far ahead of the steam, as the power is there at all times. Anyone can start or stop. No need of keeping a man and again there is not the danger of fire. We might say we would not change back to steam under any circumstances."

"The cost is less than we paid our fireman under steam. Great convenience for a woodworking plant which may not be running steady in slack season. (40 h.p.)"

"I consider the electric drive the best. We use it at our sawmill but we cannot use it in our factory as we are situated in a small village and cannot get refuse disposed of unless shipped. The freight prohibits that. A motor to each machine is the proper application.

Unusually Low Upkeep

"Would say with electric power available and the rate that is charged here and the service we are enjoying, we would not consider steam at all as electricity is by far cheaper to operate. The expense of upkeep is nothing compared to steam. The cost of operating in our plant is less than fireman's wages. (35 h.p.)"

"Cleanest, cheapest and handiest."

"As long as dry kilns using steam are necessary, we believe it will be to our advantage to use steam power largely and use the exhaust for heating."

"We consider the electric drive more economical, especially when the shavings and sawdust can be disposed of to advantage. It is also not as hazardous regarding fire."

"We prefer electric and save practically 200% operating expenses. (150 h.p.)"

"Much more economical, as it saves an engineer's wages, etc."

"Would not consider steam drive. Electric drive much more economical and by far the most efficient and satisfactory."

"Less labor, no fuel, cheaper."

"We get sufficient refuse to make the necessary steam, and as steam is required for heating shop and dry kilns and we use exhaust for this, would not change steam for hydro in our line."

"No comparison to steam drive. No coal, no man to throw coal under a boiler."

Plans for an Eight-Room Residence

Designed by P. H. Finney, Architect, Toronto

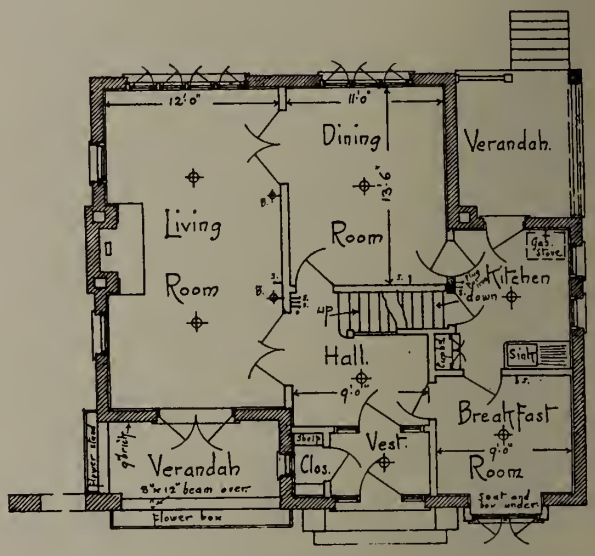
THE accompanying floor plans and elevation are of an eight-room house under construction at the present time in the Beach district, Toronto. The house is built on the square plan, red tapestry brick being used in the construction of the walls to the second floor, with stucco on frame above. The exterior appearance of the house is very attractive, the simple square plan being broken by the sloping roof, as shown in the elevation, which projects out at the corner of the house, forming a hood over the side entrance way, yet the ultimate floor space is maintained. The wood casement windows also add greatly to the beauty of the exterior. The house is roofed with wooden

Front elevation.

shingles, stained dark green. There is a small square verandah at the back entrance, with a balcony above, entering on the sun room on the second floor.

There is a basement under the entire ground floor, which contains a large billiard room, separated from the rest of the basement by a 9-inch brick wall, with an entrance opposite the stairs. This room is located just under the living room, shown on the first floor plan, and is exactly the same size. Entrance can also be gained from the outside, at the rear of the house. There is ample accommodation also, for heating equipment, coal bins, laundry tubs, etc.

A feature of the main floor plan is the easy access which can be had to any of the rooms from the square hall. This floor contains a large living room, 22 ft. x 12 ft., dining room, kitchen and breakfast room, oak floors, and trim being



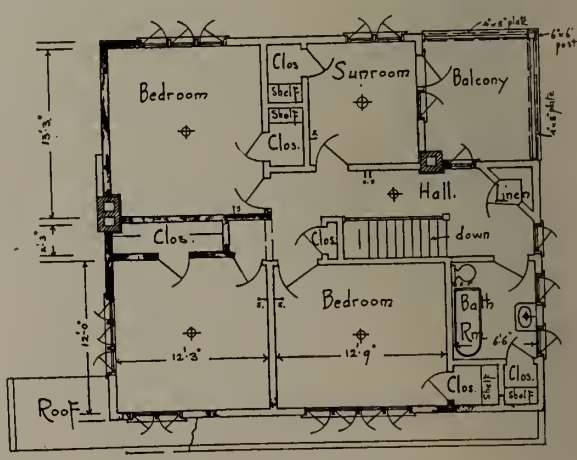
Ground floor plan.

used throughout, with the exception of the kitchen.

In this particular case, only a small kitchen was required, but it will be readily seen that the kitchen space could be very easily enlarged, if necessary, by taking in some of the roomy porch at the back.

The three bedrooms and sun room on the second floor are laid with hardwood floors and trimmed with Georgia pine. Tile will be used in the flooring of the bath room. As will be seen on the plans, the bed rooms are all large, well arranged and well lighted. The house is steam-heated.

Mr. P. H. Finney, 79 Adelaide St. E., Toronto, was the architect.



First floor plan.

To Distribute Burden in Good and Bad Times

Normal Overhead Best Basis for Figuring Costs--Does not Penalize Business when Production is Low—Each Year Dependent on Others

By E. W. McCulloch.

In the article "What a Cost System Should Do for You," which appeared in the May "Canadian Woodworker," we called a good system an insurer of profits. Some may question this statement in times of depression when they find their unit costs rising 100% or more, largely because of the increasing overhead on their low or sub-normal production. Let us examine the situation by calling to mind those facts and fundamentals with which we are familiar.

A manufacturing enterprise in its simplest terms consists of:—

(a) A place to work,
(b) Machines to work with,
(c) Men to do the work,
(d) Material to work upon,
(e) And management to co-ordinate the whole.

Let us see what all this means. A place to work requires maintenance. It must be repaired and cleaned, heated and lighted and watched. A place to work bears taxes, rent and insurance and it also depreciates. Machines consume power and supplies, require insurance, attendance, repairs and cleaning and also depreciates. Men to do the work entail wages, liability insurance and supervision. Materials include provision for receiving, sorting, handling and shipping. Delivery of material alone may demand a heavy investment in trucks and garage, teams, waggons, and stable, forming, in fact, a compact separate miniature organization. Management takes care of the buying, selling, financing and administration, purchasing agents, salesmen, accountants, stenographers, stationery, postage, telephones, legal expenses, engineering, advertising, travelling, and so right down the line of what are known as general or commercial overhead expenses. Such is your manufacturing enterprise in crude outline. Elaborate it, departmentalize, unify and combine it, as suits your own requirements.

The Activities Involved

That which gives life and vitality to your manufacturing enterprise is work,—something to do. It stirs the slumbering organism into action, starts the wheels a-grinding, the chimneys to smoking. How much work you can turn out,—what are the latent possibilities of your organization, — that is not often shown or demonstrated. Ordinarily your plant is idle sixteen hours out of twenty-four, and a day and one-half out of seven. Only in a great national crisis or emergency such as the recent war do we really speed up production and extract from our facilities the last ounce of usefulness. Otherwise we strike a steady normal gait of healthy activity below the limit of what we can do, above the limit of slacking or lagging. This normal, this mean or middle ground of possible capacity, is an ever-present fact in industry. It is there and should be recognized as a starting point in the discussion and treatment of industrial problems such as costs. Normal capacity is your 100 deg. mark, above which your organization registers in times of excessive or unusual activity, below which it drops in times of curtailed production and demand.

Operations Cease, But Do Expenses

The even flow of work is subject to many interruptions. There are strikes and transportation tie-ups, machinery breakdowns, seasonable fluctuations, as in the ice business, and years of light demand, such as we are at present experiencing. What happens when there is no work or little work? Do the expenses incident to running a business cease or recede accordingly? Your building still carries its taxes, rent and insurance, and needs about the same degree of repairing, heat, light and watching, and meanwhile it depreciates. Likewise your equipment continues to depreciate and requires insurance and some maintenance. Theoretically you can discharge your men, but practically you find odds and ends of work, non-productive tasks, for the best of them, and of course you retain your superintendents and many of the foremen. You stop feeding the machines materials, but your money is still tied up, and the material deteriorates, and must be insured, properly stored and cared for. When it comes to the management, you cannot sacrifice your executives, your office, your best salesmen, your best engineers, accountants or clerks. Such are the considerable expenses incident to not doing business; expenses which go on for a considerable time whether or not you are doing a dollar's worth of business or work, expenses that must go on if the organization is to remain intact.

Who Pays the Bill?

Since such interruptions of industry are still an ordinary incident of business, and carry a cost that must be reckoned, the business man hopes the consumer will pay for them. "I am offering a service to the community," he says. "If for considerable portions of time my facilities are unutilized, my plant and equipment idle, or marking time, I must include in my price an allowance for this item of suspended operation (inoperative contingencies the paper industry calls it); otherwise I cannot exist." Where facilities are based and attuned to the needs of the market, and are not a war-time mushroom growth, the demand of the business man does not appear unreasonable. The trouble very often is that his cost system does not show him how he can recoup such losses.

When the very considerable expenses of not doing business are applied in full to a reduced activity, very high costs result,—costs out of all relation to the true costs of production, and costs bearing no relation to what the market will bring. In such time two opposite tendencies develop. On the one hand the business man who is a firm believer in his cost system refuses to take business except on a basis of his inflated costs and thereby further restricts business at a time when the crying need is for more and not less business. The

*Manager, Fabrication Production Department, Chamber of Commerce of the United States.

more skeptical business man feels there is something wrong with his cost system, proceeds to ignore it and sells his product for whatever he can get. This treatment of the cost system is more largely responsible for demoralized markets and prices than is realized. Meanwhile the plant is bearing the full brunt of slackened activity.

Normal Year the Standard

Our cost systems are far too rigid. Under cost methods still largely in use overhead expenses are spread too thin in times of forced production and, massed too heavily in periods of slight demand and production, giving in the former case costs that are artificially low and unfair to the management, and in the latter case costs that are artificially high and unfair to the public, and moreover costs which the market will not sustain.

For the sake of convenience, we split up our business into years and treat each year as though it were separate, distinct and unrelated, whereas no such sharp cleavage exists. Year merges and glides into year, one dependent upon and connected with the other. The injustice and inaccuracy of a complete and abrupt cut-off is clearly illustrated by an income tax law which heavily taxes the profit of one year, and makes no compensating allowances for the losses of the following or preceding year's operations.

Cost systems should recognize this continuity of time wherein any single year or month may or may not typify and represent normal production and demand. There are expenses, it has been shown, which continue whether the plant is idle or in operation, expenses that moreover, bear no direct relation to output. Cost systems should provide that these expenses, usually designated as overhead expenses, should be absorbed and pro-rated on the basis of a normal year, —that 100 deg. mark on the business thermometer. Thus, in time of unusual production,—production exceeding normal,—the overhead should be more than used up in costs, and a surplus out of overhead cost created to take care of those years when the output is below normal and the overhead charges not fully absorbed in the costs of that year.

To take a very simple illustration: Let us assume the normal output of a department is 100 pieces and the overhead $100, or an overhead charge of $1 per item. If the department produces 150 pieces at a normal overhead charge of $1 per item, not only will the $100 overhead be used up but there will be an additional $50 as a reserve accruing to the management. When the output of the department drops to 50 pieces, only $50 overhead will be applied to this reduced production, and the difference made up from the reserve established during unusual production. This method of cost procedure has numerous advantages, two of which it is here appropriate to mention.

1. It will assure the business man a reward for his efforts in speeding-up.
2. It will eliminate the needless throttling of business by the impractical attempt to load semi-normal production with greater charges than can or should be borne.

Operation Under Normal Year Basis

The determining of a normal year is not an easy matter. It requires a long look behind and a far look ahead. It is by no means sufficient to accept the operations of the preceding year as the sole standard. The normal year is different for a new organization or industry from what it is for one long established. The normal year does not remain on a dead level but should probably curve upward gradually and conservatively with the growth of population and markets. To do otherwise would indicate industrial stagnation.

To establish normal unit overhead charges, two things must be determined:—

1. Normal overhead expenses for the various departments of the business.
2. Normal production.

When the normal overhead expenses are divided by the normal production, the result is the normal unit overhead charge.

In determining normal overhead expenses, those expenses of the previous years which are accidental should be eliminated. An effort must also be made reasonably to anticipate and allow for the trend of expenses for the coming year.

But there is nothing conclusive, final or binding about this estimate of normal expenses. Each month your cost system gives the estimated overhead expenses and the actual expenses. If there is an increase of the actual over the estimated, and upon analysis that increase is found to be a real increase, due to unanticipated increase of salaries or insurance rates, etc., and not an inflation arising from reduced production, an adjustment upward can immediately be made in the unit overhead charges. Each concern will establish for itself a safety zone, below or above which decreases or increases in real costs will be reflected and taken up in the selling price.

In determining normal production due allowance must be made for interruptions of operation. Even in the job industries, which by necessity have been schooled to base overhead charges on a normal year, the tendency is still to base capacity on regularly operated machines. When these machines do not regularly operate, it is apt to go hard with the establishment. In a paper mill with a possible yearly operating time of 7,488 hours, the plant was idle 689 hours or not quite 10% of the time, because of the usual and customary interruptions, repairs and high water. How transportation tie-ups, strikes, and slackened demand in many industries affect production is, of course, familiar to all. In determining normal production, then do not delude yourself by placing it too high,—at a mark reached only in exceptionally fortunate years.

Necessary Cost System Adjustments

Though cost accountants and industrial engineers are prone to using strange and technical terms for it, the accounting device used to secure operation on a basis of a normal year is the now familiar one of the Reserve, or a modification thereof.

For purposes of illustration, let us recall how a simple reserve, such as the reserve for bad debts, operates. The operating account "bad debts" is debited each month with the estimated amount of bad debts likely to be sustained, and the account "Reserve for bad debts" credited each month with a like amount. As bad debts are actually sustained, the amount thereof is debited to the Reserve for Bad Debts. It is very easy to ascertain for income tax purposes the amount of bad debts actually sustained during the year by referring to the debit side of the Reserve for Bad Debts, and ascertaining the estimated allowance for bad debt by referring to the credit side of the Reserve for Bad Debts.

So the estimated normal overhead expenses will be charged into costs upon the particular cost method

employed (man-hours, machine-hours, productive labor, etc.,) and likewise overhead expense will be debited to the particular expense accounts, and closed out periodically to the Reserve for Overhead. Accordingly, the debit side of the Reserve for Overhead will give the actual expense totals, and the credit side the estimated expense. It is assumed such a reserve for overhead will be sub-divided in accordance with departmental requirements, and where convenient the expenses will be scheduled.

The preceding has, moreover, left out of consideration refinements recommended by cost accountants of the principle of the Overhead Reserve, such as Under- and Over-earned Overhead or Burden, Overhead or Burden Variance, Supplemental Rates, etc. These do not disturb the essential principles set forth and are apt to confuse a simple presentation of them.

Some Misunderstandings Clarified

Certain misunderstandings arise concerning the distribution of overhead expenses on the basis of normal year which should be mentioned and disposed of.

1. The setting up of estimated overhead charges based on a normal year does not mean the abandonment or compromising of actual overhead costs.

The actual expense exists alongside of the estimated and one is compared with the other differences analyzed and accounted for. To an executive such an analysis reveals the story:

(a) Of inefficiencies that must be eliminated;

(b) Of advances or decreases in costs not anticipated;

(c) Of costs artificially low or high because of sub- or abnormal production.

A cost system is built for service, not admiration, and must furnish information that will guide and temper the entire policies of an enterprise. At a time when more and not less business is needed, a cost system that literally interpreted, instructs an executive to refuse business except on prohibitively high and inflated costs of production, falls down when most needed. Such a system, though arithmetically correct, presents results that are misleading and which may work serious injury. Accordingly, the actual overhead charges are checked, corrected, supplemented and eased by the estimate of expenses based on the normal year.

2. It is not the intention to forego or wipe out a single dollar of overhead expense that can be legitimately and fairly charged to operation, sales or administration.

That the management should bear the expense of sub-normal production is a point that has been stressed altogether too exclusively. Meanwhile not sufficient emphasis is given to the converse; namely, that the management should be rewarded for abnormal production. One is as fair as the other.

The balance in the Reserve for Bad Debts is not customarily closed out to Profit and Loss at the end of the year, but carried forward into the next year's operations, since any one year may or may not be typical of the bad debts normally sustained. So likewise the production of any one year may or may not be normal, and the balance of the Reserve for Overhead, be it debit or credit, should accordingly be carried forward. If the estimate of normal capacity is reasonably low and cautious, such overhead expenses as have not been absorbed in one year will be absorbed and the losses recouped in the years of exceptional production, for in the long run the depth of the depressions will very nearly equal the height of the peaks.

Found Feasible in Practice

What has been stated is elementary and suggestive. Its aim is to stimulate interest and encourage such changes as are necessary to meet progressive competition. The subject has been brewing for some time. It is referred to in the pamphlet of the Federal Trade Commission, "Fundamentals of a Cost System for Manufacturers," published in 1916, and to its development numerous well-known cost accountants and engineers have contributed. Upon inquiry of the Fabricated Production Department, establishments in such widely separated industries as paper, cutlery, envelopes, stoves, and metal products are operating on the basis of a normal year and upon this basis distributing overhead.

It will be useful to quote from the practice of one producer:—

"Our whole cost scheme consists in the first place, of a budget, made up the first of each year, for every department, machine and production centre. This budget must naturally be based upon past experience plus an intelligent estimate of the possibilities for the year. The hours of operation, or the production units are arrived at by taking an assumed 80% of possible operating time as a basis. In all these industries the standard week consists of forty-eight hours, or an eight-hour day. Deducting Sundays and holidays we assume that the year consists of three hundred working days of eight hours each, or 2,400 hours. We take 80% of this, or 1,920 hours, as our normal unit. This figure used in connection with our budget of expense and operation gives us our normal rate.

"We use this normal rate at all times in figuring both estimates and costs. Last year most manufacturers operated more than this normal, with a result that their actual costs were less than the normal cost, and this gain was taken as a sundry profit.

"At the present time the costs are running considerably higher than the normal, and for some time at least we must absorb this loss, maintaining at the same time a standard normal rate, but not subject to the violent fluctuations brought about by any increases or decreases in the volume of business handled."

But the number and percentage of establishments so operating is indeed inconsiderable and to many the mere idea of distributing overhead on a basis of a normal year is novel and daring.

Normal Most Satisfactory Basis

The treatment of overhead in the way indicated is not a panacea for all our industrial ills. The control of overhead in a manner fair to the business man as well as the consumer is one step and only one step toward realizing more stable prices and eliminating those wild fluctuations that culminate in industrial depressions. Such a consideration also points out this moral, —that the hope of permanent reduction of costs rests only in the greater, more continuous and more regular use and operation of our industrial facilities.

Thousands of firms went through the recent years of full-blast operation upon a basis of overhead distribution essentially unfair to them. A start in the right direction must be made, and upon such firms is urged the consideration of adjusting overhead charges on the basis of a normal year, and it is so suggested, both as an advance in sound cost accounting and as a measure to facilitate that business revival we all desire, need and anticipate.

Electricity in the Sash and Door Plant

Full Advantage of Straight-line, Mass Production—Operate Special Fabricated House Department—Specially Designed Equipment

By Geo. S. Perry
Vancouver Representative

Mass production, like cost accounting, appendicitis, and many other more or less highsounding modern expressions, is not so new as it seems. We always had these things. Mass production is nowhere so strikingly exemplified as in a modern sash and door factory, where a machine is set to cut a single piece, whether rail, or panel, or header, and it is fed with lumber of the size cut to suit, until possibly several thousand of the one piece are turned out all ready to be assembled with other parts into a door, window, or whatever standard item of stock it is intended for. One of the best places to see this carried out is in the model electrically driven plant of the Hanbury mill on False Creek, Vancouver, B.C. This sash and door factory, which is but one department of the big sawmill concern operated by the veteran western lumber manufacturer, John Hanbury, is apt to be overlooked when looking over such an extensive plant. It is, however, well worth a special visit in itself.

Straight Line Production.

To begin with, the plant is entirely operated by electricity, and practically every machine has an individual motor. There is perhaps an exception. In one part of the shop three motors drive three distinct units of the plant. These are the door machine, with chain morticer and sticker; the sash unit, with its tenon machine and sticker, and the panel raiser, goring and relishing machine, and shaper.

In the arrangement of the plant the idea has been to keep the stock moving steadily in one direction, and that the shortest, from the receiving point until the finished parts are piled in the storage racks or carried on factory trucks to the assembling machines. The general routing of the material is to the right from the moment it enters the factory at point of delivery. The lumber stock, in standard sizes, passes two cut off saws and one rip saw, sizing the stock in the rough, as to width and length. Two double-head tenoning machines take each stick and both ends are shaped at once. The stock for doors then goes to the door machine, with its chain morticer and the sticker which shapes each rail. There are many door specifications still requiring the raised panel, for certain classes of trade, and for that purpose the panel raiser and shaper is used. The assembling of the doors is done in a power door clamp, which handles all sizes of doors rapidly and efficiently.

Clean and Orderly.

The sash unit has a foot power clamp, also an arm sander for special sizes of sash. The open stock, after being put together, passes to the right to the glazing department, and thence direct to the shipping room for crating. A three drum sander is used for all stock, whether for shipment or to go into storage. Window and door frames are built on bill, and stock is carried ready for cutting. A New Britain dado machine cuts both the straight and bevel gains at the same time. A special sliding saw is used as a cut off and another small saw is rigged to make the cuts for the recess in the frame.

A visitor is at once struck by the extreme cleanliness of the plant, and the absence of all litter or dust. A very complete blower system connects with every machine, and powerful fans carry off all dust and shavings to the burners which are installed at the sawmill, at quite a distance from the sash and door plant. Power for the entire plant is generated by the steam plant of the mill, and an emergency line connected with the B. C. Electric system is also kept up. Steam coils are installed for heating the factory in winter, and the steam for these is also from the saw-mill boilers. This model electric plant has a daily capacity of approximately 100 to 125 doors, and about the same number of pairs of stock sash, depending on size and specifications. The main floor of the factory is 72 x 120 feet in area, and in addition to this, the shipping and storage floor for made up stock is about half that size.

Ready-Cut House Department.

Another interesting adjunct of the sash and door plant, which is housed in adjoining space, is a cut-to-fit house department, where all lumber is assembled and cut, bundled and marked in accordance with minute instructions from the companies specializing in these buildings. Sections of studding, shiplap, siding, etc., down to a fraction of an inch are trimmed. Every rafter is cut and notched, and in this connection a very clever rig has been devised by Mr. A. Pengelly, the superintendent of the sash and door plant. He has rigged a cut-off saw on a swinging arm, suspended from a circular overhead wooden table, which rotates on flat surfaced rollers. The motor operating the saw is also suspended from this overhead table, so that it moves freely with the saw arm. By this device any angle can be cut on a rafter, and to cup hip rafters with their compound angle, Mr. Pengelly has a special table in which he can set the rafter on the angle, as well as turning the saw to the other angle. Another table is used to raise the rafter being cut, to the centre of the saw, for cutting the notches without cutting through. The table being set at the right distance, the saw cannot reach beyond the marked depth.

Increased Efficiency on Dovetailer

One of the dovetailing machines in Showers Brothers factory at Bloomington, Ind., gave the operator considerable trouble through burned out bearings. It seems that the babbit would burn out once or twice each week. The workman decided to overcome this trouble, so they substituted bronze for the babbit. After three weeks without trouble they decided that the cure had been found.

Anather loss on this same machine occurred in the use of leather belts, which had an average life of five weeks. Pigskin belts were substituted for the leather, and after four months' use seem to be in perfect condition.

With these changes the machine's speed was increased 1,300 revolutions per minute. This resulted in an increase of several hundred drawer fronts and ends each day—a real tribute to the men who planned the changes.

Problems in Standardization of Dimension

Accuracy in Manufacture and Grading Prime Requirement—Specialize in Certain Lines—Accept Attitude of User.

By Wm. A. Babbitt, Chairman Standardization Committee.

One might easily and safely hazard the opinion that the lumberman who is not willing to take the time and trougle to get the woodusers' point of view had better stay out of the dimension program altogether. In fact, the writer believes that in no other way can a lumberman get a proper sense of the importance of small things in present day lumbering more easily and accurately than to look at his business from a woodusers' standpoint. The wooduser is daily brought face to face with these "small things" in lumber. He knows how tremendously they affect his whole production problem. These "small things" the lumberman is apt to overlook, but the wooduser cannot do so.

We will assume, for the sake of illustration, that a lumberman has gone into the production of dimension for some large manufacturer of turned wood products. This customer wants his stock sawed in steps of one-eighth of an inch, throughout a certain range of sizes. Such a specification might strike a lumberman as unreasonable, especially if his customer should refuse oversize squares. Let us say that the customer wants 1 in. by 1 in. squares, while the lumberman ony has 1⅛ in. by 1⅛ squares. Why be fussy about so small a matter as ⅛ in. oversize?

Waste More Than Seems

But the customer is not unreasonable, and he can easily show the reasonableness of his position. Did you ever figure the difference in volume between an 1 in. x 1 in. square and a square that is ⅛ in. larger? Probably not. But the manufacturer of turned wood products knows—or ought to know—that if a certain job requires five thousand feet b.m. of 1 in. x 1 in. squares, he will have to pay for 6,250 feet, providing he listens to the lumberman who wants him to buy for this job, squares only one-eighth of an inch oversize. 1,250 feet of this stock will be thrown into shavings, at an extra cost of $125.00 for material plus the cost of manufacturing that 1,300 feet of lumber into shavings plus the cost of slowed production, due to the excessive turn-off, on account of unnecessary oversize. This ⅛ in. oversize square is 25% larger than the required square. It would be very conservative to state that this ⅛ in oversize. in this case, would add at least 50% to the cost of raw material for the job. The point is that the woodusers' attitude is not always stupid or unreasonable. Sometimes there is a very valuable grain of sense and gleam of intelligence therein.

Glimpse at Other Side

The reverse side is naturally the lumbermen's side. Let us suppose the lumbermen had said to his customer: "I haven't the one-inch squares, but I will give you the inch and one-eighth at the same price, as there is very little difference." The customer accepts. How does the lumberman come out? He sells his inch and one-eighth squares at a discount of

Illustrating a lot of so-called "squares"

over 20%, assuming that he was selling both sizes on a per M base.

Further, this illustration sheds new light on the importance of proper equipment for sawing. The writer's somewhat extensive observation would tend to confirm the opinion frequently expressed that most dimension outfits are equipped with saws that produce one-inch squares from stock which with proper saws would produce inch and one-eighth squares. In which case, 200 board feet or more, are converted into sawdust, for every thousand feet of merchantable dimension stock produced, board feet which ought to be sold for real money. On an average dimension mill run of 7,500 ft. a day, some 1,500 feet of merchantable stock daily "goes up the flue." The point is that the question of saw kerf is much more important in manufacturing dimension stock than in manufacturing plank. It is as many times more important, as the average number of rippings per board. Could there be any school of economy for lumbermen, more suggestive and profitable than to operate a dimension mill with persistent and intelligent reference to saw kerf and net footage in terms of dimension stock?

The writer has ventured to extend his illustration to this great length in order to bring home the vital point that it is all important for lumbermen to see this dimension problem from the view point of their customer. Furthermore, we wish to make plain that there is no step in the dimension programme which is not characterized by similar mutual advantages.

Should Specialize in Certain Items

It would be a big undertaking for one mill to cover the standard specifications for, let us say, farm waggons. Very few mills could safely undertake to stock the line of specifications which have been submitted by the National Association of Wood Turners. Careful students see little chance for the mill who attempts to cover the whole field. It would seem to be folly for any mill to attempt to cover a tenth part of the furniture manufacturers' requirements.

So this programme of standardization evidently requires a lumberman to approach the production problem with reference to a particular field, rather than in a general way. In a word, he will be under necessity to decide, not to manufacture dimension stock; but to manufacture certain lines that careful surveys show (1) to be easily and reliably marketable; and (2) which interlock, so as to use up all stock available for dimension to the best advantage. Furthermore (3) he will install machinery with special reference to his specialized lines.

Accept Viewpoint of User

If it is safe to say that the lumberman who is unable or unwilling to approach the standardization problem from the wood user's point of view, had better stay out altogether; it is equally safe to say that he also had better stay out unless he is prepared and determined to dismiss a number of long settled and totally mistaken ideas about dimension stock. It will make all the difference in the world whether the lumberman looks down on, or looks up to this programme. We've got to respect our job.

Some of these fundamental opinions which are quite mistaken:—

1. That dimension stock is a low grade proposition. It will be essential to success to root out this idea, though frequently it will require a mental stump-puller to turn the trick. This operation would kill some of us.

But the truth is that dimension stock stands out as the sole high grade proposition. Dimension stock is lumber refined to its highest utility and greatest economy. Dimension stock is lumber with the destructive wastes eliminated. Most dimension stock grades higher than any commercial grade, especially in hardwoods. It is true that the great bulk of all dimension can be manufactured out of low grade lumber, but the dimension itself is ordinarily top grades.

2. That dimension stock is a low grade manufacturing proposition. This mistaken belief is so firmly fixed in the minds of the production staff that, in many cases, mental stump-pullers will be useless. Nothing short of a funeral, or a flock of funerals, will correct this evil. We are in possession of all the necessary data to prove that the chief reason why most attempts heretofore to salvage the obvious wastes of lumber operations by manufacturing dimension stock have failed is because the producer did not realize that the manufacture of dimension stock is a much higher and more difficult production problem than sawing logs.

Wide Variation in Sizes

In order to get this matter vividly before you, we are submitting a photograph of a lot of squares. These were manufactured by a concern that stands second to no other, as producers of accurately manufactured lumber. I know of no mill with better mechanical equipment. Yet study this picture. Can you find a single square in the lot? If you do, most likely the other end would prove to be some other shape. The writer has had most unusual opportunity to investigate this phase of the question, and he wishes the reader to understand that this picture does not represent an unusual case.

3. The third mistaken idea is that the curing of dimension stock involves the same factors and methods as curing plank lumber. In this connection, it is to be said that the Association of Wood Using Industries has secured the assignment of a specialist from the Forest Products Laboratories to give this problem the same attention that has marked their handling of the problem of kiln drying lumber.

4. The fourth mistaken idea is that the problem of properly handling and grading dimension stock is not a basic condition of success. Nor is this a simple problem. One of the main tasks in the programme of standardization is to determine how this stock can be handled economically on grades. Many a permanent customer for dimension has been killed off by receiving a car in which grades, sizes and kinds were dumped, in one chaotic jumble.

Three Indispensable Requirements

Standardized dimension stock requires the manufacturer to put new meaning into the word "accuracy." The production penalties against inaccurately sawed dimension stock are very much greater than those which apply to mis-sawn lumber. In most cases, mis-sawn dimension has little or no salvage value. Over-size, not infrequently, will be found an objection of considerable importance to the wooduser. It is always a serious loss to the producer.

Years ago, when the new standards of accuracy were coming into vogue, an old-time machinist came along and watched the writer finishing a set of drawing dies. After a while, he remarked, "I reckon that a sixteenth of an inch would make quite a difference on the fit of those dies." I reckoned so myself. Today there are not a few woodworking plants who work to limits of .001, at a fixed humidity. Relative to

general practice in manufacturing plank lumber, a corresponding increase in accuracy is called for in manufacturing dimension stock.

The second requirement is **speed.** Dimension stock must be handled fast. In some of the oldtime dimension mills, down east, which have specialized on spool bars (from which thread spools are turned) for many years, it is no uncommon case far a gang of nine men to saw and pile eight thousand feet of dimension squares per day, as an average for the season. This includes removing the edgings and waste. Experience is required to show that it is possible to produce accurately sawed dimension stock at high production

The third requirement is economy. Attention has already been directed to this point in the opening paragraphs of this article. The cost of unnecessary kerf, of careless layout of cuttings, of unnecessary oversize, of mis-sawing and of mishandling are enormously greater than corresponding faults in commercial lumber.

Furthermore, to handle dimension economically for both the producer and the consumer, it will probably be necessary to go to some expense to separate grades and lengths and sizes, and to bind these in secure separate bundles. All these precautions and careful methods cost money and must be paid for, with a reasonable profit, by the buyer. But dimension stock is worth more to the buyer than clear lumber in the plank, in nearly all classes and grades. If it is the duty and privilege of the lumber associations to educate and encourage their members to manufacture dimension stock which is as good and as standard as wheat or gold, it is equally the duty of the Associations of the Wood Using Industries to educate their members to the economic value to them of standardized dimension stock, so that their buyers will recognize and pay the higher values that lumber in this form represents, as compared with commercial lumber.

The woodusers have had the opportunity of reading this discussion from a lumberman's point of view The purpose of the next paper is to discuss the same problems from the wooduser's view point.

Apropos the Printers' Strike

UP AGAINST IT.

CAPITAL TO LABOUR. "YOU MAY SUCCEED IN KNOCKING ME OUT, BUT DON'T FORGET THAT THEN YOU'LL HAVE TO FIGHT A CHAMPION THAT NO ONE CAN STAND UP AGAINST."

—From Punch

To Trademark Walnut Line

A move in the right direction was made by the Gibbard Furniture Co., Ltd., of Napanee, Ont., when they decided to adopt a trade mark for their walnut line. The accompanying illustration shows the attractive design which has been selected. In addition to being a trade mark, this plate embodies a guarantee as to the kind of wood used.

The furniture dealers and buying public in general are looking for a high-class article, and as a rule are prepared to pay a little additional when they are assured of the quality of the piece in question. The trade-marking of a line indicates that the manufacturer believes in the quality of his product and backs that belief with his name and reputation. This cannot help but carry conviction to the ultimate buyer, and tend to allay any doubts he or she may have.

Should such a practice become general, and as the quality of a line becomes established in the minds of the public, it would not be long before people would go into a store and ask for furniture of a certain brand or manufactured by so and so. Such a tendency could not but help have a far-reaching effect on the whole industry, as it would tend to raise the quality of the product of the furniture factories, and would be a step nearer the time when the attitude of the public will be such that Canadian furniture will be made up to a standard and not down to a price.

Made-in-Winnipeg Exposition a Huge Success

Many Interesting Woodworking Exhibits—Combination Kitchen Cabinet and Buffet Featured—Other Fine Examples of Woodwork

By E. H. Chapman, of our Winnipeg Staff.

One of the most successful exhibitions ever held in Western Canada took place in the Board of Trade building, Winnipeg, from the 9th to 14th of May. It was very pleasing to see the fine exhibits made by the woodworking concerns of Winnipeg. The following exhibitors are to be congratulated upon their displays and their co-operation which helped to make the Made-in-Winnipeg Exposition the great success everyone considered it to be.

Radford-Wright-Wilson Co., Limited, featuring a combination cabinet, illustrated herewith; one side being a dining room sideboard, the other a kitchen cabinet. The cabinet fills an opening five feet wide by seven feet, two inches high. The top part is eighteen inches deep and the bottom part twenty-four inches deep. There are plain plate mirrors in the sliding doors and D.S. glass in top. The cabinet created a great deal of interest. Another part of their exhibit well worthy of mention was a very fine example of staircase work showing winding string to bottom treads which was of unusual design and workmanship, as was also the various built-in internal domestic conveniences. The Radford plant is equipped with one of the most modern lumber drying kilns in Canada; thus enabling their wood to be thoroughly dried and properly prepared before it is manufactured into the various products.

D. Ackland & Son, Limited, Winnipeg, gave a splendid display of wheelwright productions and smithy work, embracing such articles as implement shafts, double trees, single trees, neck yokes, carriage rims, wagon hitches, horse shoes, wrought iron gates and fence work, and various other articles showing expert forge work.

The Rat Portage Lumber Co., Limited, specializing in box making, of which a large variety was shown, specially designed for taking care of the transportation of all kinds of perishable products. The display also included a large variety of mouldings, particularly designed for furniture and interior house decorations.

G. W. Murray Co., Limited, showed a very attractive entrance and vestibule made to order for the 'Elite Cafe,' Regina, Sask. This was made in mahogany and was a piece of exceptionally good work, showing workmanship of a high order in the panelling and moulding of doors, walls and cealings, all being in very suitable for this particular wood.

Two new B. C. incorporations are the British Columbia Wood, Wool & Fibre Products, Limited, head office, Vancouver, B.C., capital $25,000, and The Fine Art Furniture, Limited, head office, Vancouver, capital $10,000.

Tea and Rubber Chests for Indian Trade

H. R. Poussette*

There is a large trade in wooden chests for use in shipping tea, rubber, desiccated coconut, etc., throughout the Middle East, or at least in that part of it which is under review. Although the statistics do not show the countries of origin, it seems clear from the information gained from importers that at the present time most of these chests are being brought in from Japan, under the well-known name of Momi chests.

The outside measurements of a typical box are 24 by 19 by 19 inches and ½ inch thick; its contents are 5 cubic feet and it contains from 200 to 225 pounds of rubber. The inside of the box must be planed and the ends dovetailed.

In addition to Momi chests, what are known as Venesta chests have also been imported into India, Ceylon, etc., but at the present time these are so high in price that the trade has dropped to practically nothing. Chests have been imported from Russia (or, to be more accurate, from Siberia also), but these have now been out of the market for several years. Japanese exchange is high as compared with the rupee, and it is very possible that this factor will seriously affect the imports of Momi chests from that country, and will drive the planters in India and Ceylon to make use of the local article. One Indian tea planter stated that he was able to manufacture tea chests on his own estate at 1 rupee 4 annas each, exclutive of the cost of nails; but he was in an exceptionally fortunate position as the trees grew on his own estates. He also stated that he preferred these chests, which he made out of the wood called Toon, to the imported article. Although this wood is not entirely odorless this did not appear to affect the tea. One large importer of tea chests in Colombo mentioned that he had had quotations from Vancouver, but that they were found to be just a little too high for the price ruling then, which was July of last year. The price quoted c.i.f. Colombo was 1.25 cents, which worked out taking the rate of exchange at 2.25, at Rs. 2.50 or Rs. 2/8 Indian currency, but he was of the opinion that if this quotation could be reduced to 2.61, a start might be made and at a still slightly lower price a good trade could be done. Since then the rupee has fallen, and this will have the effect of placing the c.i.f. price still higher. Now that tea and rubber are suffering acutely owing to the extreme depression of prices, planters will be compelled to use cheaper chests, and although as a rule the imported article is preferred, they will probably be reduced to using those of local manufacture. In Ceylon locally-made tea chests were selling last summer at about Rs. 2 or a little more per chest, but they were considered very inferior to either the Momi or the Venesta chest.

In Ceylon there is a demand for chests in sizes varying from 5 to 90 pounds, which is especially large for the smallest size. Chests suitable for tea can also be used for packing rubber, desiccated coconut, etc.

The wood used in tea chests must be of a particular kind. It must contain no sap which has the effect of corroding the lead, and must be entirely odorless, as otherwise tea, which has the tendency to absorb odors, would become impregnated, and therefore seriously suffer in value. It is also necessary that the wood should be thoroughly seasoned, otherwise it is likely to warp when packed with the warm tea, which is packed in this condition so as to ensure its absolute dryness, then enclosed in lead and hermetically sealed, for dryness is absolutely essential.

India is said to possess plenty of suitable wood for tea chests, but up to the present the local chest does not seem to have been able to compete successfully with the imported article, or only in abnormal times such as the present. The future may remedy this state of affairs, and India become self-contained in the matter of tea and rubber chests. A large firm of managing agents have erected a three-ply factory in Assam for the manufacture of tea chests, but it remains to be seen whether they will be able to hold their own against the imported product, should exchange rise to its par value, which is two shillings.

*Director, Commercial Intelligence Service

New Field for Wood Boxes

Among the practices of antiquity we must class the molding of cheeses in the shape of chariot wheels. Perhaps the ancients rolled their cheeses down the mountain sides to market. The making of cheese is an art bound by traditions almost sacred. Cheeses have been round because they were always round.

Some time ago we printed a little article, "Why Is a Cheese Round?" which attracted some attention. The only reason we have yet discovered is one probably first used by Mother Eve and still used by her daughters to this day to account for things mere men do not understand:—"Because."

A progressive cheese factory at Appleton, Wis., is producing a cream cheese of rectangular section, made into a convenient brick weighing five pounds. A slice of this cheese is just right for a sandwich. Four of these cheeses are shipped in a nice square wooden box. They are easy to handle, and there is no waste. The popularity of this method of packing has been so great that many other Wisconsin factories are shipping their big round 100-lb. cheeses to this factory to be cut up and molded into the new form. All is in such demand that it is sold before it is packed.

For six months the company has been able to fill only forty per cent. of its orders. As the United States produces some 420,000,000 pounds of cheese annually, this new form of cheese may be expected to provide a new market for some millions of good wood boxes.

As in the case of the apple-box vs. the barrel, the new idea is a great success, and the new form of package is likely to soon rule the market.

B. C. Church Moved Fifteen Miles

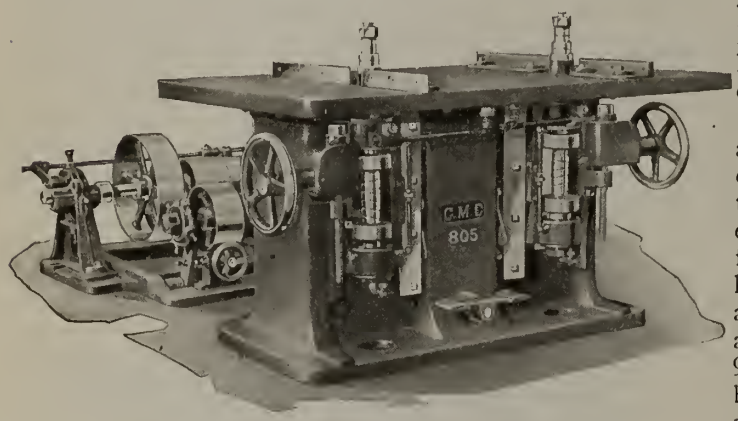
After an eventful journey, which has occupied over two months, which included "rolling" on land for three miles, navigation on scows down the Fraser River for 12 miles, then another 3 miles of jolting land transportation before finally reaching its destination, a Baptist Church has been moved from Coquitlam, B. C., to Kerrisdale, B. C.

The church was built at Coquitlam in the boom days and was intended to serve the spiritual needs of a population that never came. The Baptist Board finally solved the problem of this empty church by deciding that it should be taken where there was a congregation waiting for it, on the outskirts of Vancouver.

Machinery & Equipment

High Speed, Double Ball Bearing Shaper

The Canada Machinery Corporation, Limited, Galt, Ontario, has recently brought out a double spindle, high speed, ball bearing shaper. It is in principle much the same as the single spindle shaper placed on the market about a year ago, which met with such general approval that they decided to offer a double spindle machine of the same type. The frame, as will be seen from the illustration, is a single cored casting with broad flared base. The table is a thick, reinforced plate which eliminates all danger from vibration and concentric rings are fitted in the table so that openings of varying sizes may be made around the spindles to allow the use of large cutters. The spindles run in anti-friction, dust proof ball bearings



New C. M. C. ball-bearing shaper.

which are mounted in rigid housings. Removable collars are placed around each spindle to allow the use of different sized cutters. The spindle oiling device is new and each spindle is oiled from its own sight feed oil cup placed under the table for protection. A finished circular plate is fitted in the table directly over the oil cups and can be removed for filling or adjusting the cups. The oil feeds down through pipes over the upper ball races to a reservoir in the top bearing from the top of which it overflows and feeds to the lower bearing, and after lubricating the lower race and step ball, it fills the lower reservoir and overflows from the top of the lower reservoir to drip pan, from which it may be emptied so that oil does not get on the floor of the factory. The spindle arbors are as near solid blocks as possible. They are scraped true on the bearing surfaces and bedded in places between deep V gibs on the frame. They are vertically adjustable by handwheels. The belts are shifted by a convenient treadle belt shifter on the front of the machine. The countershaft furnished with each machine is equipped with an adjustable belt tightener which adjusts in any direction to direct the course of the belt as well as take up the slack and the pulleys may be changed to run the spindles in either direction. Spindles are equipped to run at 8,000 R.P.M.

Cut-off Saw Table

A new swing cut-off saw table has been designed and placed upon the market by the Oliver Machinery Co., Grand Rapids, Mich. The many interesting features of this table make a very practical installation. It is 16 feet long, 19 1-2 inches wide, and 30 inches high, being designed for use with the overhead swing cut-off saws.

The top is made of kiln dried rock maple, with angle iron girths and one piece cast iron legs of rigid design. The table is composed of two parts or sections. On the rear of the right hand section is mounted the scale rail, which is graduated in eighth inches from 0″ to 96″, plainly marked and accurate. On the left hand section is mounted the Oliver No. 419 patent automatic swing cutoff saw gauge, which comprises a square rod graduated on eighth inches from 0″ to 96″ plainly marked and accurate. Four automatic malleable iron stops, one centre and two end rod holders are mounted in place. This automatic saw gauge is a time saver where any number of parts are to be cut off to the same length. After the gauge is once set it is thereafter unnecessary to measure any board which is to be cut off to the length designated by the stop. Rollers are inserted in both sections of the table in every other opening the full length of the table. A dust chute is fasetned between the two sections of the table, having 6″ diameter pipe opening for connecting to exhaust system. These are the seven principal features which we give for this saw bench:—1st, most complete swing cut off saw table now made; 2nd, Has automatic stop rod; 3rd, has dust chute attached; 4th, will not warp; has angle iron girths; 5th, rigid iron leg construction; 6th, scale board has renewable scale for wear; 7th, can be used in connection with any overhead swing cut off saw.

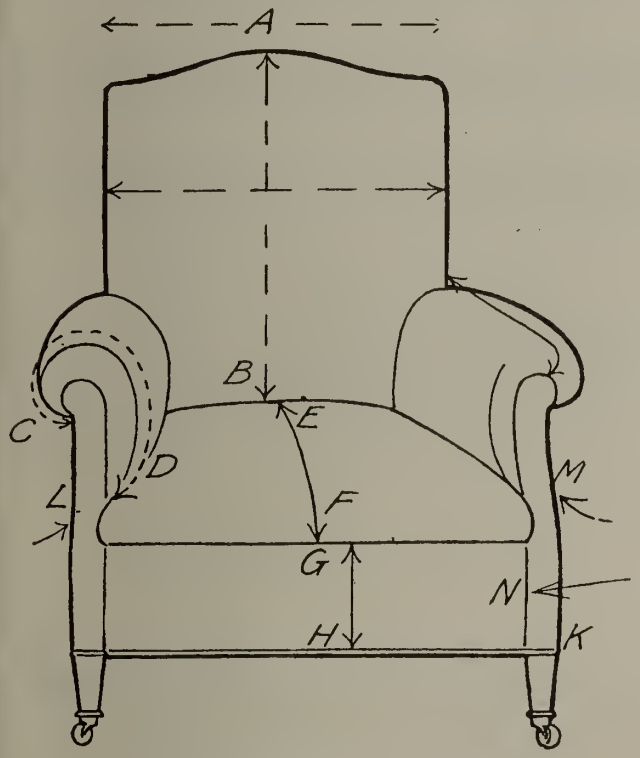
Efficient cut-off saw table.

Upholstering and Trimming

Planning and Cutting Coverings

Much Material Wasted Through Careless Cutting —Mistakes aud Waste Take Heavy Toll Careful Planning Required

The 4 in. and 6 in. mentioned above at D and E between the seat and upper parts of a stuffover chair, while sufficient for such an example as that shown, must not be taken as the general rule, but a safe plan to eliminate the danger of faulty extensions is to allow as much as possible at these parts. By careful planning the upholsterer should be able to see exactly how much material he has at his disposal over and above the net measurements, but to plan carelessly



Chair No. 302, showing pieces of covering required

or make first cuts because the quantity of material allowed appears ample is to court failure. The beginner must leave nothing to chance, and it is only by practice that he will be able to form a correct judgment of the number of inches to allow beyond the net measurements. A simple method of planning the covering for the chair (Fig. 302) is shown at Fig. 303. A to B represents a 2¾ yard length of a double-width material, the vertical line, A—B, indicating the centre fold. The width being 50 in., the measurements are calculated by 25 in. This method of cutting cannot be applied to all covering materials. For instance, with a centre pattern, it would be necessary, after obtaining the measurement of the pieces required, to mark each cut with chalk or pins and place in position on the work. It will then be seen if the various pieces are planned to the best advantage and any alterations marked before cutting. Extensions would now be added to the various pieces to bring them to the required sizes, taking care that such extensions will not be visible in the completed job. There are several ways in which the material can be planned, but the one shown is simple and should not present much difficulty to a beginner.

There is no definite system of measurement when calculating the quantity of covering material needed for upholstery, and it is only by practice that the upholsterer may become competent. Absolute accuracy is, of course, the ideal thing, but as this only comes with experience, it is better when calculating to allow a little more than a little less than is necessary, because an insufficiency entails a number of complications and difficulties in making ends meet. To calculate the quantity of material needed for a chair when it is in the first stuffed stage is more difficult than one which is second stuffed in an underlining; this is because of the extra over and above the net measurement which must be allowed for.

The following points should be remembered when measuring a first stuffed chair: (a) Correct calculations cannot be made without a knowledge of the width of the material to be used. (b) Double width materials are best calculated by the 1-2 width. (c) Visualise the proportions of the work; this is helpful in making a decision. (d) The quantities should be checked either mentally, or, preferably, in writing. (e) Extension pieces serve their purposes as straining pieces; they are useless as a remedy for a tight cover.

When making calculations first allow not less than 4 in. in a small easy chair or 6 in. in a large one for the material hidden below the junction of seat and back, then judge the amount of the proportion of the first stuffing. As a general rule, the larger the work, the greater the quantity of material required from the sight line. Study the appearance of the front of the work—more liberty may be taken as regards seams, pattern, etc., with outsides. When making up the total be sure that the balance of material, if any, is sufficient for the smaller pieces required, such as facings, arm extensions, etc. Tight covers usually mean tight corners, faulty extensions, unnecessary straining of the material, a multiplicity of seams, and finally —complaints. Careful, correct measurements mean good work, and save both time and temper when covering. When in doubt as to a measurement, the beginner should err by allowing too much rather than too little material.

Below is set out the method of calculation with a tape measure from a first stuffed chair. The additional number of inches required over the net measurement is governed by the proportion of the first stuffing.

(1)—At D, B or E insert the tape 4 in. beyond the sight line.

(2)—If the hand be placed beneath the measure at the top of arm and back and at the front of seat by raising the hand slightly above the re-

ZAPONITE is a wood lacquer

It is clearly transparent and is easily applied. ¶It dries in an hour and gives a beautiful, smooth, hard coat. ¶It is absolutely dampproof and a positive protection against cracking, checking, stretching, swelling, warping and expansion of parts. ¶For more than thirty years, we have made Lacquers and offer Zaponite as an "economy-through-greater-production" finish.

ZAPON

LACQUERS and ENAMELS

The Zapon Service Man will bring finishing experience right to your work-room and aid you in producing better merchandise and in obtaining greater production at lower costs.

Put your finishing problems up to us

CELLULOID ZAPON COMPANY
200 Fifth Ave., New York
Chicago, New Haven, Los Angeles, Philadelphia

quired proportion a good idea of the gross measurement is obtained.

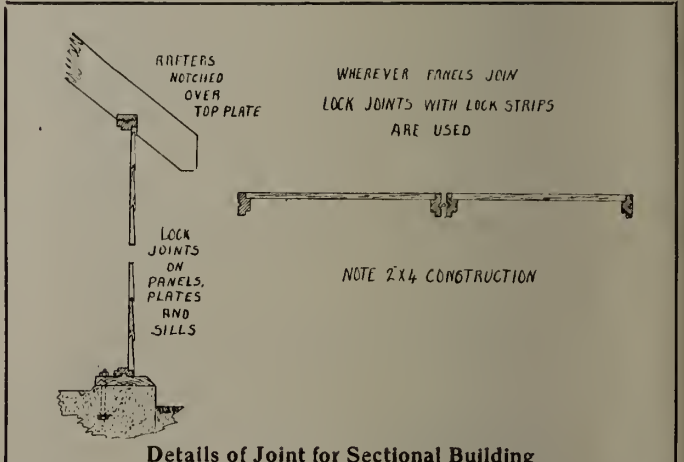
(3)—When noting the various calculations the different cuts should be indicated, viz.: I. A., inside arm; S., seat; O. A., outside arm; O. B., outside back; F., facing; B. O. R., borders, and so on.

(4)—Having cut the material for the various parts, the top edge should be indicated with chald in order to avoid the patterns being placed upside down.

In calcultaing, the inches should be reduced to yards, any balance of inches being increased to a simple fractional part rather than decreased. For example: 2 yds. 7 in. 2 1-4 ydas.; 3 yds. 1 in. 3 1-3 yds.; 3 yds. 20 in. 3 5-8 yds.; 4 yds. 21 in. 4 2-3 yds. A beginner should note any faults in calculation which become apparent when covering, comparing his estimate with the results in practice. He will in this way gain confidence, and his notes will be of value in the event of repetition work.

Joint for Portable Building

The retail lumber dealers of the United States are soon to be in a position to render a real service to their customers by carrying a line of portable or sectional garages, which are being placed on the market by the Togan-Stiles, Grand Rapids, Mich., manufacturers of Togan garages. Under present-day methods, a man considering erecting a garage, goes to the lumber dealer, and, instead of being supplied with definite information as to the probable cost of the garage, he is given a list of stock with prices, and then referred to a contractor or a carpenter for additional information. On the other hand were the retail lumbermen to have sectional garages in stock, they would be able to furnish their customer with a definite statement as to what the garage would cost when completed.



Details of Joint for Sectional Building

The Togan garage, which is being marketed through the lumbermen in the States, is noteworthy in that the designs are extremely attractive, in reality above the ordinary in this respect; also that the Togan lock-joint, used in the construction of these buildings, is unique and efficient. The accompanying sketches give a fair idea of the type of joint used. Such construction would make a solid, warm, substantial building and does away with the necessity of using unsightly batons on the outside to cover the joints formed by the meeting of the sections. Can you use the idea?

What's Wrong with Our Finishers?

Is It lack of Skill or Laxness in work? Writer Complains about Quality of Present-Day Finishes

By R. H. Stee e

It is often remarked that the little things, the trifling details that almost pass unnoticed, are the ones that count and that if due attention were to be given to these seemingly unimportant features, the larger points would take care of themselves. This applies with particular force to finishing and finishing methods, as carried on by the manufacturers of wood products, chiefly furniture and musical instruments, for it is the little details which sometimes escape attention that make or mar an otherwise valuable piece of furniture.

This fact was forcibly impressed on my mind today when admiring some fine furniture on display in the window of a well-known furniture dealer. Several of the larger and most expensive pieces were depreciated by unsightly blemishes on their finished surfaces. The first thought was why did not the gentlemen responsible for the window select a perfect piece or suite for display purposes, or, at least, place each article in such a position that the blemishes would pass unnoticed. Upon second thought I decided that this was not just the fair or honorable thing to do, and that the blame lay not with the retailer, but with the manufacturer. To carry the investigation a little further, I purposely viewed the window displays made by several other dealers, and in almost every instance the finish of the pieces shown was open to criticism. This naturally brings up the query, "Is it possible, or even difficult, to impart a perfect tone and finish to an article of wood?"

Requires Careful Attention.

Were the above question to be put to almost any man in the finishing departments of our plants, the answer would be, "No. It is quite easy to impart a good finish, but it requires careful attention to detail." The crux of the problem is in the latter thought.

"It requires careful attention to detail." That opinion bears out the conclusion arrived at when examining the furniture on display in the store window. In one instance the blemish was a light streak in the panel of a buffet door that had been touched up with too dark a stain, leaving a dark brush mark down the centre of the panel. Another was a spot on a carved ornament that had been missed. In a third place the wax or pumice had not been cleaned out of the members of the mouldings and ornaments, showing up white in the crevices. In another a hole had been filled with a substance that was lighter than the finish of the article, naturally drawing attention to the blemish that it was supposed to hide. If continued, the list would include poor toning and shading, poor varnishing and numerous other undesirable features.

Perhaps I am too critical and inclined to pick fault rather than overlook some trifling details while admiring the beauty of the piece and the general result secured. Again the strong, clear light of the large windows might emphasize and exaggerate blemishes that would not be noticeable under ordinary conditions. That is not the point, however. If furniture can readily be given a satisfactory finish without any noticeable increase in cost, then such defects, even though they are inconspicuous and unimportant, should not be permitted to pass inspection.

The buying public is not only demanding low values at the present moment, but is insisting upon high quality. In other words, it is striving to make its dollars do double duty. That being the case, it is more important than ever that "attention to detail" be made the motto of every finishing room. Again when there is a growing tendency on the part of furniture makers to trade mark or otherwise identify their product. It would be extremely foolish for a manufacturer to permit his name or trade mark to be connected with an article that is not up to the mark in every respect.

Must Produce Satisfactory Article.

The furniture industry is endeavoring to advertise the value of better furnished homes, and the lasting satisfaction that goes with the possession of fine furniture. There can be but little satisfaction unless the article is perfect in every detail. Blemishes and faults seem to grow and become magnified with daily association, with the result that some little marks that were probably overlooked when the furniture was purchased assume undue proportions as time rolls by. I know for I have a walnut buffet that was not finished as it should have been. It is putting it mild to say that I am not satisfied. When I replace it, as I intend to do, I will make sure that the new piece is not the product of the same maker.

The furniture manufacturers should give greater attention to the finishing of their product, for, after all, it is the finish that counts most. The experts in the finishing department should be trained to strive for perfections and should not be satisfied with anything less. The foreman finisher or some specially appointed inspector should examine every piece before it leaves this department, and should be shouldered with full responsibility for the reputation of the whole line as far as the quality of the finish goes.

The Vogue of Painted Furniture

There seems to be a revival to-day of the ancient art of painting furniture, but the makers are going carefully and slowly. The students of art and furniture say that this is only a "feeler" anticipating the day when truly beautiful painted furniture will be as much a part of the home as the stately mahogany and walnut "solids" of to-day.

As proof, they cite the fact that the furniture sections of museums are full of the painted furniture relics of former centuries, and are prized as the rarest of artistic contributions to civilization.

It has been proved that the frieze around the Par-

thenon at Athens was originally in colors, although carved in marble. Ancient China gave wonderful lacquers which were borrowed by Chippendale for his precious cabinets and desks.

There is nothing in the Metropolitan Museum of New York valued more highly than a pair of antique Persian doors painted in rare colors and designs that have been an inspiration to thousands of designers. These colors and patterns have been applied to modern-day rugs and textiles in great profusion.

The peasantry of the Tyrol, Norway and Switzerland has left a rich heritage of painted furniture. The ancient carved furniture and woodwork of the Gothic era was originally picked out in colors. The Georgian era of Sheraton, Chippendale and Heppelwhite also had the Brothers Adams, who did not scorn the making of painted furniture. That is why no one can be accused of "poor taste" by selecting some of the best of today's painted furniture, however inadequate the supply is.

In placing a line of painted furniture on the market, the manufacturer should keep a pattern of all styles and designs used, so that a piece can be readily replaced or matched. Another suggestion is that all coats from the primer on, should be the same shade as the finishing coat.

Why Not Bamboo Furniture?

The supply of wood for furniture making is not near exhaustion yet, but some interest is attached to the suggestion of the Times, a newspaper of Indianapolis, Ind., as follows:

"The time has passed when the only use for bamboo wood is to constitute a cheap fishing rod. The scarcity of timber, added to the rapid growth of bamboo, places that wood among the commodities destined to push to the front.

"There is no use worrying what the future generation will do for fuel when the coal is gone, nor for timber when the forests are exhausted, for ample provisions will be made in due season. Given the necessity, the human mind will solve the problem with perhaps better results than ever heretofore achieved. So many instances exist that it is almost folly to call them to mind.

"If the bamboo is not as long lived as the hardy lumber from slow growing forests, at least it may be replaced while waiting the maturity of our own trees. An oak or hickory piece of furniture, made from local wood, requires one or two generations for growth, while the year may see the bamboo planted, harvested, fabricated and in use in the home."

Qualifications of a Manager

The temper of a manager is one of the biggest assets or liabilities that any concern can have. It might be alright for some supernumerary to lose his head once in a while, even though that is not desirable, but the director of any organization must be able to control his temper. This does not mean that he must never get angry, but that he must never show it in any way.

A manager of any organization who gets into a rut or who does not attend to anything but his office duties, should be excused from his position, by his board of directors, as soon as convenient. Just about half the work that a manager undertakes should be at his office or for his company directly. Any manager who does not take an interest in civic and national affairs, should not be retained in the position he holds. In appointing a new head, he should be asked before his appointment is confirmed, whether or not his qualifications are such that he is equipped to work in a general field shoulder to shoulder with the big men of other organizations. The boards of trade, the Rotary and Kiwanis clubs or other similar organizations offer fertile fields in which a man can show his ability.

Expert Quantity Surveyors

Special organizations devoted to taking off quantities from architects' plans and specifications are springing up in different centres in the United States. These organizations or bureaus, as they are called, secure the co-operation of a number of woodworking plants who agree to pay a certain percentage of the cost of the work secured for the service rendered. This service consists in taking off from architects' plans all the details pertaining to both outside and inside millwork and furnishing typewritten copies of the same to the subscribers. Doors and sash are included, and in the case of out of town jobs, the details of the stairs. The correctness of these figures are guaranteed.

The idea is a good one. Suppose a bureau had twenty subscribers. Formerly each of these plants had one or more men whose time was taken up with taking off quantities. Naturally the same plans would be figured on by a number of concerns, which would result in an expensive duplication of effort, and in addition mistakes and guessing were bound to creep in. With the bureau, half a dozen expert listers can do the work which formerly occupied the time of from twenty to thirty men.

Newer Uses For Sawdust

Until quite recent times sawdust was regarded in wood mills as a waste product. Now it serves many purposes and has a commercial value that appears to be on the increase.

Sawdust is particularly useful in the manufacture of various building materials. Mixed with clay it makes splendid tiles and bricks, while combined with concrete an economical and good-wearing flooring material is obtained.

To French chemists belongs the discovery of sawdust dyes. They found that a combination of various chemicals acting upon sawdust produced a substance which is said to be quite as effective as the best aniline dyes for coloring purposes.

In Germany during the war a huge amount of sawdust was used for making bread. It was first treated with chemical agents to extract certain harmful ingredients, after which it was mixed with flour and baked in the usual manner.

Probably the most remarkable discovery of all is that a gas, excellent both for lighting and heating purposes, can be made from sawdust. From experiments that have been conducted, it is believed that, particularly in the neighborhood of sawmills, the gas could be produced so cheaply as to be supplied for a few cents per thousand feet.

Will *you* try this test?

This is an easy, practical test of La Tuque Turpentine, made from Canadian wood, by a patented process. Dip a piece of pure white paper into La Tuque Turpentine to about one-half its length, place in a warm spot to dry. In a few minutes when the turpentine will have evaporated completely, compare the portion dipped with the remainder of the sheet. It will be clean and unstained, with no trace of grease of any kind.

LAST year Canada imported over one million gallons—three hundred carloads—of turpentine from the States.

Importations have averaged that amount for the past five years.

And for the three hundred carloads imported in 1920, Canadian manufacturers paid an average price of $1.57 per gallon in American money—over one and one-half million dollars—in the States *before shipment*, to which should be added the cost of freight, and cartage.

This year it isn't necessary to buy the imported product, however, unless one wishes to pay the higher price, as an equally efficient Canadian-made product is now available, which not only does the same work and does it as well, but costs less per gallon.

Used as a thinner for wood thinners or enamels, for oil or japan colors, or for reducing oil stains, you will be satisfied with the result, for it evaporates smoothly and evenly and has particularly good penetrating power.

In addition, La Tuque Turpentine has one other advantage—*uniformity*. Due to a carefully standardized technical control of the output at our mills at La Tuque, P. Q., moisture and free rosin are eliminated, ensuring uniformity of every gallon that leaves the plant. Can uniformity be claimed for all of the turpentine you have purchased in the past?

Nearly as colorless as water

Compare a test tube of La Tuque Turpentine with pure water. They look very much alike, for the turpentine is nearly as colorless as water.

If you would like further specific information regarding the application of La Tuque Turpentine to your particular needs, or desire a liberal working sample for testing purposes, we shall be glad to hear from you

Veneers and Panels

Faith, Confidence — More Confidence

J. T. Horne, President Veneer & Panel Manufacturer's Association, Delivers Inspiring Address on Present Conditions.

It has now been six months since we met here as a body of representative veneer and plywood manufacturers, and during that time our souls have been sorely tried by the depressed business situation, as it is to-day, and as it has been during the past six months. In the language of the philosopher, Abe. Martin, "We're meddlin' in European affairs, the price of utilities is goin' up, the income tax burden is to be lifted from the shoulders of the rich and spread around, the mail is late every other day, the sawmill is closed down, soda water is still fifteen cents, and we're gettin' back to normal fast, we don't think." We have had, during the past year, profiteering and extravagance, high prices, high wages; we now have falling prices and a buyers' strike which is still on in full blast. We now have low production, shut-downs and unemployment. We have had railroad congestion. We now have idle cars. We have had big inventories and big losses, big crops and shrinking values; we have had and still have a very serious housing shortage with high rents and dissatisfied tenants. We have had large bank deposits; we now have declining bank deposits, with a big demand for loans. The tax man is after us with a big stick, and some of us, we are sure, will be compelled to borrow money with which to meet our income and excess profits tax of 1920. And who is to blame for all this?

Placing the Blame.

As a general proposition, when things go wrong, our natural inclination is to look for some one who has been at fault and upon whom we can place the responsibility. For our present unfortunate business depression, everybody is inclined to blame everybody else, but without reason. The truth is that no one in particular is to blame. Parallel conditions exist in all countries. We and all the so-called civilized world have been and are now in the grip of economic forces too strong for any class, any monetary power or any government to avoid. The expansion of credit, the high prices for labor and for goods, the fictitious prosperity and the resulting industrial crash were the inevitable and unavoidable aftermath of the costliest war in all history. They are all explainable by and attributable to the workings of the law of supply and demand.

In our particular business, veneer and plywood, and it is no exception to the general rule, the demand for our product during the past six months has been at the lowest point in the lifetime of the men who are here to-day, and allow me to say here that during a period of twenty-nine years in which we have been actively engaged in the manufacture of some product from timber, that the past nine months is the only time in the twenty-nine years of our experience that we have been unable to sell our product at some price, and I am quite sure that there are men here to-day representing other mills who have found the same condition to contend with that we have. The principal reason why there has been no greater demand for our product is for the reason that during the time when our product was scarce and prices abnormally high, the buyers of our stock seemingly bought everything in sight, regardless of price, and piled their warehouses to the top with this high priced material, and when the slump in prices came—as we all knew it would come—they were unable to dispose of their finished product at a price based upon the cost of the raw material that would let them out without an enormous loss, consequently their warehouses are still stocked with high priced veneer and panel, and being unable to realize a profit based on the cost of their material, many of them are closed down.

Prices Not Controlling Factor.

I feel very sure that some of us, during the past few months, have quoted prices far below the cost of production in an effort to dispose of our output, and keep our plants in operation, and have met with but little better success than those of us who asked a fair price for our product, as in either case but a very small percent of our normal production has been sold.

The law of supply and demand is as old as civilization itself, and it always has, does now and will continue to rule so long as man inhabits the earth. But even with this gloomy outlook of the past, I do not believe that we should be discouraged or disheartened. We certainly believe in ourselves and in our country, and are all proud of it. We are just as certain to have good business in the future as we have had in the past, and there is no question that that we can work out our business problems, and as stated, finally come back to a prosperous time. But it will take to do this, first, intelligence, and this we manufacturers all have, of course. And we must use this intelligence in an intelligent way and not expect values to come back to wartime prices in a day's time. It will take our concentrated effort; it will take all the patience that we can use, and time. How much I will not venture to say. But above all, it will take faith—faith first, in a Supreme Ruler—faith in our glorious country—faith in ourselves—and last, but not least, faith in our fellow man—faith to believe in him—faith to believe, not in the golden rule, but to believe the golden rule, and to believe that it is applicable to the every day life of the business world; that it was made for you and me, and when we and the balance of the business men of this continent come to see the value of the golden rule, and are willing to apply it to themselves and do for their customer and for the man with whom they deal as they expect their customer and man with whom they deal to do by them, then the day will soon come when we can rest assured that when we have sold one or mor cars of our

Plant of the Penrod Walnut & Veneer Company, Kansas City, Mo.

The Manufacture of Walnut Veneer

Walnut Coming into Its Own—Excellent Material for Furniture and Interior Woodwork—Interesting Phases of Its Manufacture

No home should be without it's black walnut furnishings, for black walnut is particularly attractive, and is considered by many to be the peer of hardwoods for furniture construction and for interior trim. Surely, there are but few hardwoods that can compete with the inherent dignity of walnut, its exquisite markings, and oftimes bizarre yet symmetrical figuring secured from the gnarled burls peculiar to American walnut. Truly this strictly American forest product is deserving the eulogy of the poet for in this hardy wood nature has secreted many wonderful treasures of beauty.

There has in the past been little attempt to generalize the use of walnut in spite of the fact that it was highly prized by every housewife who could boast of walnut furnishings. It seems that woodworkers in European and other foreign countries were first to fully appreciate the value of walnut, and they could not comprehend why North American manufacturers and woodworkers neglected to utilize this wonderful wood with its fine grain, its natural beauty and adaptability to the best work of the skilled carver and woodworker. And so walnut logs were conveyed across the Atlantic for European artisans, while our own artisans, blind to its virtues, were importing extraneous woods to adorn our homes. Then, too, it seems that manufacturers on this continent were the victims of a propaganda to the effect that walnut was scarce and hard to secure, and that they could not depend upon a continuous supply in the event they specialized in or produced a line of furniture in American walnut. In many of our high grade furniture houses, little or no attempt was made to sell merchandise of walnut; rather the buyer was led to feel that other woods were preferable and good dollars were invested in woods of foreign origin.

Continuous Supply Available.

However, it has been demonstrated during the past three or four years that walnut is not a rare wood on the verge of extinction, but, instead, we have learned that the supply is sufficient to meet any domestic demand for years to come, for furniture, interior trim and other commercial usages.

One of the leading organizations dealing exclusively in walnut lumber and veneer, is the Penrod Walnut & Veneer Company of Kansas City, Mo., of which J. N. Penrod is president, R. L. Jurden, vice-president, and J. C. Rodahaffer, secretary and treasurer. The company was organized in 1896 by J. N. Penrod and Judge S. F. Prouty, the latter retiring from the business in 1914. Mr. Penrod has been connected with the walnut business practically all his life, and got his early training in the trade in Indiana, where he bought and sold logs. He also was connected with the firm of John H. Lesh & Co., as buyer and salesman for many years prior to establishing the Penrod Walnut & Veneer Co. Mr. Jurden, who is also president for the Penrod Jurden Co., Inc., Memphis, and one of the most progressive factors in the hardwood industry, opened his lumber career in 1904 with the Penrod Walnut & Veneer Co. He is a thoroughly experienced operator in all departments of lumbering. Mr. Jurden succeeded Alexander Lendrum as secretary and general manager of the Penrod Walnut & Veneer Co., in 1913, and became vice-president in 1917. Mr. Rodahaffer was previously connected with Geo. W. Hartzell of Piqua, Ohio, first as yardman and in the later years a member of the sales department. He was also on the sales force of T. B. Stone Lumber Co., for four years, and in 1908 returned to the Hartzell Company as sales manager.

Have Large Output.

In total the members of this firm are experienced and practical walnut men. Their superintendent of veneer operations, J. S. Stone, who, incidentally, is a stockholder and director in the company, is recognized as being the best authority in the country on walnut veneers. Mr. Stone has had long experience in the veneer business, both as a manufacturer and consumer. He had charge of designing and construction of the Penrod Veneer Plant, which is located on the Kansas City Terminal Railroad, with direct connection with the principal trunk lines reaching Kansas City.

The daily cut of the sawmill is 15,000 feet of logs, and of the veneer mill 4,000 feet of logs. The latter is equipped with two Capital veneer lathes, one 124 inch

Perfect Drying ~ Always

Correct drying is the most exacting science in woodworking. It is consistently accomplished in Wood-Mosaic plants through the employment of recognized experts and exacting care in selecting kiln operators. So perfect has the Wood-Mosaic system become that it is able to furnish veneers guaranteed to specific moisture content and lumber dried correctly for the purpose intended. Our veneer and lumber driers have all been selected after long experience and painstaking investigation. They are so constructed and arranged as to be adaptable specifically to the different requirements of any kind or thickness of stock. Their operation has been scientifically checked by laboratory experts and found correct. Four Texile dryers do the work in the veneer plants—twenty-one modern kilns in the lumber plants.

Wood-Mosaic hardwood lumber and veneers in walnut, oak and poplar are always in demand because of selected timber, splendid manufacture and always perfect drying.

ALGOMA *the Better* Plywood

Admiration!

Admiration for his finished job inspires your workman to better craftmanship.

Admiration for what you have to sell attracts the ready customer.

You can encourage admiration by the kind of plywood you use. Better matching of the grain—better surfacing—better gluing—better seasoning—more accurate cutting to each dimension—these are qualities of plywood which determine the quality and selling power of your product. For that reason, Algoma, the better Plywood deserves your consideration. Made in all sizes and shapes to fit your requirements. Investigate the economy of our stock-sized panels, which save on the cost through standardized manufacture. Let us give you estimates.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

Views Snapped in and Around the Penrod Plant

VENEERS

The Quality Kind

We carry in stock, for immediate shipment, 3 and 5 ply Panels in Birch, Oak, and Mahogany — sizes 24" and 30" wide, 48", 60" and 72" long.

A complete range of American Walnut, Quartered Oak, Mahogany, Figured Gum Veneers and Rotary Cut Veneers.

It is not uncommon that a really fine piece of furniture has been practically ruined after a few months service because of the poor grade of veneer used. Such happenings do much to harm the manufacturer's reputation. That is why many will not consider anything but the best—usually they insist on Toronto Veneers—the quality kind.

Toronto Veneer Co., Ltd.

1100-1104 Queen St. West, TORONTO, ONT

Walnut, Quartered White Oak and Mahogany Veneers and Lumber

Prompt Delivery

LONG-KNIGHT LUMBER COMPANY

INDIANAPOLIS, IND.

knife with 72 inch swing, and one 10 2inch knife, cutting about 75,000 to 100,000 feet of veneer daily. Three large warehouses hold about 10,000,000 feet of veneers, and a stock of walnut lumber approximating 3,000,000 feet is maintained in the lumber yard. Logs are shipped to Penrod, of Kansas City, from practically every source where there is sufficient to make a carload, but the principal supply is obtained from Illinois, Missouri, Iowa and Kansas.

Ideal for Interior Trim.

The great volume of the company's business goes principally to the furniture and panel trade. but it also specialises in interior finish, one of its latest contracts covering the interior trim of the new $200,000 home of the Hereford Cattle Breeders' Association, Kansas City; also the Linwood Boulevard M. E. Church, the largest church in Kansas City, which required about 40,000 feet of walnut lumber and 8,000 feet of veneer, the big structure being finished throughout in walnut.

Until a few years ago the walnut lumber business was largely export, Mr. Penrod personally making frequent trips to Europe to look after foreign trade. However, during the past four years the company has devoted their entire time and energy to the manufacture of veneers and lumber for the domestic trade, giving special attention to the needs of the furniture manufacturer in the United States and Canada. The company also puts special emphasis and gives special attention to the builders of good homes, office buildings and all public buildings, such as churches, theatres, etc., as there is no wood to equal walnut for interior trim when it comes to real beauty and service combined.

Penrod service is a trade axiom, which those who have tested this service readily appreciate. This service does not merely mean prompt shipment made possible by warehouse and yard stocks, coupled with excellent transportation service, but it also signifies an understanding of walnut lumber and veneer utilization by men who have "been through the mill," or conversely, a practical comprehension of trade requirements.

Faith, Confidence — More Confidence

Continued from page 95

product, that the buyer will take it as he agreed to take it, and also be assured of receiving just exactly what he bought.

Employer Must Do His Part.

From our viewpoint, we believe that labor to-day is far more efficient than it was six months ago, and we believe it will continue to be more efficient as time goes on. There are entirely too many idle men in this country, and so long as our food products are sufficient to feed, not only our own people, but many of the starving millions of the earth, there is no reason why the man who labors with his hands in this country should not receive just compensation for his time and labor, and no reason why he should not give an honest day's work for the pay which he receives.

I fear sometimes we are inclined to want to unload too much of our burdens upon the men who labor for and with us in our factories. We should use every economy in every department of our plants; use some economy in our own expense account, and if necessary draw less salary so that we may be able to reduce the cost of production to a point at which it will sell based on the earning capacity of the laboring man and the farmer. The farmer, as we all know, has been very hard hit; his products were the first to come down, but they are going bravely on, and he who works either with his hands or on the farm should be assisted by us manufacturers in every way that is possible, for they are our best customers. It has been said, and no doubt truly said, that the farmers and the laboring men of the country, and they are our freest spenders, spend annually more than all the balance of our population.

You hear it said almost every day that if railroad rates were reduced it would help business. I hope this is true, and no doubt rates will be reduced in the very near future, and they should be, and while the reduction of freight rates and passenger fares would be a great help, it is not the big thing in our minds, but the biggest cause of all as to why we are in our present condition that can be remedied is the financial situation in Europe. We all know very well that we have enermous food products in this country, and an enormous lot of manufactured products of all kinds, raw material with which to make more, and still there is no demand with which to make more, and still there is no demand from abroad, and there can not be a demand until these people are financed and put in position where they can take our surplus output. We have almost one-half of all the gold in the world, and as has been said by one of our leading financiers, there is such a thing as having too much money. It is not so much that we want their gold, but we want them to buy our products, and they can only buy them as we are willing to take their products from them, and I am sure right here is where I will get into trouble with some of you men when I state that I do not believe the United States needs to put a prohibitive tariff on the products of the Old World, and while it might help us as manufacturers of our products to have a tariff on lumber, I am not in favor of it, for the reason that we need now in America millions of new homes. Rents are abnormally high, as I have already stated, and they will not be reduced until houses are built to house the families of this country.

And finally, let me say this in closing—that if we leave this meeting with our minds fully made up, each of us, that we are going back home and do our very best to give employment to every man that we possibly can; that we are going to co-opertae with every other industry in so far as we are able; that we are going to apply the golden rule to business; that we are going to play the game square—by the time we meet here in Chicago in December, I am sure that many of the dark clouds that now hover over will have rolled away, and we will all return here with a more optimistic feeling than we have to-day.

Why is Business at a Standstill?

A Contractor's Viewpoint on Existing Economic Conditions and his Suggestions for a Return to Normal

By "Logus"

The real reason that business is practically at a standstill is because all things cost too much to produce. They cost more than they are worth. The worth of a product is what someone else will pay for it. At present, possible purchasers will not pay the present costs of production in any volume greater than absolute necessity, because in the great periphery of business all cannot afford to pay the costs of production. So at various points on the cycle of business, the line is broken and the procedure stops. The cost of a product is the combined compensation of all labor used and paid for in that product. Whether Carl Marx, or Henry George, or Laughlin, Perry, or Cobden, there is no disagreement on this, and the only disagreement is the relative value of capital, promotion and sale together with the great and most costly element: labor. No fair critic can deny the equitable value of each element nor can he conclude that in the evolution of business one element can maintain a high relative standard while one or more other elements are fixed at a lower value. Ultimately and naturally they must be uniform.

Why is there no sale of products now at present prices if wages are still high, while a year ago, with prices a little higher there was a good market? Because a year ago there was employment and to-day there is the least for many years. If no money comes in none can go out except small sums of any surplus there may have been from previous employment. Where has the money gone that dropped like rain for a few years? Mainly, it was used to pay individual and corporate debts and finally lodged in the hands of those individuals or institutions that had originally loaned the sums. It has also shifted not alone from individuals and corporations, but from nations, and now lies idle because no means can be found to start it again in circulation.

Was there an increase of the intrinsic value of wages or values of commodities in the proportions of the increase in denominational lines? By no means, no. Why? Because had the intrinsic increase been the same as the denominational, all surplus would have increased in similar value, and if $2,000 was the income and cost of maintenance of a person, family, or commodity for a definite term or thing, and the intrinsic value including increase had been made $3,000, there would have been an unused surplus of $1,000, but the intrinsic value was the same, but the denominational value enhanced $1,000. By the denominational value is meant thta value stated in terms of dollars or pounds, or any other value based on the value of any unit or sub-division of a unit fixed by weight in gold. All realize this is standardized, but not so the service necessary to make an equitable exchange. This is variable, and as during the war, gold was needed to make international exchange balances in greater quantity than there was gold at the sources of purchasers, creating adverse balances, and it rose to a premium, and as this value is fixed, the premium operates in inverse ratio upon commodities and labor. Hence more service had to be given to conclude transactions, and to induce the provisions needed, they not only maintained the previous prices and rates, but increased same to overcome the depreciation in the relative value of the service. This method to the unthinking might appear possible, but it was gold that was needed in the exchange more than service, because the first is transferable from country to country, but not the latter, and instead of moving ahead in this Micawbian method of finance, the difficulties were increasing and the movement was backward in place of forward.

What happens under such circumstances as regards money? It is plain that if eight million people daily, or weekly, or monthly require 211 million dollars to complete these transactions in 1914, and they double the denominational value of the same business in 1920, they will require 422 million dollars to do the same business. But the intrinsic value of the dollar would be the same. All the people had worked all the time, and all the products were worth the whole of all the service and to double the value of the goods in price did not give anyone a cent in gold value more than the whole. This has actually happened.

On March 31, 1914, Canada had $141,823,281 in gold and $211,144,102 in note circulation, and on March 31, 1920, she had $190,777,106 in gold, and $440,002,420 in note circulation. This inflation in currency is reflected in the increase in price of commodities and as commodity is probably 90 percent, labor in the ultimate service was paid for in legal tender, but not in gold equivalent. On March 31, 1914, gold represented 67 percent of the note circulation, and wages, we will allow, were standard at 100 percent. On March 31, 1920, gold represented 43 percent of the note circulation, so then to provide 100 percent as represented in inflated price and currency, note circulation was increased 64 1-2 percent to make a denominational equivalent and the intrinsic value was the same.

From the foregoing it appears that, taking wages of say 50 cents per hour in 1914, by the increase in circulation 82 1-4 cents per hour in 1920 represented the same pay as did 50 cents in 1914, and the proportion holds at every wage. All know what happens when one makes notes more than he has money to pay with when they become due; and all must realize that governments and banking institutions are subject to the same unyielding rules. These notes must be retired. We cannot continue issuing notes, and we must return to a position where notes and gold are much nearer a parity. This can only be accomplished by producing at less costs than present denominational values impose, and as labor is about 90 percent of cost of production, labor must constantly contribute its proportion to its reduction. Such reduction is not a sacrifice of any part of the intrinsic value of the wage, but only its proportion of the value of the retrenchments of inflation.

It is useless and idle to argue with those who cannot see, and worse to take time with those too perverse to admit when they do see. It is not a time to "coddle" and invent other worse expedients than those

already existing, but all should "look the trouble right in the eye," and make up our minds that we must regulate our affairs in keeping with, we may say, universal conditions. We were just as well off when 10 hours' work bought a barrel of flour at $5.00 as we were when it took 10 hours' pay to buy a similar barrel at $10.00, and to-day the great majority of men in the class of work which we are considering would be far better off if they had any work at all at any reasonable wage. But a prophecy that wages will continue to drop and likewise commodities until they are, say, 35 to 40 percent less than 1920 will be borne out by the experience of those who will see the next five years. Some may think the writer has a chronic antipathy against labor, but such is not the case, as were they to make any sacrifice or concede any reduction not participated in by all through the whole line of production, he would oppose it as useless and unfair. But the conditions are universal and the remedy must likewise be universal, and there will be no difference in the whole relations. If they will see the affair as it exists, they will urge and advocate these changes now and from time to time until a normal condition is established again. And we believe they will see it and help materially in obtaining it.

CUTLER APPOINTS CANADIAN REPRESENTATIVE.

R. C. Dunbar has been appointed Canadian representative for the Cutler Lumber Drying Kiln and the Cutler Varnish Drying Kiln, as manufactured by the Dry Kiln Department of the Cutler Desk Co., Buffalo, N.Y. For the present he will make his headquarters at 885 Shaw St., Toronto.

Mr. Dunbar, who is a Canadian by birth, has had many years of practical dry kiln experience, and brings a vast fund of practical knowledge to bear on his new position. Previous to representing the Cutler Kiln in the Chicago and Middle West field, where he succeeded in making many satisfactory installations, he supervised the drying of lumber for airplane propellers for the U. S. Government, being assistant to James E. Imrie, a well known expert, who was in charge of the Wood Products Department, and who is at the present time consulting engineer for the Cutler Kiln Co. Among other duties Mr. Dunbar supervised the seasoning of the stock and the manufacturing of propellers in about twelve large plants in Grand Rapids, Milwaukee, Kansas City and Chicago, and was always in close touch with the practical side of the work. His knowledge and experience are at the service of any woodworker desirous of improving his lumber and varnish-drying and lumber-handling methods.

Group or Individual Drive

There is considerable discussion, both in the electrical industry, and also in the woodworking industry, as to the advantage of individual drive, group drive and drive of whole plant by a large motor, replacing the engine or former driving unit. We believe the decision of matters of this nature is far better made in consideration of the individual problem presented by each individual plant, rather than to attempt to make general broad recommendations. In favor of the small motor drive, is the advantage that a machine not being used can have its motor cut of, but it is open to question as to whether economy of cutting down the load by some small motors being cut out, is offset by the fact that these small motors are lower in efficiency than a motor of larger size. There are some machines used very infrequently or in a location where individual drive may be a great convenience, but the large majority of our plants are getting very satisfactory results by driving a group of machines which are conveniently located and most of which are operated at the same time in the work being handled by one motor. A practical combination of group drive and individual drive based on local conditions, is about the best general recommendation, and it is very seldom that the driving of a large plant by one motor is advisable.

Are Five Plys Necessary ?

The question as to whether or not it is advisable to lay five-ply panels in one operation is receiving a considerable amount of attention. In this connection the advantages or disadvantages of four and five-ply panels might be included. If four-ply were used, and such construction has been advocated in preference to the so-called balanced or five-ply construction, they would, probably, be laid up at one time. The suggestion has been made that a well-made three-ply core, in which the outside layers or crossbanding are together equal to half the thickness of the core, is sufficiently stiff and stable to carry a thin face veneer without the necessity of compensating any strain or pull by applying a ply of the same relative strength on the reverse side. Some interesting experiments could be carried out in view, and if the results warranted the elimination of the fifth ply, a considerable saving in first cost would be effected. Send along your views as to the practicability of four-ply construction.

Securing New Business

One hears a lot about high construction costs holding up building. One woodworker recently made the statement that low prices never made one sale of building material. The basic idea behind the sale is a desire for the article purchased and that desire can be created and strengthened by advertising.

There is a whole lot in this idea. If a strong enough desire for a home be aroused, price or construction costs are of little moment, for that home is going to be built regardless of the outlay required. In view of that, is the woodworking industry making a mistake when it sits back and awaits lower costs rather than make an attempt by general publicity and direct by mail literature, to create a desire for its product, which would result in a larger volume of business.

Some of the largest woodworking concerns on this continent have built up their business through advertising. They issue catalogues, pamphlets, booklets, which are attractively prepared and in which appear many, particularly colored, illustrations, and in this way they have succeeded in creating a desire for their products, which results in business from all parts of the country. Their trade is not confined to the locality in which their plants may happen to be, nor is it confined to any one state or province, but comes from all parts of the country, from coast to coast, shipments going to even the remotest districts.

There is a lesson here if we will but take it to heart. The size of the business which we can develop, depends entirely on the efforts we are willing to make.

WHEN THE ABILITY TO SERVE COUNTS MOST

When things are spotty; when your factory is filled up for a couple of weeks and then is practically empty; when even though you know lumber is a good buy, you are afraid to stock up and instead place rush orders for just what you need—then is when a time-tried lumber organization with a steadfast record for service and dependability, is a real asset. Our many years experience; our diversified and modern manufacturing facilities and the varied assortment of southern hardwoods, rotary veneers and plywood, are as well adapted to give satisfaction in filling to-day's hurried needs as in supplying big contracts in more normal times.

Regardless of your position, this organization merits your investigation.

ANDERSON-TULLY CO.

MEMPHIS

News of the Trade

The Watson Manufacturing Company and the Brantford Willow Works, both of Brantford, Ont., report that they are operating at 100 percent production.

Walter McLean, Wallaceburg, Ont., contemplates erecting a planing mill, and is desirous of securing prices on the necessary equipment.

A. & D. McGowan, 21 Main St., Toronto, have commenced work on a toy factory to cost $8,000.

The Bell Furniture Co., Limited, Southampton, Ont., closed down recently for two days, while erecting the new smokestack which is replacing the one blown down some months ago.

The Planahome Mfg. Co., Limited, Winnipeg, Man., was recently incorporated to manufacture and deal in woodwork and building materials of all kinds; capital $20,000. S. G. Layton and F. H. Mitchell are among the incorporators.

The Knechtel Kitchen Cabinet Co., Limited, of Hanover, Ont., has been authorized by supplementary letters patent to change their name to the Knechtel Kitchen Kabinet Co., Limited.

The Egan Phonograph Co., Limited, Toronto, has been incorporated to manufacture and deal in phonographs and other musical instruments, and to take over the business known as the Egan Phonograph Co.; capital $40,000. A. J. Trebilcock and J. F. Lennox, both of Toronto, are among the incorporators.

The name of Batts, Limited, Toronto, manufacturers of sash, doors and woodwork of all kinds, has been changed to the Buyers Door & Mfg. Co., Limited. J. S. Bond is managing director of the new concern.

The Alliston Wood Products, Limited, Toronto, has been incorporated to manufacture and deal in toys and wood specialties; capital $100,000. Among the incorporators are P. D. Trudell and L. E. Dougherty.

W. C. Wilson, formerly superintendent of the Meaford Mfg. Company's plant at Meaford, Ont., did not succeed in a suit against the above company for $7,000, alleged unpaid salary. The case was dismissed. Another claim of Mr. Wilson's, which had been filed against the McLagan Estate, has been withdrawn.

George F. Kretschmer, Sr., recently passed away at Louisville, Ky., after a brief illness of one week's duration. The late Mr. Kretschmer was president of the Southern Veneer Mfg. Co., of that city. He established this company in 1907, and held the position of president from its inception until his death.

Gigaire & Plante, Shawinigan Falls, P.Q., are constructing a dry kiln and office at a cost of $2,500.

The C. Beck Mfg. Co., Penetanguishene, Ont., presented that town with the grounds of the old Penetanguishene hotel, to be used for park purposes.

Canadian Cooperage Co., Limited, Moffats, N.B., was recently incorporated to take over the Canadian Fishing Transport Co., Limited, and to manufacture and deal in boxes, barrels and wooden containers; capital $50,000. F. M. Dyer and W. A. Sweet, both of New York City, and Hugh A. Carr, barrister, Campbellon, N.B., are among the incorporators.

The Everready Manufacturing Co. of Canada, Limited, Hull, Que., were recently granted a federal charter to acquire the Canadian and foreign rights of the Eveready Paper Fastener and to manufacture and deal in all kinds of office furniture and equipment; capital $200,000. Two of the incorporators are C. T. Murphy, Boston, Mass., and R. A. Upton, of Montreal.

National Household Appliances, Limited, Sackville, N.B., were recently granted a federal charter to manufacture and deal in washing machines, wringers and all kinds of household appliances; capital $400,000. J. Gueguen and E. H. Fillmore, both of Sackville, are two of the incorporators.

Star Trunk and Bag Mfg. Co., Limited, Montreal, were recently incorporated to manufacture and deal in all kinds of trunks; capital $49,000. I. Cohen and M. A. Greenblatt, both of Montreal ,are two of the incorporators.

Powley & Moody, Limited, Toronto, have been incorporated to manufacture and deal in automobiles, trucks, boats and all kinds of wooden vehicles; capital $100,000. Two of the incorporators are A. M. Dewar and A. Mills, barristers, both of Toronto.

The W. B. Pennock Co., Limited, London, Ont., was recently granted a provincial charter to manufacture and deal in automobiles, trucks, flying machines, boats and wood products of all kinds; capital $50,000. W. B. Pennock and A. R. Douglas, both of London, Ont., are two of the incorporators.

Kirsch Mfg. Co., of Canada, Limited, Woodstock, Ont., has been granted a federal charter to manufacture and deal in wooden specialties for interior decoration; capital $50,000. F. R. Buck and D. W. Hoxie, both of Sturgis, Mich., are two of the incorporators.

Lyons Bros., Toronto, who fitted up a woodworking plant some time ago, have now a complete installation devoted exclusively to the production of boxes for storage batteries. The wood used is chiefly oak and a very high quality of workmanship is required, as accuracy is a prime essential.

J. B. Morin, Limited, East Angus, Que., was recently incorporated to manufacture and deal in carriages, furniture, boats and wood products of all descriptions; capital $99,000. Two of the incorporators are J. J. Morin and F. Roberge, both of East Angus, Que.

V. G. Mongeau, Limited, St. Hyacinthe, Que., have been incorporated to manufacture and deal in coffins, caskets and boxes; capital, $30,000. J. Surprenant and L. Barceloux, both of St. Hyacinthe, are two of the incorporators.

At the annual meeting of the Peterborough Branch of the Engineering Institute of Canada, part of the entertainment consisted of moving pictures showing the various operations made in producing the ordinary barrel, the subject being covered from the felling of the trees to the assembling of the finished product.

Mr. Ramsden, Toronto representative of the Midland Woodworkers, Limited, Midland, Ont., has moved his office from 129 Spadina Ave., to 243 Pacific Avenue.

W. E. Harris Mfg. Co., Toronto, who were recently organized to manufacture and deal in sectional houses, have contracted with the Watt Milling & Feed Co. for a steady supply of sectional houses. It is anticipated that this business will assume large proportions.

Watt Milling & Feed Co., Limited, Toronto, recently completed a two-storey frame factory 40 x 110 feet. This was built to take care of the sectional

Three Questions—

could you answer them?

Do you ever consult your banker—Most likely—Then suppose your banker, for instance, asked you these three questions—could you answer them? Try it!

1. *How many hours of labor do you purchase each month?*
2. *How many were productive hours?*
3. *Are the records of your purchased and productive hours printed and unchangeable.*

They may be, and probably are, pertinent questions, and on them may rest the success or failure of an organization—yours perhaps.

If you can answer these three questions by the simple reference to records that are printed and unchangeable, you have complete control over what is today the costliest item of production—labor.

International Time Recorders and International Job Time Recorders give you the answers to these vital questions any time you care to refer to them for any month, any week, any day in the year. And those records are convincing too, because they cannot be changed.

We have a time recording system that will give you accurate information on the labor costs of your factory. A short talk with one of our representatives or some of our literature may prove of great value to you. No obligation attached to either—just say which.

International Business Machines SPEED ACCURACY ECONOMY

Also manufacturers of International Dayton Scales and International Electric Tabulators

house contract recently entered into with the W. E. Harris Mfg. Co. The material for these houses will be milled in the plant and carried to the new assembling building by an overhead carrier system. Here the different sections will be nailed up in forms so as to insure uniformity. Several new machines were added, in the shape of a horizontal boring machine and a Cowan variety saw, to take care of this work. These were supplied by the A. R. William Machinery Co., Toronto. If the demand warrants it, the output of sectional houses can be brought up to 25 buildings a week.

Maguire, Paterson & Palmer, Limited, have decided to instal match-making machinery in their splint factory at Pembroke. This is only a temporary measure to enable them to carry on until their plans for the construction of a large match factory are completed, the site chosen and the new factory put in operation.

The Northern Woodworkers, Limited, Bathurst, N.B., were recently incorporated to manufacture and deal in wood products of all kinds and take over the woodworking factory operated by Archibald E. Chapman, capital $24,900. A. A. Chapman, John McIntosh and Stewart Chapman, of Bathurst, N.B., are among the incorporators.

H. J. Atcheson has opened up a cabinet-making and general woodworking shop at 2256 Queen St. East, Toronto.

The Montreal Pattern Works, 242 Clarke St., Montreal, was recently reorganized. A. E. Porteous is now the business manager and John S. Grant, secretary. This firm does a general wookworking business as well as makes patterns in both wood and metal.

The Stratford Housing Company, Limited, of which D. N. Wright, managing-director of the McLagan Furniture Co., is president, contemplate erecting fifty houses. The plans for these residences have been prepared, and are being submitted to the provincial director for approval. It is anticipated that tenders will be called for and the work undertaken in the near future.

A unique building event took place in Weston, Ont., just outside Toronto, recently, in which four houses were completed in a single day. A start was made at 6 a.m., and by 11 a.m. the four buildings were complete. The builders were A. E. LePage, bungalow specialist, Toronto, The Brantford Sectional House Co., which is connected with Schultz Bros. & Co., Brantford, Ont., the Harris Ready Cut House Co., Toronto, and Carl Seymour, Toronto.

Henry McKenna recently passed away at his home at Elora, Ont. Mr. McKenna was an upholsterer by tarde, and was with Morlock Bros. for a number of years. More recently he was in the employ of the John C. Mundell Co., Elora.

A recent ruling of the Department of Agriculture is to the effect that the standard berry box must be used this year. This means that the use of the smaller box which has been on the market during recent years will not be legal under the present ruling.

The manufacturers of British Columbia contemplate holding a Made-in-B. C. Week from June 20th to 25th inclusive. The co-operation of practically all manufacturers has been secured, together with the support of various boards of trade and other societies, and it is thought that this movement will succeed in boosting B. C. products.

Mr. R. B. Morley, general manager and secretary-treasurer of the Ontario Safety League for the past seven years, has resigned his position to become secretary-treasurer of the Industrial Accident Prevention Association, an organization formed under the authority of the Workmen's Compensation Act. Mr. J. F. H. Wyse, formerly organizer and engineer of the Safety League, has been appointed to fill the vacancy caused by Mr. Morley's resignation. The executive committee of the Safety League has made Mr. Morley honorary secretary.

Appointed Canadian Distributing Agents

The veneer and panel plant at Waterville, P.Q., which was recently equipped by the Waterville Veneer & Panel Co., is now in operation. The machines installed in this factory are the latest known to the veneer manufacturing industry, and as a consequence a high quality product should result. The output consists of rotary cut veneers in birch, basswood, maple, etc., and built-up panels faced with any of the better known cabinet woods, such as oak, walnut, gum, birch, etc. This material can be had in stock sizes or made to special dimensions. A line of cheaper plywood for case backs and drawer bottoms is being turned out.

Robert Bury & Co., Limited, Toronto, have been appointed special distributing agents for this line in Canada, and will handle all the Canadian business. This leaves the Waterville organization free to devote their full attention to manufacturing.

Once upon a time

Why our Gum does not stain

Gumwood was despised; considered a cheap unreliable wood. Today its use predominates in the higher grade manufactures and crafts.

What has brought about this change?

Intrinsic merit partly, but **improved methods of production, handling and treatment are the important contributing factors.**

True, some manufacturers, attracted by low prices on an inferior product of Gumwood, lacking the necessary care and attention in handling and treatment, continue having some difficulty, but this is **unnecessary and tremendously expensive.**

The **right kind of Gumwood** offers to the purchaser the greatest value for the money expended of any wood on the market.

The price of the best is so low—intrinsic value considered—that it is folly to be tempted by a slightly lower price on inferior stock.

The lowest intial cost invariably means a higher ultimate cost. **It is the ultimate cost that determines value.**

Our Kraetzer-Cured Gumwood represents the acme of quality and dependability: as straight and flat as any wood, and bright, free from the stain and discoloration, which many people think must be expected in the sap part of Gumwood.

And uniform—one board like another; one car like another. These things can be accomplished by **no other means** and obtained from **no other source.**

Only the very rich can afford the extravagance of poor quality. Every board is branded.

One reason why our Gum is Straight and Flat

Sunken Joints in Furniture Panels

The use of heavy and light material of the same species in laminated or glued-up wood construction has less injurious effect than has been generally supposed. Laminated wood specimens under observation at the Forest Products Laboratory show little weakening or tendency to warp from this cause. Most warping and checking in laminated construction can be traced to one of two causes. The first is the use of plain-sawed and quarter-sawed lumber in the same construction, and the second is the combination of material of different moisture content.

Plain-sawed lumber of any species shrinks and swells more than quarter-sawed lumber; and when the two kinds are glued together, they pull against each other with every change in moisture content. If the block containing such a combination is kept for a long time in the same atmospheric condition, the stresses die out, because the block checks or changes tured, the stresses will disappear permanently in time, but the block will have changed its shape someshape more or less to relieve the stretched condition of its fibers. As soon as the atmospheric conditions change, new stresses will be set up.

If boards of different moisture contents are glued together, internal stresses will result from the unequal shrinkage of the boards as their moisture contents equalize through seasoning. In some blocks made at the laboratory these stresses were large enough to rupture the wood. If the wood is not ruphat in getting rid of them.

Stresses in Laminated Construction

A defect in manufacture known as a sunken joint is sometimes noticeable in thick panels, especially tops of tables, desks, and other pieces of furniture. This defect appears as a long, shallow depression in the surface, and may be very conspicuous when viewed at certain angles.

In modern practice furniture tops are generally built up of five plies of wood, consisting of a thick core, cross banding, and faces. The core is usually made of a number of pieces of lumber glued together. Investigation shows that the defect in question occurs over joints in the core stock.

The Forest Products Laboratory finds that too rapid progress in the preparation of the core is the basic cause of sunken joints. The wood next the joint absorbs moisture from the glue and swells. If insufficient time is allowed between the gluing of the joints and surfacing of the core, which is the next step in manufacture, more wood will be removed at the joints, because of the greater swelling there than at intermediate points. During subsequent drying and seasoning, greater shrinkage takes place at the joints, causing permanent depressions.

The remedy for sunken joints is an extension of the seasoning period between gluing and planing. The proper length of this period will vary with the thickness and species of wood, and atmospheric conditions, but it should be long enough to allow the moisture added by the glue to evaporate or to distribute itself through the wood.

The Sidman Lumber Curing Kiln

We have read with interest an article in the May WOODWORKER by MR BENJ D. CURTIS, on the necessity of even distribution of heat in a Dry Kiln to properly dry lumber.

This is one of the points that has made THE **SIDMAN LUMBER CURING KILN the SUCCESS IT IS.** You will note that the pipe works shown to illustrate the article, are all bunched in the bottom of the kiln, with practically no difference as to the diffusion of heat, simply of different design.

Our heating pipes are arranged part way up on each side wall, and in Class D (Pocket) Kilns across the back wall, then drop, and the pipes are run to the front of the kiln under the lumber just below the rails. We also take care of the COLD END or ENDS that are covered by the door or curtain, by a special arrangement of our piping, something that is not done by others, so that each and every part of our kiln will show the same degree of heat at all times. Our heating system is automatically controlled by the way the radiation is laid out, and this even distribution of heat combined with our POSITIVE CROSS VERTICAL SYSTEM OF VENTILATION, can not fail to give the best results so far obtainable, in drying lumber properly. Where various degrees of temperature are desired, we use a special Thermostat.

Write us for the nearest user of our kiln, go and see the kiln and talk to the owner.

ALL SIDMAN KILNS ARE MADE IN CANADA. NO LONG HAUL FREIGHT CHARGES, DUTY, OR EXCHANGE ON MONEY TO PAY.

Road Construction in Fukien Province

The military governor of Fukien Province, China recently commenced the construction of modern roads between Yungchun and Chuanchun, Huyang, and Tehu. The roads are being constructed of macadam with a width of 40 feet in the towns and of 25 feet in the country. The actual construction work is being done by Chinese engineers who have had experience in Singapore. It is planned to run a motor omnibus and freight service on the roads when completed.

Brick Makers and Government Bureau to Study Brick

Negotiations are in progress looking to a co-operative agreement between four associations of brick manufacturers and the U. S. Bureau of Mines and the U. S. Bureau of Standards. The plan is to make a comprehensive study of certain of the fundamental problems in ceramics which are confronting the manufacturers of brick. A substantial sum is to be made available for that purpose.

Highway Work in Oregon

In the biennial report of the Oregon State Highway Department it is recommended that the activities of the department in 1921 be confined to the improvement of roads already embraced in the present system of state highways. The report shows that the state system of highways includes 20 routes with a total mileage of 2,976 mi., exclusive of sections included in cities and towns. Of this total, 1,944 mi. are improved.

INVESTIGATE IMMEDIATELY

We warrant the following used and rebuilt Wood Working Machines.

1 Woods 15 X 6" Planer & Matcher.
1 MacGregor 26 X 8" Double Surfacer.
1 Yates 30 X 6" Double Surfacer (rebuilt)
1 Smith 8" Sticker.
1 Cordesman Band Rip Saw.
1 Yates No. 156—27" Surfacer (rebuilt)
1 RogersNo. 6 R.H. Saw Sharpener (new)
1 Black Diamond No. 1 Saw Filer (new)
1 Ballantyne Self Feed Rip Saw
1 Jackson Cochrane 3 Drum Sander
1 MacGregor Mortiser
1 C.M.C. Sash Moulder 6"
1 C.M.C. 12" Buzz Planer
1 MacGregor Tenoner

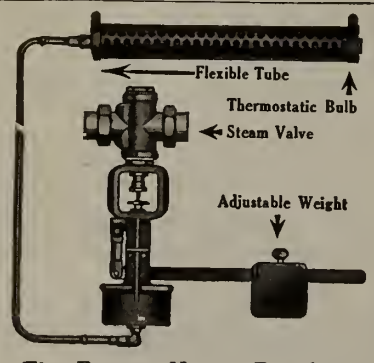
Strike!



The Powers No. 15 Regulator

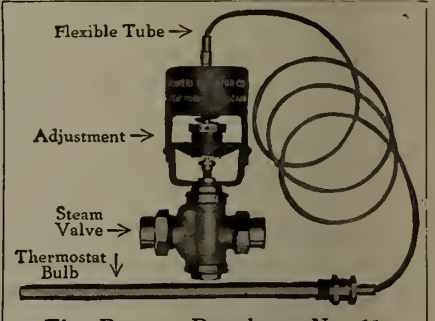
Here is a regulator that will control your dry kiln, or your varnish room, or other similar process, saving fuel and improving product.
Send for Bulletin 138.

Responsibility is irksome to some men—routine to others.

Automatic control of temperatures relieves men of both responsibility and routine—it helps to relieve the "spirit or unrest," which seldom occurs where tasks are not irksome.

Some of the Causes!

Begin now to eliminate some of the causes of discontent by putting Automatic Heat Regulators on your dry kilns, ovens, varnish and dry rooms, heating systems, hot water tanks, shower baths—and every place where heat control is desired.



The Powers Regulator No. 11

Specially adapted for the control of liquid temperatures as in hot water tanks, glue pots, dry kettles, etc. Entirely automatic and self contained requiring no outside power for operation.
Send for Bulletin No. 129.
other designs for other uses, wherever heat control is desirable.

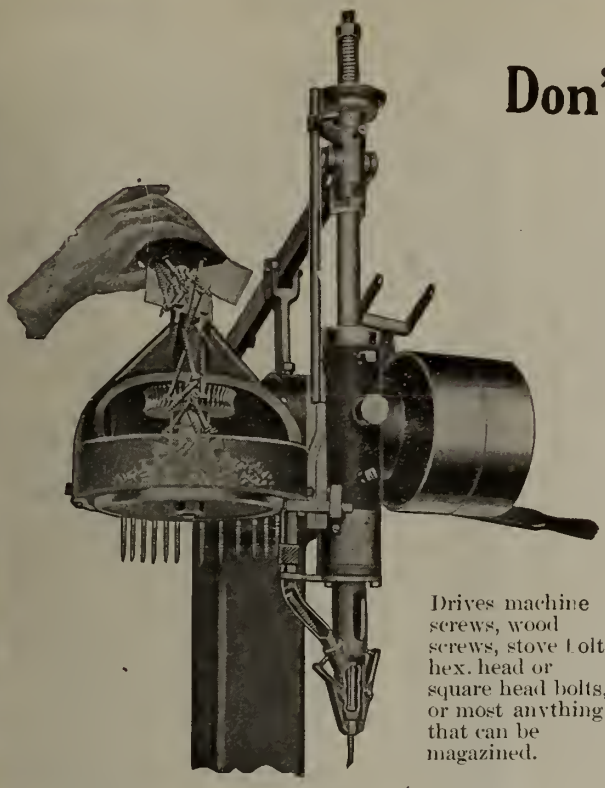
Powers Heat Regulators

These accurate, dependable machines positively and automatically control the heat at the point of use. Their economy is fourfold.

1. They save labor by releasing men who now attempt to control heat by hand.
2. They save material by preventing losses from spoiled or sub-standard output.
3. They save fixtures by preventing overheating.
4. They save fuel by using only necessary heat.

We have spent more than thirty years in studying temperature control and have gained a vast fund of practical information which is cheerfully at your service.

The Canadian Powers Regulator Co., Ltd. SPECIALISTS IN AUTOMATIC HEAT CONTROL **82 Chestnut St., Toronto, Ont.**



Drives machine screws, wood screws, stove bolts, hex. head or square head bolts, or most anything that can be magazined.

Don't waste time and money driving screws by hand

Follow the example of your competitors and install Magazine Fed Screw Driving Machines

The
Reynolds Machine Co.
Department C.
Massillon, Ohio, U. S. A.

Robertson Patented Socket Head Wood Screws

Take the *high costs* out of Screw - driving

No matter whether you use automatic screw-driving machines or the hand method, you will find them far superior to work with.
Note the patented recess head as shown in the illustration. When the driver is set in it there is no chance of it slipping out and all burring is eliminated. The result is a clean, neat-appearing job that adds to the value of your product.

Many manufacturers are now using them exclusively and are all delighted with the results. **Drivers supplied free with first orders, and include** hand drivers, Yankee bits, brace bits or bits for the Reynolds machine, which gives exceptional efficiency when using recessed head screws. Send post card for free samples with bits which will prove our contention of double efficiency and savings in time, labor and annoyance, worth more to a large screw user than his entire outlay in buying screws.

"The Canada Lumberman" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free duscussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements. Sample copy and full information on request. Head Office, 349 Adelaide St. West, Toronto.

There is supreme satisfaction in Garnet Cloth and Paper you can believe in - which you know will run true and smooth, giving a finish that every good workman demands.

Carborundum Brand Garnet Paper and Cloth

are made of the very best material coated with North River Garnet which cuts fast and uniform.

A complete stock of sheets and rolls in all standard widths and grades carried here.

NORMAN MACDONALD
62-64 Temperence Street TORONTO ONT

Carborundum Brand Garnet Paper and Cloth

Will Help Your Product, Your Production and Your Profits

IT is simply because Carborundum Brand Garnet Products are so carefully made of the highest possible quality of materials. Every inch of the paper and cloth is uniformly coated with the hardest, sharpest, cleanest of North River Garnet.

The surface isn't dense. It is open, free cutting. The grains get a real chance to cut and carry away the removed stock.

There is little or no chance of the surface filling. Another point in favor of Carborundum Brand is the flexibility of the paper and cloth.

It won't crack or peel on the sander roll—not even when you work it over sharp angles.

A test in your plant will complete the story of the high efficiency of Carborundum Brand Garnet Products

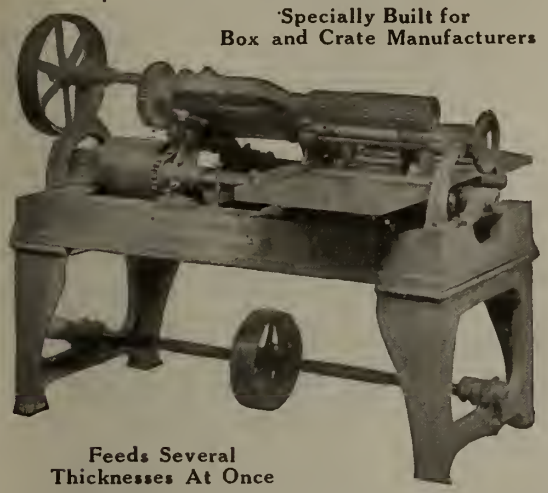
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

SIMONDS
CIRCULAR AND BAND
SAWS

In every mill or woodworking shop in the land the demand for greater production is urgent. Devious methods to secure the desired results are being tried out. Some are making good—some are not. They have the manpower, but they can't get production. Many mills and woodworking shops have discovered one of the greatest hindrances to efficient operation are poor saws and knives. The saws dull easily and do not hold their tension, while the knives lose their cutting-edge quickly and this results in unsightly marks on the lumber, and consequently damage.

Inferior saws and knives are being discarded by many, and in most cases Simonds Products are replacing them. There is no question about Simonds Saws and Knives. They are made of the finest steel obtainable, hardened and tempered right and make mechanically perfect. They produce smooth lumber and cut down your operating expense.

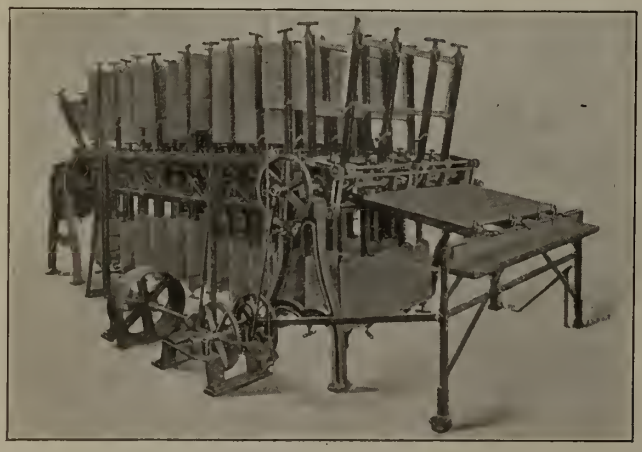
One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier



For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.

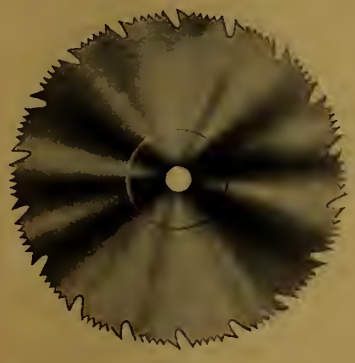
ATKINS

STERLING QUALITY

SAWS and KNIVES



The best steel—the most careful and accurate workmanship—the equipment that will eventually save you money.

Atkins Sterling Quality Saws and Knives are proving their superiority by competitive tests in the largest plants of the country. We welcome your most careful investigation, as we know the satisfaction that will result.

Write to-day for our Knife Booklet "C W" and Pattern Template Paper.

E. C. ATKINS & CO.

Makers of Sterling Saws

Factory—HAMILTON, Ont. **Vancouver Branch—109 Powell Street**

"176" in factory of Western Furniture Company, Indianapolis, sanding inside curved edge of a circular cabinet panel against solid sanding roll. The curved frames on the trucks are similarly finished at a very considerable saving over other methods.

MATTISON

176

Oscillating Belt Sander

For Edge and Shaped Work

Successfully employs stationary forms

This shows a narrow-nosed form which provides an accurate and economical method for sanding the curved and flat members of both square and octagonal pieces. The sanding is done with the grain, and the stock is handled but once.

BECAUSE of its substantial construction, this sander is entirely free from vibration, making the use of special forms completely successful.

This feature provides a superior method for sanding the small, flat curves of ornamental square or octagon legs, pilasters, etc. The work is accomplished quickly, accurately and economically. Oscillation of the sandbelt improves quality by eliminating scratch marks.

Such a large variety of flat and curved edge work can be completely finished on this Oscillating Belt Sander, that no furniture factory can afford to do without it.

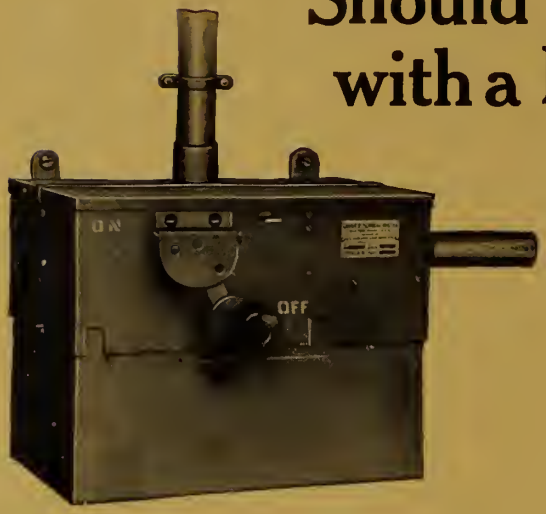
CONDIT

No Power Circuit Should be Broken with a Knife Switch



Condit Type N-2 Oil Switch

Condit Type 1 Oil Starter

By using Condit Oil Starters and small industrial Oil Switches to protect small motors and small power and lighting circuits in woodworking plants, the fire hazard is eliminated and many delays caused by trouble with small motors not properly protected, is avoided. When a circuit is opened, the arc is under oil which immediately extinguishes it. Thus, serious trouble very often caused by knife switch blades burning in ways which prevent proper contact and allowing a three phase motor to operate on single phase, is obviated.

EXTREMELY WELL PLEASED

That's what you would say if you had a Yates 431 Endless Bed Sander in your plant. A customer wrote us who is considering installing another 431 and said:

"We have been extremely well pleased with the service which your 431 Sander has given us. As a matter of fact, it has been so thoroughly satisfactory that we are not considering, on this proposition, any other machine than your own."

What better recommendation could you want?

Our new 60-page Sander Book, fully illustrated, with a fund of information on sanding, is just completed. Get a copy.

R. LAIDLAW LUMBER CO., LIMITED
65 YONGE STREET
TORONTO, CANADA. June 20th, 1921.

The Toronto Blower Co.,
156 Duke Street,
T O R O N T O.

Gentlemen-

With reference to the Blower System recently installed by you at our plant, 2280 Dundas Street West, and which we have been operating now for nearly a year.

We have pleasure in stating that the system is working most satisfactorily; so much so, that although it necessitated the installation of a 55r Foster By-Pass double fan, we are operating both new and old fan with less power than used to handle the old one. This is, without doubt, due to the efficient way in which you laid out the job, thereby cutting down back pressure.

The work has a very pleasing appearance and was executed very mechanically and without unduly interfering with our operation.

Yours very truly,

The Proof -- of the Pudding

This plant is described on Page 81 of March Issue of The Canadian Woodworker & Furniture Manufaeturer.

We are Specialists

We design, install and guarantee our systems from the making of the fan right down to the finest detail of installation.

IT'S JUST LIKE THROWING MONEY AWAY

To Use an Inefficient and Unreliable BELT

STOP IT!

You Can SAVE MONEY By Using

D. K. McLaren's Genuine British OAK TANNED Leather Belting

SOMETIMES you hear a man complain that belting is expensive. Investigate and you will invariably find that he has never used a really worthwhile belt—his has been of the cheaper grade, continually stretching, breaking, losing power and causing frequent break-downs.

Belting of that type is, and always will be expensive. Belting costs cannot be figured by the price-tag, but by the ultimate service the belt will render.

Fortunately, most woodworkers know the truth of this so that good belting is the rule and not the exception in the average plant. And it is a significant fact that with the busiest and most progressive of these, D. K. McLAREN'S GENUINE BRITISH OAK TANNED BELTING is the kind used. Our organization is at the service of belting users everywhere to advise them in the selection of the right belt. Can we be of service to you?

Robertson Patented Socket Head Wood Screws

Take the *high costs* out of Screw - driving

No matter whether you use automatic screw-driving machines or the hand method, you will find them far superior to work with.
Note the patented recess head as shown in the illustration. When the driver is set in it there is no chance of it slipping out and all burring is eliminated. The result is a clean, neat-appearing job that adds to the value of your product.

Many manufacturers are now using them exclusively and are all delighted with the results. **Drivers supplied free with first orders, and include** hand drivers, Yankee bits, brace bits or bits for the Reynolds machine, which gives exceptional efficiency when using recessed head screws. Send post card for free samples with bits which will prove our contention of double efficiency and savings in time, labor and annoyance, worth more to a large screw user than his entire outlay in buying screws.

Machinery Company, Ltd.
ONTARIO

We are the Sole Manufacturers and Agents in Canada of the Eaglesfield Patented Beltless Swing Saw—See advertisement page 12.

Eaglesfield "BELTLESS" SWING SAW

Announcing——

A new design with special high-torque small-diameter

MOTOR DIRECT ON ARBOR

In addition to the present type of EAGLESFIELD BELTLESS SWING SAW, motor gear-connected, which was put on the market in 1919, we now announce a new design, with motor mounted directly on 2-in. spindle—gears entirely eliminated.

With ample power for saws up to 24-in., this new design permits a range of cutting from the small shop requirements up to heavy-duty service in car shops and saw mills.

Motor connection takes up only 3½ in. of saw, leaving ample clearance—as on a 24-in. saw, 8¼-in. cutting surface is available. Saw can be trammed for more accurate cutting than you have been accustomed to.

The unified hanger construction, resilient spring action, and the 7-in. section column are identical with the gear-head machine.

Motor is of the enclosed, built-in type, 25 or 60-cycle, 2 or 3 phase, any voltage. Extra large size S K F ball bearings. Saw up to 24-in. included in equipment.

Made in Canada

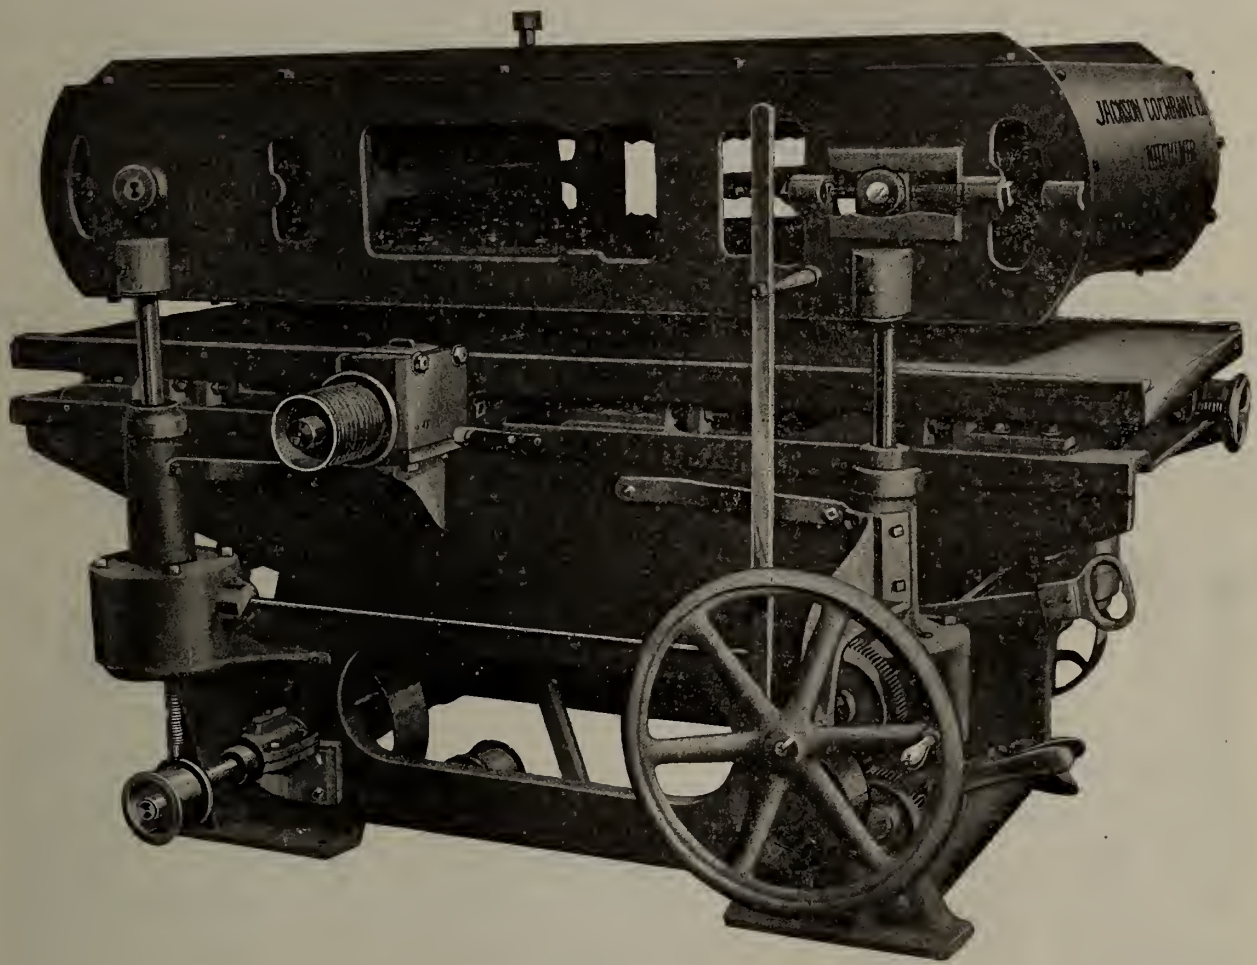
The

Herzog Self-Feed Jointer

means

Increased Production **Simplicity of Operation**
Small Floor Space **Safety to Employees**

Does four times the work of the Hand Jointer



Our No. 34 Herzog Jointer, illustrated above, is one of the most efficient machines on the market to-day. It is appreciated by the manufacturer and employees alike, because, while it will produce from three to five times as much work as the hand jointer, it does not require skilled operators, but eliminates the danger so common to other makes. It can be operated by two boys. It will handle stock varying in width from 1 inch to the full width of the jointer, will feed fast or slow, takes only one-fourth the floor space of hand jointers, and requires only one-fifth of the sharpening of the knives. It is fitted with power feed raising and lowering attachment, with cylinder double belted and driven from both ends.

If interested in reducing your costs, write us

Jackson, Cochrane & Company

KITCHENER - CANADA

The Shimer Round Safety Cylinder with High Speed Knives

A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

Know Your Exact Output

The **Productimeter** is a real meter of production. It is **always dependable,** always on the job, and never forgets to tally.

Can be used on such machines as moulders, stickers, flooring machines, and self feed saws.

Built substantially to withstand the hard usage it is liable to receive.

Gives you the **absolutely correct** total of work that goes through. Its visibility, alone, is an important factor in spurring your workmen to greater efforts.

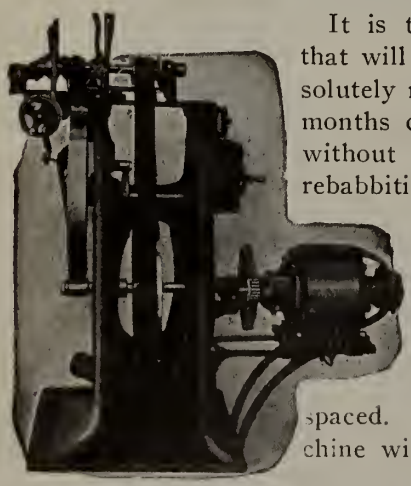
Our faith in the **Productimeter** is such that we will send you one for a thirty days' trial. If it doesn't make good, send it back in good order, and we'll cancel the charge.

Durant Manufacturing Co.
615 Buffum St. Milwaukee, Wis.

The Berry Combination Band and Circular Automatic Saw Sharpener

Belt or Motor Driven. Capacity: Bands, 3-16" to 4", Circulars 4" to 32". Simple, Universal, Automatic in Action.

It is the only *combination* grinder that is *automatic*



It is the only grinder that will grind a saw absolutely round after three months continuous use—without readjustment or rebabbiting. It will take an unevenly spaced, hand-filed saw and make it perfectly round and even spaced. No other machine will do this.

For All Shops Using Circular or Band Saws

The Berry Tooth is far superior to the ordinary peg tooth. All teeth are alike, evenly spaced—ground right from the center. A saw ground with this machine does twice the work in half the time.

Write for Booklet to-day.

The Handiest Machine on the Market

The Split-tilting table (Patent Applied For) can be tilted and locked at any angle up to forty-five degrees as indicated on the graduated segment. This machine is also supplied with a solid table. The Boring Attachment is very complete in itself. A foot lever is connected with the table which slides back and forth on the knee. A large coil spring located in the column of the machine automatically releases the work from the bit when pressure is removed from the foot lever. The Boring Attachment is raised or lowered by means of a handwheel connected with a pair of mitre gears. The spindle is bored to take standard size bits and can be arranged for a hollow chisel mortiser. Special cutters may be used by removing the throat in the table. Each machine is furnished with one ten inch saw, belt and wrench.

Write for prices and pamphlet describing this time and labor saver more fully.

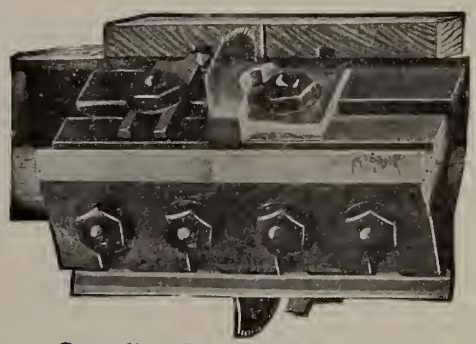
The Shuff Sticker Saw Head Attachment



Canadian Patent No 212337

This attachment will double your moulder production, widening its range of performance and effecting a real saving in the running of pully stiles, blind stops, cove, parting stops, window stops, fillet, glass bead, base moulding, ceiling, lattice moulding, screen moulding, base shoe, quarter round, stools, panel moulding, etc. Used for splitting moulding when two or more are run at the same time, a decided improvement over the flat knives for this purpose ; also used for rabbeting and grooving.

The attachments are furnished in pairs of rights and lefts, are made of solid brass, each pair properly balanced and saws sharpened and set before shipment. Made in all sizes to fit any moulder. When ordering send sketch of end view of sticker head. Cut smooth and are easily set up. Price $30, 00 in American funds f.o.b. Waukesha, Wis.

Manufactured by

JOHN SHUFF P.O. Box 45, 145 Barston St. Waukesha, Wis.

An Efemco Product

For Every Metal Bed

It's an Efemco caster—a new one—and that's recommendation enough. Note the groove in the bottom leaves of the spring. The leaves come together when the spring is pushed into tube—thus giving added rigidity of contact and forming a bearing in which the stem turns freely. The top of stem is swedged—no danger of caster dropping out. Secure, rigid grip in either round or square tube.

We also supply this caster in the ball—or roller bearing types. Up to 1½ in. size it is finished with cupped washers. Above that size with leg mounts.

When ordering please specify maple, lignum-vitae, steel, iron or fibre wheels.

Write for catalog showing new lines of improved **Efemco** Casters.

Gentlemen:-

We are in receipt of your cheque for $24,-
537.50 which covers your portion of the loss at
Laforest. We are also enclosing Policy No. 13502.

We wish to thank you for your exceptionally
prompt attention in handling this loss as the fire took
place on May 10th, was adjusted on May 17th, and
your cheque was received here on May 20th, which, so
far as we know, is almost a record in fire adjustment.

We can assure you that your promptness is
appreciated and that you will get a reasonable share
of our business in the future.

Thanking you, we are

Yours truly,
(Signed) H. G. McDermid
Secretry-Treasurer.

HGM-B

The above letter speaks for itself and, as usual, our check was the first received

We are not the largest fire insurance organization in the world, nor are we the oldest, but we have the strength of the strongest and our check is always first.

HERE IS OUR RECORD. In the past two years there have been sixteen heavy fire losses and with all the different forms of insurance mediums interested, in fourteen cases our check was first, the other two cases it was second.

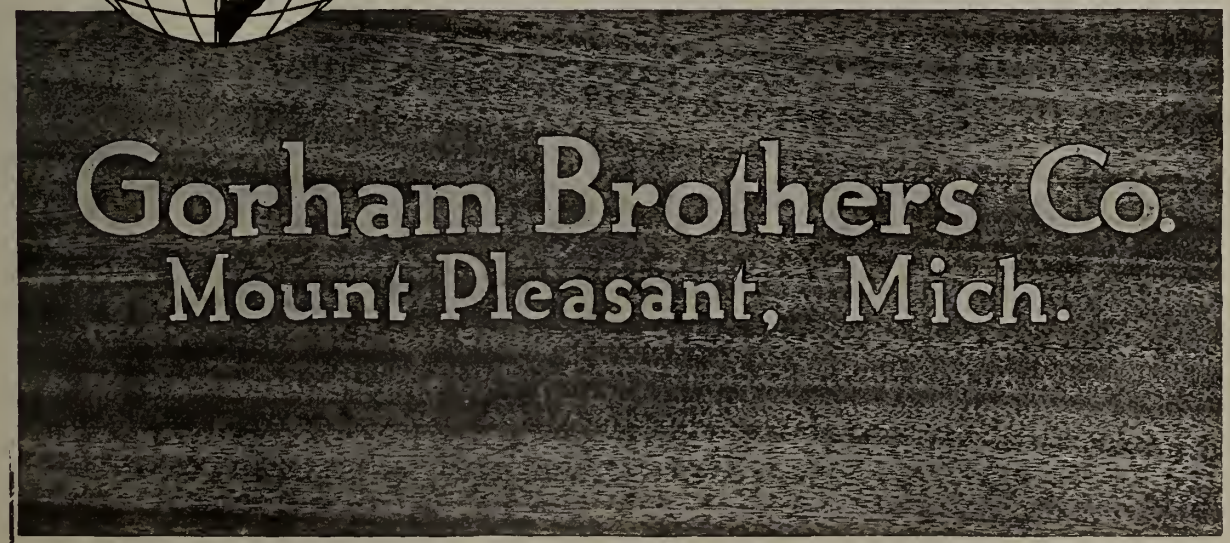
GORHAM PLYWOOD

is well and favorably known in Canada as well as the States and its use in the form of Tops, Drawer Fronts, End Panels etc., in your product, will be a long step in securing the confidence of your customers which will result in orders and re-orders.

Our trademark is stamped on the back of every Top and Panel we make. Our guarantee that it is right and will stay right.



The Door Carrier System

Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.
Ask for catalogue.

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS ALL WALNUT"

AMERICAN WALNUT

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS ALL WALNUT"

"The Cabinet-wood Superlative."

"IS THIS ALL WALNUT?"

Steadily increasing numbers of American Walnut furniture buyers are asking dealers this question.

This Association desires to help furniture manufacturers and distributors to profit in this development of the public's buying power by passing along such authentic information as the above for mutual benefit.

By making your Walnut pieces *ALL WALNUT* you can insure profits for maker and dealer, and also "*Give the Public What it Asks For.*"

In all our National advertising in the general magazines appears this significant phrase:

"BE SURE YOUR WALNUT IS ALL WALNUT"

AMERICAN WALNUT MANUFACTURERS' ASSOCIATION

ROOM 1019 616 SOUTH MICHIGAN BOULEVARD CHICAGO

Reese Sheriff Lumber Co.

WILLIAMSPORT, PENNSYLVANIA

Manufacturers of

Northern and Southern Hardwoods White Pine, Spruce and Hemlock

With special attention to **Oak, Chestnut, Poplar, Cherry, Walnut, Gum and Basswood.**

OUR MOTTO

REASONABLE PRICES - that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

TO MEET COMPETITION

It will be necessary to put better lumber into your product. Indiana Oak is known to be the best. It costs no more than the other kinds—then why not get it?

We are the largest manufacturers of hardwoods in Indiana and give you below a partial list of the stock that we have ready for shipment:

INIDIANA QUARTERED WHITE OAK

WE ARE IN POSITION TO KILN DRY THIS LUMBER. ASK FOR OUR RATES.

We also have good stocks of Poplar, Ash, Beech, Hickory, Maple, Gum, Tupelo, etc.—Write us for prices.

Maley & Wertz Lumber Company

EVANSVILLE, INDIANA

We guarantee that our Walnut Lumber after having been steamed in our Steam Kilns for four days, then placed on sticks for six days, during fair weather, can be placed in your Dry Kilns immediately and dried with greater safety than unsteamed lumber, green from the saw and placed on sticks for ninety days. This method of steaming lumber enables us to furnish material without delay.

QUALITY

SERVICE

Full loaded capacity of nine kilns, 100,000 feet.

American Walnut Lumber

All grades and thicknesses

Pickrel Walnut Company

St. Louis, Missouri

Stimson Veneer and Lumber Co.

"What Others Say"

"Your letter of February 15th received and we want to say that this was a very nice lot of lumber. It was good widths and lengths and well manufactured, dry stock and the grading was very liberal. We are sorry we cannot use more of this lumber at the present time. *We received several cars from other manufacturers at a cheaper price but the lumber was not nearly as satisfactory.* When we are in need of more stock we will take the matter up with you."

(Note—The above was sent us February 24, 1921 unsolicited. Name given on application).

UP FROM THE TROPICS SUPREME AMONG WOODS

MAHOGANY

Tabasco, Laguna, Honduras and Mexican Mahogany

Out from the tropical interior, along steaming jungle paths and down long rivers to the sea, the history of OTIS mahogany can be traced. Virgin forests yield their treasures to the enterprising white man and natives do his bidding as he seeks and hews the timber so valued in the north land. Thus mahogany in quantities to satisfy the largest buyer comes to our yards. Twelve million feet per year is our capacity, and assures you of prompt service. Write for our prices to-day.

DIMENSION STOCK
From SOUTHERN HARDWOOD LUMBER

OUR CAIRO, ILL., PLANT LARGEST IN OPERATION
Exclusively engaged in the manufacture of DIMENSION STOCK (Kiln Dried or Air Dried)

Dimension Lumber Kiln Dried Means:

1. The elimination of waste.
2. A saving of at least 40% in freight.
3. Lumber delivered at the woodworker's plant ready for immediate use.
4. A quick turnover and minimum investment in lumber.

The benefits to be derived from the use of Chicago Mill Dimension Lumber are cumulative. In the long run it means lower production cost for the finished article.

Vol. 21 Toronto, July, 1921 No. 7

Preparing For Better Business

The furniture manufacturers of Canada are taking advantage of the usual midsummer lull to prepare for the improved conditions which they believe they will face early in the fall. At the present time the semi-annual price lists are being distributed among the trade. These new prices have been carefully figured at present replacement values, and as the overhead or burden was based on normal productiveness, they represent the lowest prices permissable under existing conditions. The reductions vary with the different lines, some showing a drop of 15 per cent. over the prices found in the March lists. Taken on the average, the wholesale price of furniture has eased off about 30 per cent. from the peak of 1920.

A new departure—one that should have a very beneficial effect—is to be found in the guaranteeing of the quotations presented in the July lists against a decline for a period of six months, or until the end of the year. The manufacturers were practically unanimous in their willingness to take this step. This means that the retailer can depend that the new values will prevail for the balance of the year. The effect of this should be to restore the confidence of the furniture dealers and cause them to enter the market and buy on something more nearly approaching a normal basis. Trade has suffered for the lack of a steadying influence, and it is thought that this price guarantee will have the desired result.

In the retail field the demand for furniture was held up in a very gratifying manner. Some of the furniture merchants report that the volume of business for the first six months of 1921 was equal to that for the corresponding period of 1920, and in a few instances 1921 shows a slight increase. In view of this, one may wonder why the manufacturing end of the industry is suffering from a lack of orders, so much so that production is away below normal. Two explanations are given for this state of affairs; one is that the dealers were over-stocked at the beginning of the year and have been busily engaged in reducing this surplus, and the other is that owing to the general air of uncertainty so prevalent in industrial and commercial circles, they have permitted their stock to become badly depleted. In view of this it is difficult to see how the dealers can remain out of the market for any prolonged period. It is hoped that the guarantee which is embodied in the new lists, together with the fact that prices have been cut to the last notch, will convince them that the present is a good time in which to commence buying, on a moderate scale at least.

In figuring overhead on a normal basis, the furniture men have fallen in line with the suggestions offered by different well-known business experts. When business is good and production above normal, the overhead is low. As the demand drops and production declines, the overhead mounts. By figuring the burden on a normal production basis, a surplus would be built up during good times that would take care of the deficit which would accrue when production is low. The result would tend toward normal business, for prices would not show such a wide variation from time to time.

In the present instance the furniture manufacturers who are operating below normal are taking a loss on their overhead account, which will in some instances wipe out all profit on the sales made. In the long run the effect cannot help but be beneficial to all concerned, as it will tend to stabilize values at practically a normal level, resulting in a normal resumption of business.

The opinion is held by many manufacturers that before the six months' guarantee period has passed furniture values will tend to stiffen. Prices of certain grades of lumber are showing signs of firming ,while glass is on the upward trend. In the glass industry all indications point to higher values. As furniture prices are based on rock bottom costs, with profits shaved to the last cent and all material figured at replacement values, any increases which may take place in the raw material market must be reflected in the sales price. The guarantee against further decline does not prevent prices being increased during the period covered, if found necessary.

One reason why the retail business has held up so well is that the publicity efforts of the bedding manufacturers, as exemplified by Simmons, Limited, the Gold Medal Furniture Manufacturing Co., and others, has created a strong demand for bedding. This is another reason why the furniture makers look toward fall with a fair degree of optimism. It is felt that the general publicity campaign which the Home Furnishings Bureau is planning to launch in the near future will not be without its effect.

Advertising Campaign Taking Shape

American Furniture Men Getting Down to Business — Put New Life Into the Industry — Z. G. Simmons Delivers Some Plain Truths

The third meeting of the executive committee of the Furniture Publicity Bureau was held at the Blackstone Hotel, Chicago, on June 10. After considering reports of investigations made since the previous meeting, the committee determined upon the basis of yearly assessment on which the manufacturers of furniture will be asked to pledge for three years. The retailers of furniture will also be canvassed to pledge for three years an amount in line with their output.

These pledges will be issued immediately to manufacturers and retailers and a business agent engaged to conduct the work of securing signatures to those pledges as rapidly as possible. During the July market meetings will be held both in Grand Rapids and Chicago to feature the work of publicity and the necessity for securing funds to carry out the work on a basis which will be acceptable to the furniture industry. As soon as the manufacturers and retailers of furniture have demonstrated their willingness to support a movement which will in the broadest and highest sense possible create an appreciation of the American home, the machinery will be put in operation for educating the manufacturer salesman, the retailer salesman and the public as to the essentialness of furniture.

At the organization meeting, which was held earlier in the year, Z. G. Simmons of Simmons, Limited, was called upon for an informal talk. Mr. Simmons struck out straight from the shoulder. The points brought out and emphasized and the breadth of vision and aggressiveness shown make his address well worth reproducing. His message was as follows:

Need More Backbone.

"I don't know what to say about this thing unless I speak what I think. My own impression is (and I count myself in, so I don't want anybody to take offense at anything I say), that we are about the cheapest cheap-skates in any large industry in America today; that we absolutely lack vision and "guts"; that we have got the most important thing to deal with of anything that concerns the human family, except its food and possibly its clothing; that we have made a miserable record in producing rotten stuff over a period of years—and that can be almost generally applied. Now, remember, I count myself in that. The stuff we have made up in comparatively recent years I am ashamed of; and I'm ashamed of every single piece and I wouldn't have one of those pieces in my house. I have seen stuff from the Karpen Company that I'd run into Canada to get away from, and yet we expect the American public to patronize us, give us its money and have a continuing, growing business.

"If we had one-tenth of the "guts" that these automobile pirates have there would be few long faces in this "bunch." It struck me, in thinking this thing over after I came out of the blue sky in October last year and got part way back to earth and found what a debauch I had been off on, that as a class we are a lot of peaches—pikers. I don't know what this scheme is here. I haven't been in on it, but if you are going to sell American people back to the old idea that home is the cradle and the foundation of our modern civilization, you have got the finest thing in the world to sell them and we wouldn't have half enough furniture factories in the United States of America to make the products they want if we could restore the home to where it used to be. (Applause.) Things are pretty bad when they will mortgage their home to buy an automobile, when they will take their life insurance policies and forfeit them to buy an automobile. I happen to be a trustee of a life insurance company up in Milwaukee, and they have got about $450,000,000 assets, and I think they have about $75,000,000 loaned on policies—absolutely defeating the very object of a life insurance policy—and more than 75 per cent. of the $75,000,000 was to buy automobiles.

"Just think of those automobile fellows having "guts" enough to hire Madison Square Garden year in and year out, and coming down here and taking this barn they call the Coliseum and putting on a show and charging you to go in and see the stuff they are going to sell you and making you pay cash for the darn stuff! I will make the prediction now that they will be the means of leading us back into a fairly good business this fall. Who would imagine that the day had come when that business which has prostituted every principle of common, decent business, would be the means of taking the rest of the business of this country onto a fair plane of activity.

Proper Spirit Will Do It.

"When the armistice was signed we had cramps and began to get sour in the face and worried and thought the game was up. The automobile dealers said, 'Hell! By spring we won't be able to fill your orders,' and by spring they were not able to fill the orders, and they are now telling us that if we don't hurry up and buy a car we won't get it, and yet we all know there are so many manufacturers and such great production that it seems utterly impossible for only this nation, but the whole world to take their products off their hands. But they don't think so, and they go out and persuade the American public so it don't think so, and they do business all the time.

"The great furniture industry, the greatest industry in America, should contribute to the making of attractive homes, and we, as Americans, especially those of us that are here, want our fellow-men to live on a better plane; if we don't, the lake is out here to jump in and we might as well get in now as later. We want their children educated, we want this great commonwealth to go into a higher, better sphere, into higher, better things—all of us do. And the cradle, the place where the world begins, the foundation of that kind of citizenship is made and laid in the home—the answer to all the 'isms' that have been worked up in the last ten or fifteen years, and God knows there have been enough of them. That concerns us; that is our line of business and we ought to play it up, not down. We are going to refuse to make certain merchandise we can sell at a profit because we know the darn stuff is no good. We are going to try to make our products better and better and better. We have got to be dissatisfied with everything—with every single solitary thing we produce and produce it better. Nobody ever went

wrong trying to make a thing better. He has gone wrong when he tried to make a thing worse.

Advertise an Ideal.

"I don't believe you will get anywhere with an advertising campaign that concers the sale, specifically, of anybody's product. I think if we could be big enough (I don't know that we can be) to go out on a program that sets an ideal, and create the demand on the part of the husband and wife and children to have a better home, then everything else would follow. If you could sell the husband and wife—the husband who works in the shop—with the idea that they must fix up their little home, a great deal of the trouble that has been brewing would be eliminated and the job would be done.

"It is a pretty hard problem to get a hard-headed business man to put up a lot of money to sell an ideal without a direct connection as to whether he is going to sell a bed or something of that kind and get his profit yet I believe that any advertising scheme you sought to put forward that didn't encompass in its fundamental principle the welfare of the public would not get anywhere.

"I don't think we can tackle the hall the dining-room the kitchen, or any other particular room. I think we have got to create in the minds of a great mass of people that they want to fix up their homes.

Spend One Million Selling Sleep.

"I have heard some discussion here about a half million dollars. Well, our firm is a little bit of a spot in this great industry, and we expect to spend twice that amount of money on our own business alone. We have made our advertising, as some of you have noticed, rather general. We have talked about sleep.

"We were advertising a certain number or style of a certain bed—something we made—and I ran into a fellow who said: 'You're a fine specimen, you are! You've been talking about the labor problem and Lord knows what all. Why don't you apply those same things you are talking about now to your own business?' I said: 'We do.' He said: 'You don't.' We were in the Waldorf cafe, and we had had several and were sitting there talking things over. There were as many men as there are in this room drilling into dinner, and he said to me: 'Now, how many people are there in this room?' I made a guess. He said: 'You have got something they have all got to have. Why don't you sell them that?' I said: 'What's that?' He said: 'Sleep.' I said: 'You put your finger on it. What's your business?' He said, 'I'm an advertising man.' I said, 'What's your proposition and what's your price?' He said: 'Well, it's a little peculiar. I take a retainer fee.' I said: 'Well, what's your price.' He said: 'I don't understand. If you mean what will I take you over for and take charge of the advertising for, I'll do it for $25,000 the first year.' I said: 'Here, you write out your plan while I go out and get a telegraph blank and discharge the people we have already got.' I went out and sent the telegram, and when I came back he had his proposition written out, and I signed across it, and we have been trying to convert a lot of people around this country that sleep plays an important part in their lives, and it hasn't hurt us a darned bit, I'll assure you, if somebody else has sold a few articles of sleep, because we have sold so darn many more. The month of March was the largest month in our history. We haven't heard one word about price, with the exception of one customer out of 14,000 customers on our books. Think of it! And there we are in an American-manufactured panic without any excuse for it, but we have got it and somebody is talking deflation and normalcy and liquidation, and God knows what all, and we are not bothered with the word 'price.' We make a competitive article, too. I stand here and tell you that in days gone by we have made as high as 100,000 beds in a year and sold them at a loss of 25 cents to 50 cents a bed because we had an idea we had to have a leader. Now we aren't making a doggone thing that hasn't got a full, fair profit, and we are not going to, either. Furthermore, the people that buy are product want it. We have made more money and they can make more money, and the American public is not interested in price, it is interested in value.

"As one member of this great industry, I would like to see it take a new birth. I would like to see the men in this industry visualize it on a very high plane. I would like to be a party to a great propaganda to sell the American home back to the American people and take our chances with what we put in it, but we have to set high standards of good merchandise, well-designed, well-finished, and then we would be on a permanent basis and we would not have to apologize to any other industry in America."

RAILROADS KEY TO SITUATION.

W. M. Ritter of the W. M. Ritter Lumber Co., Columbus, Ohio, has been in Washington, D.C., recently, working with Government officials and railroad executives in an endeavor to devise a plan that will tend to improve present conditions.

Mr. Ritter believes that the railroads are the key to the industrial situation, that there is nohing which will so quickly improve industrial conditions as the inauguration of a comprehensive buying compaign by the various railroad companies. Such a campaign would be the definite beginning of a prosperous era. He says in part that the railroads are the natural and logical buyers to start business, as they purchase normally about 35 per cent. of the production of a private industry. Before this can be brought about funds must be provided. For this reason an immediate and liberal settlement of the Governments obligations to the railroads should be effected. He further adds that there should be no thought at the present time of reducing freight rates. The question of rate adjustment should not be agitated until the railroads are in sounder shape and then rate structures should be scientifically worked out with a view to conserving industry, increasing tonnage and producing a greater net return.

If the railroads were in a position to enter the market there is no telling how far-reaching the results might be. The psychology of the buying circle is not clearly understood by the average mind. Buying begets buying. What is the finished product for one is the raw material for another, and the producer of the raw material is the ultimate consumers of the refabricated article, and so the process continues in an endless circle of activity—when transactions are taking place and industries functioning normally.

It has been estimated that the use by the railroads of $500,000,000 in paying debts and making purchases in order to meet ordinary requirements, would result in clearing transactions aggregating a total of over $5,000,000,000.

Eight of the ten different styles of houses in the development of the Border Housing Co. at Walkerville, Ont. Monotony of design has been successfully eliminated without sacrificing economical standardization.

A House Every Twelve Hours

Ambitious Building Scheme Completed at Walkerville, Ont. — One Hundred Houses Completed in 150 Days — How Standardization Was Used to Excellent Advantage

During the spring and summer of 1920 the large industrial plants situated in and adjacent to Walkerville, Ontario, experienced considerable difficulty in retaining the married men in their employ on account of the acute shortage in the Border Cities, of suitable houses to rent, or even to buy, on terms within the reach of the average mechanic's means. To overcome this undesirable state of affairs, which materially effected the efficiency of their production, and in order to place within the reach of their employees an opportunity to secure desirable homes which could be purchased by payment of a small amount down, with fixed monthly payments afterwards, which monthly payments would be less than the current rents charged, the principal industry of Walkerville formed the Border Housing Company.

This company undertook the erection of one hundred houses in the town of Walkerville and operating through the Walkerville Housing Commission, under the Housing Act of 1920 secured the maximum amount of money allowable under the act, furnishing the balance of the money required themselves.

Standardization Without Monotony

It was the desire of the company, for the sake of economy, to standardize the houses as far as practicable and still if possible do away with the monotonous and undesirable appearance of group construction so common to projects of this kind where the same architectural features of exterior construction are used throughout. The plans finally decided upon called for a storey and a half house 23 ft. 6 in. by 30 ft. 9 in. with full basement and mass concrete foundation walls to ground elevation, integrally waterproofed. From grade to first floor and in some instances to first floor windows the exterior walls are either of brick or hollow concrete blocks, four different finishes to the concrete blocks being used, viz., rock faced cement, smooth cement, rock faced granite and smooth faced granite. The foundations in all cases have a waterable course at grade. From foundation to roof-plates, all walls are of solid construction, either brick or stucco on hollow terra cotta tile. The gables, where these occur, are studded, sheeted with one inch matched lumber, lathed and stuccoed in all cases. All roofs, excepting dormer roofs, are shingled with B. C. cedar shingles, 14 lb. asbestos paper being used under the shingles. The dormers are covered with three-ply prepared roofing.

The interiors are as shown by the plan, the same layout being common to the one hundred houses, which are plastered throughout and finished in clear B. C. fir. Ten different color schemes were used for interior painting and staining. Single pine floors were used for the ground floor and a rough floor only in the attic. The stair shown in the plan leads to an unfinished attic which has two and in some cases three windows. It is the intention of the company to let the purchaser convert the attic into one or two rooms as he so desires.

Ten Different Types

Ten different types of exterior elevations were used (ten of each type) and to further do away with too much uniformity even in each type seven different kinds of face brick were used, four different kinds of stucco, and fifteen different color schemes for exterior woodwork. By using different face brick, stucco, and color schemes and varying the appearance of the foundations as before mentioned, the ten houses in

each type were each subjected to a different architectural treatment and helped to impart to each house a certain individuality not possible, without making the cost prohibitive, if any other method had been used.

A contract for 100 houses was awarded the Russell-Navin Construction Co. and now the Russell Construction Co., Toronto. The contractors undertook

Showing houses in course of construction

the work upon the basis of actual cost plus a fixed sum for commission and supplying plant. The contract provided for a penalty to be collected by the company from the contractors if the final net cost, according to plans and specifications exceeded the estimate given by the contractors, and for a bonus to be paid by the company to the contractors if the final net cost was less than the estimate. In spite of the forty per cent. increase in freight rates, which materially increased the cost of material, the work was completed well within the estimate.

All material was purchased wholesale from the source of supply and all labor minimized by the use of machinery wherever possible. A small electrically driven saw and planing mill was erected by the contractors upon the property and equipped with three Elliot universal woodworkers, band saws, planers, and sander. All lumber of every description for interior and exterior use was cut to size and prepared for erection at the mill and then sent to the different houses ready for application, very little of anything but nailing being done in the field by the carpenters.

One House Every Twelve Hours

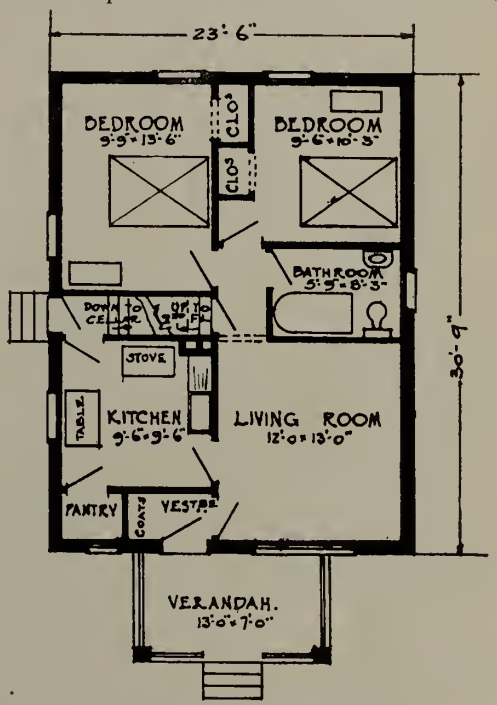
The work was well organized and the whole one hundred houses completed, with the exception of a little painting and grading which could not be done until the frost was out of the ground, in one hundred and fifty working days of eight hours each, or at the rate of one house every twelve working hours. No overtime whatever was put in by the field mechanics and very little by the millmen and unskilled workmen. When it is considered that the work was carried on throughout the winter months and practically all the material used had to be imported after the contract was let, causing delay in some cases, the brick coming from Chatham, Toronto and Montreal, the tile from Toronto and all lumber, lath, shingles, and interior finish from the Pacific Coast, the progress made was highly satisfactory.

These houses are being disposed of at $5,800 each, with small cash payments and very favorable terms. A person securing one of these homes would find that a monthly payment, which would not be as large as the current monthly rent for a house of this class, will carry the interest charges, pay taxes, etc., and reduce the amount standing against the house. It is understood that the net construction cost of the houses themselves, not including land, improvements, administrative and interest charges, is in the neighborhood of $4,050 each.

Contemplates Large Box Factory

H. C. Lake and associates, business men of Lake Charles, La., visited Victoria and Vancouver Island points recently to investigate the advisability of establishing a large box factory for export trade. The visitors investigated, particularly, the possibility of purchasing the required type of logs in an open and uncontrolled market and, should the logs be controlled by a loggers' agreement, the possibility of purchasing and operating their own timber limits. The trade to which these men would cater, would be the American and foreign demand for knocked-down boxes, shipped in car and ship loads. The woods considered best suited for this trade are spruce and hemlock. The visible end of the American supply of pine and other soft woods suited to box manufacture, and the fact that Vancouver Island has vast acres of such commercial timber as yet untouched are the main reasons which brought these gentlemen to Victoria.

Commissioner Thomson, of the Victoria and Island Development Association, who is responsible for the visit of the Americans, states that the securing of such a large factory as is contemplated would be one of the most important deals closed for a long time.



Layout standard floor plan

whether established at Victoria or some other island point. It is understood that the old Indian Reserve, the centre of industry in Victoria, is considered as probably the most suitable location. Mr. Thomson also announces that the Development Association is negotiating for the establishment of a factory to manufacture broom handles. This plant, it is proposed, would also be established on the Reserve.

Need Is For Trained Engineers

Woodworking Industry Has Not Made Progress Compatible With Its Importance — Many Big Problems Awaiting Satisfactory Solution — How Mechanical Engineers Could Relieve Situation

By Sern Madsen, Clinton, Iowa, Address before American Society of Mechanical Engineers

Like most other industries, woodworking is divided into two steps—primary and seeondary. The first deals with the production of raw materials and the second with the manufacturing of finished products from these materials. We may properly define these as lumbering and woodworking. It will not come within the scope of this paper to deal with both of these rather distinct and separate divisions. The engineer is equally essential to both of them, but we shall here consider his connection primarily with woodworking.

The lumbering and sawmill industries probably reflect the work of the engineer much more vividly. A modern sawmill is in every way as impressive and fascinating as any modern steel rolling mill. The engineering skill required in its design and operation should be less than that in any other large industry. The engineer quite naturally devotes his energies to the solution of the larger and more attractive problems. This may in part explain why in certain respects the lumbering industry has received more of his services than the ordinary woodworking plant.

Offers Unlimited Scope for Development.

To say that the woodworking industry is in a very primitive state of development is decidedly wrong, but we can truthfully say that it has not made the advancement becoming to an industry of its size. It has been estimated that in the United States alone the annual output of lumber would be sufficient to build seven separate plank walks each 25 feet wide and all extending from the earth to the moon. It has likewise been estimated that about 1½ million people earn their livelihood in the lumbering and woodworking industries. These illustrations help us to grasp the importance of woodworking. How can we explain the fact that so few engineers are engaged in this work?

It is but recently that agriculture, stock raising and some other large industries have begun to use scientific methods and to draw trained men from our colleges and universities. It is almost universally true that the older an industry is, the slower it is to adopt modern methods. The fact that it is old means that it has for centuries been esssential to man's existence. It means that the son has quite generally acquired skill in one or another of these industries from his father. It means that in the past it has been possible to conduct these essential industries with small plants, small capital, and a comparatively small amount of skill. Competition in the past has not been keen enough to require unusual effort, efficient equipment, or scientific knowledge in order to make a decent living or even become fairly successful in these trades.

Requires Intensive Effort.

During the last half century the woodworking industry has gradually developed newer and better methods and more efficient machinery, until it has now reached the point where we might say it requires intensive effort. Where in the past it has developed slowly under the old conditions it now requires the added help of applied science. Modern production methods so successful in other industries are being rapidly introduced in the woodworking industry, and it requires the aid of the engineer to apply them.

One should not get the idea that woodworking has not been influenced by the engineer. On every hand we have evidence of his handiwork, but its effects on the industry have generally come about indirectly For several years our government and some of our colleges have conducted scientific studies on the subject of lumber, its properties, uses, treatment, etc. The theory of drying, for example, is simple enough, but to carry out this simple theory is quite another problem. No two pieces of lumber are exactly alike; hence, in practice, we must deal with averages. It is one thing to make a laboratory test under the direction of a scientifically trained professor and quite a different thing to dry a large lot of heterogeneous lumber under the direction of the average dry kiln operator. In this field we are but partly reaping the benefits of scientific investigation due to difficulty in its fullest application to actual practice.

Compared With Metal-working Equipment.

The modern woodworking shop uses the same tools as developed in the average metal working shop. It is true that they are different—they must be different due to the nature of the materials, but the principles are the same. The greatest difference is in cutting speeds and feeds. Let us compare a few of the tools and processes

1. Sawing—Tools for this purpose are very similar, except for differences in size of teeth, temper, etc. The speed for metal is less than 100 feet per minute, while for wood we use as high as 8,000 feet per minute.
2. Planing and Surfacing—Tools used for metal have a more or less scraping cut. Parallels in woodworking tools are the carpenter's hand plane or a scraping tool or even a scraping machine.
3. Drilling—in drilling metals the peripheral speed of the drill is seldom over 40 feet per minute. In wood the bits may have a rim speed in excess of 500 feet per minute.
4. Milling—In metal cutting the milling head has a surface speed of less than 50 feet per minute. In woodworking the speeds may run as high as 10,000 feet per minute. By far the largest percentage of woodworking machinery performs its work by a milling operation.
5. Abrading—This process may be called grinding when applied to metals, but it usually consists of sandpapering when used on wood. The peripheral speeds of grinders and sanders at the cutting surface are approximately the same. There is, however, a great difference in the feed.
6. Turning—This process is very similar in both fields, except as to speeds.

In the development of machines in the above class. the mechanical engineer has devoted more of his time to those for working metals. His neighbors in the woodworking shop have patterned after his creations

with creditable results. It is often true that wood working machines may in some cases be crude but that is no reflection upon their designers. Metal working machines are usually designed by engineers who know and understand the work the machines must do. They have the knowledge and the facilities for producing the best to be had. On the other hand woodworking machinery has generally been conceived and designed by ingenious men in the shop. Lacking a thorough knowledge of machine design and facilities for building a machine the job is generally turned over to a machine shop. The usual result is a machine that works, but the chances for the success of that machine are decidedly less than for the more favored machine shop tool. These illustrations show how important it is that the woodworking industry should have in its employ mechanical engineers who may become thoroughly familiar with all the needs and requirements of each particular process or machine, and with the aid of their scientific training design and produce efficient equipment.

New Methods and New Machines.

In both the metal and woodworking industries we find so-called standardized machines. Standardization in woodworking machinery has not yet progressed very far. While some machines are standard, others are stereotyped. Designing has been largely handled by cut and try methods rather than by engineering knowledge. Certain details of construction developed 50 years ago are still blindly followed, though better construction is evident. Changes often are retarded by the mental inertia of older machine operators and older designers. An injection of new thought is needed to remedy this state of mind.

The trend of the times has brought about a need for more efficient woodworking machinery and at the same time there have been important developments in the engineering field that make great improvements possible. There are at least three factors that are at present tending to revolutionize woodworking machines. These are high speed steel, ball bearings, and the electric motor. Just as the development of high speed steel meant a re-designing of heavier and more efficient lathes and planers for metals, just so is it affecting woodworking equipment. It has increased planer feeds from 75 or 100 feet per minute up to as high as 300 feet per minute. At the same time delays due to necessary resharpening have been reduced. This increased speed has required larger and better bearings, heavier frames, and faster and better feed works. Sad to relate in this re-designing, the best of engineering practice has not always been used.

The average cutter head runs at from 3,000 to 4,000 R.P.M. and the bearing requirements are extremely severe. Lubrication presents another problem. Power loss is large in high speed poorly lubricated bearings Accuracy of adjustment is also difficult. Probably more different styles and types of bearings have been tried out on woodworking machines than in any one other industry. In nearly every case they have been found wanting. The old style plain babbited bearing has dominated the field, probably because it can more easily be renewed, rather than because of its virtues. Just now it seems that machinery manufacturers are trying to outdo each other in the adoption of ball-bearings. In many places these have proven themselves to be very satisfactory.

Until about 15 or 20 years ago practically every woodworking plant was belt-driven from a factory engine. When the polyphase induction motor was developed it began to replace the line shafts. The first practice was to use a motor for driving a group of machines on a short line shaft. This practice gradually gave way to individual motor drive, the motor usually being belted or directly connected to the main countershaft of the machine. The power savings due to elimination of belting and shafting and the convenience of individual motors greatly favored this type of installation.

In an effort to eliminate more belts and bearings the tendency in the last few years has been to connect the motors directly to the cutter head arbors. This construction often involves the use of as many as eight or nine motors on a single machine. At first couplings were used between the ends of the motor shaft and the cutter head arbor. Some problems of maintaining proper alignment were met and the present tendency seems to be to eliminate the coupling altogether and place the rotor of the motor directly on the cutter head arbor itself or conversely mount the heads directly upon the motor shaft. Here we again meet with bearing difficulties, and the ball-bearing is now used extensively. It will require a few years' experience to determine the wisdom of fallacy of this latest design.

We can thus see that woodworking machinery design is now being influenced more by current engineering practice than at any other time in its history. Already we have higher speeds, better bearings, and better methods of power application, necessitating more than ever the expert attention of the mechanical engineer in the modern woodworking plant. The present trend of design is to produce more efficient and better machinery. Along with this must come better operators and better mechanics. When any industry adopts the latest engineering practice, it must also adopt the engineer.

To be concluded in August issue

TO HANDLE LEATHERS AND BELTS.

The Mechanical Leathers, Limited, 126 Garden Ave., Toronto, has been appointed Canadian representatives for the Chicago Rawhide Mfg. Co. of Chicago, Ill. This company has been but recently organized. R. W. Coleman, the president, is a Virginian by birth, but has lived in Canada for many years. He has had considerable experience in this field, having been belt and sales engineer for the Chicago Rawhide Mfg. Co. for a long period. H. R. Alley, the secretary-treasurer, is a Toronto man, a graduate of the University of Toronto and of Osgoode Hall. He was overseas with the 3rd Battalion and the First Contingent and served with that unit until severely wounded in the Somme fighting. Upon his return to Canada he entered the sales department of the Goodyear Tire & Rubber Co., where he remained until joining the organization of the Mechanical Leathers, Limited.

The new company is carrying a stock of belts, belt lacing, rawhide gears and high-grade upholstery grains in their Toronto warehouse. A line of imitation leathers is also being handled.

It may be of interest to note that the products of the Chicago Rawhide Mfg. Co. are produced on a quality basis. Their leathers are cured by a slow process and no acids, barks or chemicals being used in their cure. It is claimed that this method greatly increases the strength and flexibility of the leather, tending to reduce slippage in belts and to prolong their life.

A Study in Millwork Costs

Results Must be Accurate to be Valuable — Data Gathered From Books of Different Canadian Plants — How Do These Figures Compare with Yours?

Millwork costs was one of the main topics for discussion at the meeting of the Southwestern Ontario Retail Lumber Dealers' Association held recently at Chatham, Ontario. A committee, consisting of M. R. Bogart, Chatham, L. H. Richards, Sarnia, John T. Wallace, London, and B. F. Clarke, Glencoe, had been appointed to consider millwork costs and the report they brought in is as follows:

In the first place we have only considered such items as generally affect all members of the Association, such as inside and outside door and window frames, feeling that with these essential items on a proper basis, the better grades of mill work such as stairs, panelling, etc., will naturally adjust themselves.

Each member of the committee gave the subject considerable attention and worked out the costs in each factory individually and on meeting together were surprised at the similarity of their results and, therefore, feel that the figures shown represent the actual facts. Facts, with which we as mill men are suffieiently familiar.

All estimates on outside frames are based on using white pine throughout and all frames are figured assembled or built up. The costs arrived at and agreed upon are as appended, and we are indebted to Mr. Richards for printing them.

The question of trim has not been considered as it is simply a matter of computing casings, etc., per lineal foot from any of the published wholesale lists, and which costs, plus freight, should represent our own productive costs on these items. Your Committee also found in this connection that nearly every mill had a different system of supplying such trim so that no set cost could be shown.

Please bear in mind that the prices shown are costs and do not include any profit whatever. This must be added and can only be determined by each individual member.

Your Committee were a unit in expressing the opinion that, under present conditions and prices, our factories are being run either at a loss or on altogether too small a margin of profiit, considering the investment involved, being merely an adjunct to our yards, and recommend that some effort be made to place the factory upon a more profitable footing so that it can stand independent of the yard as regards profits.

Under existing conditions the yard man who has no mill, and is buying his mill work from a nearby factory has a more remunerative investment than the man who has the drag of a factory upon his hands, a condition which, in our opinion, should be remedied.

Factory Costs Report.

The figures snbmitted by the Mill Work Cost Committee were as follows:-

Window Frames—

For either frame or brick veneer wall up to glass width of 30 in., 19 ft. B.M. white pine in jambs, heads, etc., at 10c	$1.90

Mouldings—

16 ft. blind stop, wt. pine, 1½	.24
16 ft. parting stop, wt. pine, 1½	.24
16 ft. O.G. 1¾ stop, wt. pine, 1½	.24
16 ft. brick mldg., wt. pine, 3	.48
	$3.10
15 per cent. lumber waste	.46
4 pulleys	.40
Machine work and assembling	1.25
Nails and screws	.12
Cambers and braces	.50
50 per cent. overhead cost on labor	.63
Total cost	$6.46

The price of $100.00 per M. on wt. pine lumber in jambs, etc., has to take care of difference in sizes of jambs, etc.

Window frame for solid brick wall, add	.50
For same window frame for glass width over 30 in. and without transom bar, add	2.25
Double or mullion frames	Double above prices
Triple frames	Three times above prices

Casement Window Frames—

Cost based same as above, say for glass size 24 in. x 30 in. 1 lt.	$5.90

Sash and Doors—

Cost on these not gone into, owing to the complete information in Sash and Door Association Catalogues, showing actual cost to us.

Outside Door Frame—

24 ft. B.M. wt. pine in jambs, at 10c	2.40
18 ft. brick mldg., at 3c	.54
Cambers and braces	.50
Nails, etc.	.10
15 per cent. waste on lumber	.44
Labor, machine and nailing up	1.25
50 per cent. overhead on labor	.65
Total cost	$5.88
If 2 in. oak sill, add	1.00

Inside Door Frame K.D. with Stops Supplied—

18 ft. R 1 x 6 clear Y. pine, 9 ft. at 10c	$ .90
18 ft. R stop 1¾ pine, at 2c	.36
	$1.26
15 per cent. waste on lumber	.30
Labor	.40
50 per cent. overhead on labor cost	.20
	$2.16
For arch jamb, add	.50
For 2 in. rabbetted jambs, same basis	2.40
For 2 in. arch jambs, add	.75

Cellar Window Frames—

12 ft. B.M. 2 x 8, 16 ft. B.M. wt. pine, at 10c	$1.60
4 ft. B.M. oak strip	.15
15 per cent. waste on lumber	.26
Nails	.10
Actual labor paid	.75

50 per cent. overhead on labor cost ..... .38

$3.24

For coal chute frame with oak sill, add 1.00

In an effort to ascertain whether or not these figures were approximately correct and in line with the cost figures and methods in vogue in other districts, the "Canadian Woodworker" submitted this report to a number of prominent woodworkers and others vitally interested in this field, asking for comment and suggestions. Several interesting replies were received, two of the most interesting from H. T. Didesch, of the Millwork Cost Information Bureau, and from C. B. Harman, of the Southern Sash, Door and Millwork Manufacturers' Association, are reproduced herewith.

Mistake in Application of Overhead

For Correct Results Burden Should be Sub-divided and Applied Differently — Outline of System Followed in Many Plants

By H. T. Didesch, Millwork Cost Bureau, Chicago, Ill.

The compilation of frame costs recently prepared by the millwork cost committee of the Southwestern Ontario Retail Lumber Dealers' Association, if subjected to critisism, must be said to contain a decided misapplication of the factor of the cost called "burden" or "overhead". Too frequently this same fault is in evidence. Many cost tabulations, when analyzed, will be found painstakingly accurate in respect to the material and labor elements, but through the haphazard adoption of an illogical and inequitable burden plan, the otherwise accurate records become thoroughly distorted, with the result that the final costs thus determined

H. T. Didesch, Chicago, Ill.

are inaccurate and actually too dangerous for use

In the case under review, the millwork cost committee resorted to the burden plan known as the "percentage of labor plan". This plan provides that the gross amount of burden accruing during a certain period—preferably a twelve-month period—be divided by the total amount expended for direct labor during the same interim. The resulting percentage is then applied to all direct labor charges that occur during the succeeding months. Without question, the per cent. of burden thus arrived at is arithmetically correct, but the application of that percentage to individual jobs or orders produces some glaringly inconsistent results. To illustrate this condition it is necessary only to cite the following example:

Two sawyers are engaged in cutting up plain red oak for finish. Brown, a very efficient sawyer, receives a wage of 70 cents per hour, while the other man, Smith, is less expert, and is paid but 60 cents per hour. The cost calculation for both men, considering a work period of eight direct hours, would be:

Example "A" (Brown).

Labor, 8 hours at 70c	$ 5 60
Burden, 145 per cent.	8.12
Total cost	$13 72

Example "B" (Smith).

Labor, 8 hours at 60c	$ 4 80
Burden, 145 per cent.	6.98
Total cost	$11 78

Whether or not Brown's cut resulted in a greater net footage than Smith's, it is evident that the burden charged against Brown is exvessive or otherwise that charged against Smith is too low. Both men work continuously for eight hours and in each case the actual burden consumed should be identical, or at least substantially so. The heavy factors of burden, viz., floor space, heat, light, water, etc., are the same for each operative, and while Brown may have used a trifle more of power and oil, and perhaps the wear and tear on his saw was just a little greater, these differences would be hardly perceptible and, under no circumstances, would equal 17 per cent. more than Smith's burden.

Then consider also the case of two benchmen—Jones and Young. Jones, a skilled artisan, who performs such work as carving out stair rail crooks, assembling radius stringers, etc., is paid 80 cents per hour. Young is an apprentice, who nails up cap trim, common porch posts, etc. His rate is 50 cents per hour. Figuring their respective costs for a period of eight direct hours would show results as follows:

Example "C" (Jones).

Labor, 8 hours at 80c	$ 6.40
Burden, 145 per cent.	9.28
Total cost	$15.68

Example "D" (Young)

Labor, 8 hours at 50c	$ 4.00
Burden, 145 per cent.	5.80
Total cost	$ 9 80

Here again is a pronounced miscarriage of the theory that factory burden or overhead increases or decreases in direct proportion to the cost of the labor required to produce a given article. In fact, it would appear on the surface that efficiency tends to high

overhead, whereas actually the reverse is true. Within certain limits, burden consumption does depend on labor expended, but not on the value of the labor expended. The whole trouble lies in the fact that the dollar is not the basic unit of measure for factory burden application. The proper unit of measure for burden in the factory operations of a millwork establishment is the "man hour." Assuming, for instance, that it has been determined that the burden rate per man hour in the factory is equivalent to a flat rate of 97 cents per hour, the former examples "C" and "D," recalculated on this basis, would produce results, to wit:

Example "E"—High Wage.

Labor, 8 hours at 80c	$ 6.40
Burden, 8 hours at 97c	7.76
Total cost	$14 16

Example "F"—Low Wage

Labor, 8 hours at 50c	$ 4.00
Burden, 8 hours at 97c	7.76
Total cost	$11.76

You will observe that the "man-hour" plan of burden application, which involves charging for the use of the factory's equipment and its maintenance, on a basis of the time during which these facilities were in use, is basically sound. It precludes the possibility—as in the "per M of material" plan—of placing an exorbitant burden against those types of work of which the bulk of final cost is material, or an inadequate burden charge on those classes of product that consist largely of labor. Neither will this method—as does the "percentage of labor" plan—saddle on the high-priced, efficient workmen an excessive amount of burden and permit less skilled workmen and novices to absorb only a small burden, when by reason of the additional supervision that they require and the spoilages that they are responsible for, they should absorb the same factory burden rate as the efficient workmen.

The straight "man-hour" plan is excellent as concerns operations within the factory itself, but if the entire burden of a millwork institution is applied at a flat rate per hour, a serious difficulty arises in respect to the traffic in goods not produced within the plant. This particular point, as well as a number of others not considered in the cost plan of the S.O.R.L.D.A. Committee will be further emphasized in the following description of the burden plan that was evolved by the Millwork Cost Bureau and has been in use by its membership for the past six years.

Dividing Overhead Into Units.

The first point recognized is that every mill operator engages to a certain extent in what may be termed a jobbing business; that is, he sells some commodities that for one reason or another are not produced in his own plant, viz.: glass, stock doors and sash, roofing, sash cord, pulleys, weights, screen wire and frequently all veneered doors, except, perhaps, those that cannot be obtained from other sources within a reasonable time. Hence it is absolutely necessary that he know his cost exclusive of selling expense, so that he may determine whether it is to his advantage to buy an item on the outside or to produce it in his own plant. With this thought in mind, the M.C.B. plan draws a line of demarcation between the actual manufacturing and the disposing or selling units of a mill. In other words, the "factory cost" or the cost of all items in their manufactured state is determined first and the charge for warehousing, packing, delivery, selling and administrative expenses, which is termed "commercial burden," is then added as a percentage burden of the "factory cost," the addition of the two costs producing total cost.

The M.C.B. plan takes cognizance also of the fact that bear no relation—from a cost aspect—to the operations of the factory itself, for which reason lumber yard and kiln costs are diffused only over the material handled through these units. These expenses are called "yard burden" and "kiln burden," respectively.

Those expenses relating solely to factory production are segregated as to machine and bench operatives, so that the direct machines and bench men may be burdened at a rate of reflecting their respective proportion of the factory burden.

A distinction between machine burden and bench burden is clearly necessary when it is borne in mind that the machine men consume a much heavier portion of investment in the form of the machine equipment itself, repairs, power and supplies, than do the bench men. Both classes, of course, are subject to one broad, general burden for floor space, heat, light, supervision, etc., and this element is distributed equally to each class of workmen.

Summarizing the Unit Burdens as they exist in the M.C.B. plan, there are then five basic rates, to wit:

1. Lumber—Yardage and Handling Burden, which is expressed as a flat rate per 1,000 gross board feet. The average rate of all Bureau members who operate the "Standard Cost Finding System" is at present $5.20 per 1,000 feet.

2. Lumber—Kiln Burden, which is expressed as a flat rate per 1,000 gross board feet. The average rate is $6.00 per 1,000 feet.

3. Machine Burden, which is expressed as a flat rate per man-hour. The average rate is 54 cents per hour.

4. Bench Burden, which is expressed as a flat rate per man-hour. The average rate is 31 cents per hour.

5. Commercial Burden, which is expressed as a percentage of the factory or manufactured cost. The average rate is 20 per cent. of factory cost.

Each of the burden rates, enumerated above includes its proper share of interest on investment for land, buildings, equipment and average stock; taxes on the same assets; depreciation on buildings and equipment, and insurance on buildings, equipment and average stock and, of course, also the supplies, repair and labor expenses peculiar to each unit. In this connection it might be well to point out that the nails and screws, which, in the tabulations of the S.O.R.L.D.A. Committee, are shown as direct charges, would, under the M.C.B. plan, be considered indirect charges; that is, they are included in bench burden.

Might Result in Manufacturing Losses

C. B. Harmon, Southern Sash, Door & Millwork Manufacturers' Association Outlines Views

I greatly appreciate the printed article which you have sent me, being a committee report of the W O R.L. Dealers' Association held at Chatham last March, all of which I have read with a great deal of interest For a good many years the millwork factories in our section figured their costs something similar to what you have indicated in Canada, but which we have long since found to be inaccurate and unsafe.

I do not happen to be a technical cost expert, but from information which we have gathered throughout this section during a period of five years, do not hesitate to say that we would consider the method as worked out by our Canadian brethren very unsafe indeed; I refer more especially to the percentages of overhead which they use.

We have adopted and are using the system of the Millwork Cost Bureau of Chicago, Ill., and after very wide and careful tests and study they placed the burden of overhead in four divisions, viz., lumber burden, machine labor burden, bench labor burden and commercial burden, which I will indicate to you from a recent cost exhibit just received at my office, as follows

French Doors.

One pair French doors, opg. 5 ft. 0 in. x 6 ft. 8 in., 1⅜ in. thick, each door divided 15 rectangular lights, 3 lights wide, open for glass, with stops, stiles and top rails 4¾ in. over all, bottom rail 9⅝ in. over all, bars 1⅜ in. over all, white pine.

Cost.

Material—Basis 1½ in. C. & B. tr. White Pine—			
Delivered purchase price	$95.00		
Lumber burden	5.20		
Without waste	$100.20		
Waste 20%	20.04		
35 net bd ft. 1½ in. white pine @	$120.24	$4.21	
120 lineal ft. ½ x ⅝ glass top @	1.22	1.46	$5.67
Machine—			
Labor 6.00 hours @	.61	3 66	
Burden 6.00 hours @	.54	3.24	6.90
Bench—			
Labor 3.00 hours @	.69	2.07	
Burden 3.00 hours @	.31	.93	3.00
Factory cost			$15.57
Commercial burden 20%			3.11
Total cost			$18.68

You will note from the above that the total amount of overhead, or burden, figures $7.28, the total amount of labor used in the operation being $5 73; using the method of your Canadian factories as reported to me. their burden or overhead on the pair of French doors would only amount to $2.86½.

The lumber burden of $5.20 covers the handling and carrying charges of the lumber.

The machine and bench burdens used covers nails, screws, glue, and all other supplies, with the exception of lumber—power, insurance, depreciation, repairs, upkeep, superintendent, foreman, detail, etc.

The commercial burden covers all office expenses, bad accounts, trucking, selling and collecting, etc.

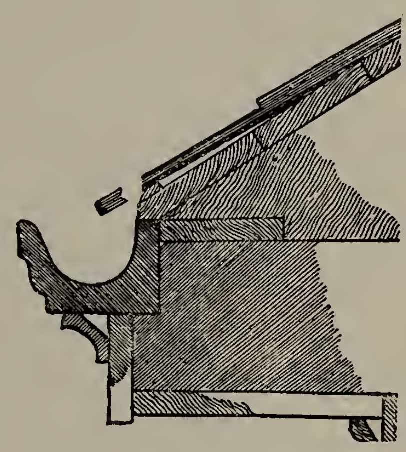
Please note that the foregoing cost exhibit treats each factor of cost in a logical and equitable manner, and if it is not amiss to make recommendations, it would appear that Canadian manufacturers of millwork would do well to avail themselves of similar methods.

The health of the nation depends largely upon its inhabitants being housed in well-built and designed houses.

Some of the small woodworking machines save almost as much labor as the larger ones.

Wood Gutters Are Best

Wood, because of its natural qualities, is basically a stronger construction material than metal. The application of the word "decay" to the disintegration of wood is really a misnomer, for wood never decays: disintegration is caused by fungi which eat the wood. Fungi can be poisoned and hence to-day by the use of wood preservatives wood can be rendered immune to destruction. Such is not the case with metals, however. Disintegration in metals is not caused by fungi, but by chemical action. Chemical action is a natural



Details for application of wood gutter

result of the oxidation of the metal and is usually hastened by acids held in mechanical solution in the air, particularly in cities where there is a great deal of coal smoke. Thus it is that metal gutters rust or disintegrate quickly, but wood gutters last on and on.

It is a strange fact that many woodworkers are not aware of the virtues of wood gutters. As illustrating this point it may be well worth while to cite the example of the Chicago Housing Association. The Bright-Diamond Construction Co., which erected the houses for the Chicago Housing Association, has for many years advocated and insisted upon the use of wood gutters and wood down spouts. When it came time to get the wood gutters for the houses which it was building in Chicago, no wood gutters could be found in the city, but after considerable search some suitable clear fir timbers were found which were taken to a planing mill and run to gutters. Incidentally one of the features of the houses most frequently commented upon by visiting architects and town planners was the use of wood gutters and wood down spouts and a frequent comment was to the effect that the use of wood in these two places solved a very perplexing problem.

Railroads seem to favor wood gutters, many of the better known lines using it exclusively in the construction of stations, freight sheds, warehouses, shops, etc.

The design of the gutter itself and the manner of applying it to building adds greatly to the attractiveness of the structure, for the fir gutter in reality becomes a part of the cornice itself and completes the finish of it.

Boxmakers who are without box printing machines are losing a good deal of good paying work.

Problems in Standardization of Dimension

Subject Discussed from Viewpoint of Wood Users—Dimension Material Offers Certain Savings and Other Advantages—Tendency Toward This Practice

By Wm. A. Babbitt, Chairnan, Committee on Standardization

In our second discussion of the problems of the standardization program, published in the June "Canadian Woodworker and Furniture Manufacturer," the writer pointed out at some length and in detail, the necessity that lumbermen should understand and give due consideration to the wood user's point of view. There is plainly an equal necessity that the wood user should understand and appreciate the lumberman's point of view.

It would seem fair to make a general statement that there is no consideration which will warrant any lumberman in undertaking to manufacture standardized dimension stock, or anything at all, except a sound and reasonable probability that this line of production will pay a fair profit. No matter how strongly the lumberman may be moved by a patriotic desire to co-operate in reducing and finally eliminating the great wastes now obtaining, neither patriotism nor any other consideration of the kind should obscure the basic fact that no unsound, uneconomical business can possibly be patriotic—not even a government railroad administration. No student of the present industrial situation would seriously question the assertion that the demoralization of the lumber industry constitutes the principal cause of the appalling demoralization in the wood using industries. Our foundation has been removed.

Must Change Ideas.

Many of the wood user's most difficult problems are of a psychological kind. It is the "squint" that we have acquired from a long but not altogether venerable tradition. Recently a high executive in a big woodworking industry remarked to the writer: "We have got a funny row on in our plant between the engineering and the purchasing departments. The designer specifies ash for a certain unit, for which laboratory tests show that other hardwoods are equally serviceable. We have on hand sufficient white oak dimension salvaged from other operations to fill this requirement, but no ash. The purchasing manager says he has got to be shown that ash won't do; and the designer says he won't have anything else. So there you are."

Evidently our first problem is to see that our specifications are reasonable from the dimension manufacturer's point of view. We must help our designers to get rid of the idea that they have a free hand to design without reference to the restrictions of raw materials. I speak as one who has bought costly experience. Such an attitude will not only give to our supply sources confidence to produce, but it will greatly conserve and foster the processes of economical production in our own plants. The designer who insists on refusing to use a half million feet of white oak in stock, and on enforcing the purchase of a half million feet of white ash, which for the purpose intended had no advantage, needs "the hook."

The standardization committee is endeavoring to follow out this suggestion in all its procedure. We do not publish any standardization until the rules committees of the Lumber Associations interested have ample opportunity to scrutinize and criticize the conclusions of this committee. Our next problem is to erase completely from our business thinking the old and prejudicial tradition that dimension is made from waste, which costs nothing and that consequently dimension ought to be sold around that figure. It is proper for the lumberman to reply that this idea is correct, providing you can find any waste around your own shop "which costs nothing." The main purpose of this article is to set out plainly the real values which are found in standardized dimension as compared with the lumber necessary to produce our dimension in our own plants. We must be prepared to pay, for dimension, a fair price.

Closely related to the foregoing is the new problem of readjusting our ideas to the new methods of handling, seasoning and routing our stocks of lumber, in the form of dimension. The technical problems are already the subject of intensive study, with the collaboration of the Forest Products Laboratory. Yardage requirements will be greatly decreased, as will be requirements for kiln capacity. The writer believes that it will soon be established that the kiln work should be done by the "dimension producer." At all events the kilning of dimension stock requires a procedure of its own. Possibly this can be accomplished more economically in the plank at the sawmill than by any other method.

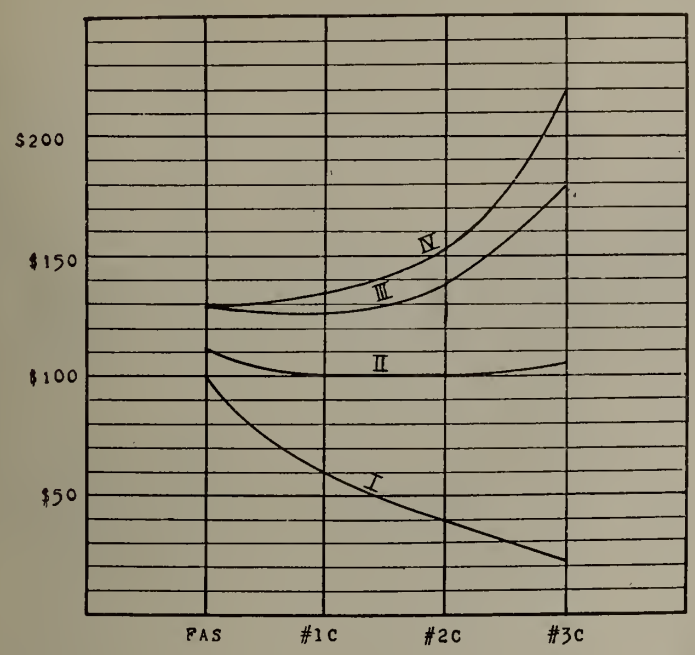
Standardization will also mean the elimination of most of the preparatory processes, taking the wood using industries as a whole. The big "saw-room" will fade to a mere shadow of its former greatness and nuisance. The saw room force will be busy assembling wood products. Business in kindling will greatly dwindle. Cost accounting will probably begin to take on a semblance of veracity—utopian and unbelievable as the statement may read. However, the road to all these desirable results is a long one, and not without very great difficulties.

Theoretical Values of Hardwood Dimension.

The expression "theoretical values" is used because so far it has been possible only to check actual values in a limited way. These theoretical values are actual values, as far as this work of checking has been carried, but might show considerable variation when compared with other lines of experience. For the same reason it is necessary to confine this discussion to hardwoods, although the work of standardization must eventually also cover all coniferous woods.

In the study that follows, we have considered all the lumber portion of the products of the log which grade No. 3 C&B. According to the U. S. Forest Service's Bureau of Industrial Investigations, this is only 40.3 per cent. of the content of the log. So it is evident that when standardization for hardwoods is complete only 40 per cent. of the log will have been "conserved." Among the waste items outside this study are

CHART I



This graph is designed to indicate four comparative values of full mill run hardwood lumber from the viewpoint of a buyer whose location from the originating mill involves a 35 ct. freight rate.

1. Cost of mill run lumber at shipping point.

2. Cost of mill run lumber to make clear stock per thousand feet B. M.

3. Delivered cost, at 35 cents per hundred, of lumber necessary to make 1000 ft. B. M. of clear stock.

4. Total cost to wood user per M. ft. B. M. of clear turning squares, with allowance for manufacturing and disposing of waste.

the following percentages of waste in handling the average hardwood log: Kerf, 13 per cent.; slabs, 12 per cent.; edging and trimming wastes, 12 per cent.; bark, 13 per cent.; and other, about 10 per cent.

Very complete and exhaustive studies have been made by the National Association of Wood Turners as to the clear content of mill run lumber for turning squares. Roughly speaking, northern hardwoods run 50 per cent. of clear stock; while some southern hardwoods run as hgh as 60 per cent. clear stock suitable for turning squares. The following analysis of northern hardwoods (beech, birch and maple) has been checked with the recent cost studies given out by the Michigan Hardwood Association, and incorporates their realization prices, as of May 1st, 1921. Bear in mind that all wood fabrication requiring clear hard wood stock can now draw only 20 per cent. of the content of the average hardwood log. Even the selects fail to affect this slight margin to a practical extent. For easy reference, we have set this up in the form of a chart.

It is interesting to note that the footage value-at-mill of clear cuttings for wood turning stock equalizes in all four grades, very nearly. But as soon as freights and costs at the wood user's plant are added, FAS is by long odds the cheapest lumber to buy, as it is generally known. This is in spite of the fact that the spread between No. 1C and FAS is abnormally large, at the present time.

Great Savings in Lumber and Freight.

Now, if the establishment of a market for standardized dimension stock becomes effective, by means of which the bulk of low grade lumber (and all mill waste possible) can be marketed as net dimension, the enormous wastes and expense involved in shipping low grade lumber will be eliminated.

Freight will have to be paid only on the net usable salvage of low grades and waste. Now ostensibly the cost of freight is included in the price of the lumber and loaded on the buyer. Actually, it is an open question which party is paying the freight. About now the lumberman is not only paying all freight, but he is paying considerable in addition for the privilege of shipping on that basis. Last year, at this time, it was the other way 'round. However, the freight paid on the non-usable portion of graded hardwood lumber is a dead loss, whoever has to pay it. The conversion of low grades into net dimension will entirely relieve both parties from all liability to pay this dead loss, which in the aggregate is a staggering sum. Possibly a thorough study of the freight problem would lead to a

The white areas represent the relative amounts of freight wastes involved in shipping the four standard grades of hardwood lumber. Black areas show the freight paid on stock usable for such purposes as furniture, wagons, and wood turning and shaping.

CHART II

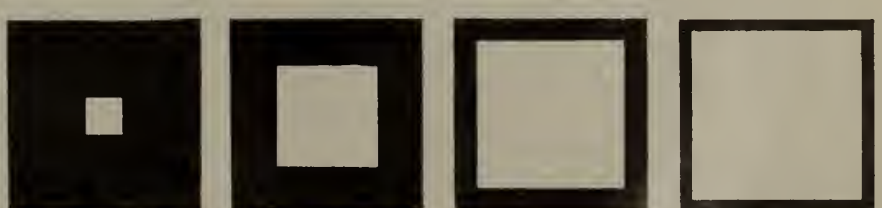


Fig.1 FAS Fig.2 1C Fig.3 2C Fig.4 3C

different conclusion, but apparently the money values involved in this single item of freight waste is a sufficient warrant for both lumbermen and wood users to league together to make effective the whole program of standardization.

In order to bring this out as graphically as possible, we have prepared the following chart. The black portion of each square represents the relative amount of freight paid on the usable portion of each commercial grade of hardwood lumber. The white portion of each square represents the relative amount of freight waste involved in shipping commercial lumber. The total amount of this waste is only six points less than the freight on the usable portion. This means that the freight charges on all raw materials for hardwood fabricating industries such as furniture, are almost exactly double what they need to be. The fluctuation between the "buyers'" and the "sellers'" market decides which party has to pay this double freight charge.

In these three papers an attempt has been made to discuss the general problems of the standardization program. No attempt has been made to handle any of the patriotic or altruistic phases—not that the value of these considerations are held to be of minor importance. No attempt has been made to furnish a technical basis on which to undertake the manufacture and marketing of dimension stock. These factors will be dealt with as occasion may arise.

Summarization of Advntages.

To summarize the considerations which have been discussed more or less adequately, as sound reasons for both lumbermen and wood users to give their support to the standardization program, we have arranged these considerations in parallel columns, as they affect favorably one or the other of the parties at interest.

Lumbermen	Wood Users.
1. Provides a market for product of surplus low grades and mill waste.	1. Eliminates all cartage and handling wastes.
2. Greater utilization of product of tree means lower cost of stumpage and conservation of standing timber.	2. Eliminates all freight wastes.
3. Dimension production will concentrate total wastes at mills, thus making commercial salvage operation feasible.	3. Reduces the volume of stocks necessary to be carried.
4. Dimension production will effect very large savings in shipping costs.	4. Eliminates the necessity for extensive yards, and the fire hazard incident thereto.
5. Will relieve the abnormal pressure on high grade lumber.	5. Eliminates the old time "preparatory department" to a large extent, with all its wastes.
6. Establishes a series of production operations at the mill now carried on at much greater cost at the wood user's plant	6. Eliminates the problem of disposing of large quantities of waste.
7. In most mills would establish a year round operative basis, which will reduce overhead and stabilize labor.	7. Will doubtless favorably affect cost and speed of curing stock.
8. Provides a market for product of short logs, top logs, and all logs too small to produce FAS.	8. Will favorably affect overhead by reducing requirements for floor space, yardage, kilnage, light, heat, power and all similar charges. ed up in lumber piles
9. Gives production value to crooked logs, and the large branches of some hardwood trees.	9. Will reduce charges for capital now lock-
10. Will greatly reduce the cost of selling low grade lumber.	10. Stabilizes and standardizes basic cost of raw materials for related classes of production, for the entire industry.
11. Careful students believe that the opportunity which dimension production offers lumbermen as a means of adapting their output to varying market conditions will result most favorably in the direction of stabilizing the whole industry.	11. Affords production managers an established basis for gauging and speeding production.

As one looks over this rough summary at least one fact sticks out big and plain. It's a good proposition for all concerned. Just where the weight of advantage lies, time only will tell. Also time will adjust that advantage (if any) so that the whole problem will be on the same basis as ordinary transactions in commercial lumber.

How About the Price?

Somewhat with trembling and fear we approach this subject. But we have to admit that this thought is in the minds of all. What shall we pay for standardized dimension stock? Or, to put it another way—what price has the producer a right to charge? Without any question, eventually the price will be determined by the two factors of supply and demand, and its relative advantage to wood users as compared with commercial lumber. The usual sparring for price advantage is to be expected. Sometimes the market will be a buyers' market, and sometimes a sellers' market. No sensible business man would want anything different, under existing conditions.

Probably it would be a pure guess to make a suggestion for a basis—so to speak, a place to start from. Looking over past history; considering the parity of advantage that is likely to accrue both to producer and user of standardized dimension stock; having due regard for the ominous outlook for future forest resources; realizing that almost to a certainty the producer will protest "too low" and the user will retort "too high," and unitedly chase the writer to the tall timber; nevertheless said writer, speaking for himself only, elects to suggest this basis: "Let the parties at interest start the discussion on the basis of a parity in price beween No. 1 standard dimension and combined first and second grades of commercial lumber, applicable at the outset to the following industries: Furniture, Automobile, Wood Turning, Wood Shaping, Agricultural Implements.

Genenal view of office, plant and power-house, Langslow, Limited, Cobourg, Ont.

New Furniture Factory at Cobourg

Modern Well-equipped Plant Recently Put in Operation — Output Consists of School and Household Furniture — Interesting Outline of New Project

One of the youngest members of the Canadian furniture industry is the newly incorporated firm of Langslow, Limited, Cobourg, Ont. This company, which is the Canadian branch of the old-established Langslow-Fowler Co. of Rochester, N.Y., recently completed an up-to-date factory at Cobourg, Ont., and are operating it on an ever-increasing scale. Previous to the establishment of the Canadian business, the parent organization in Rochester had succeeded in working up a nice connection in Canada, especially in school furniture, and it was to take care of and develop this field that the Canadian company was organized.

The new plant, which is situated on the site of the old Crossen car shops, consists of a modern, well-lighted, two-storey factory, having a floor space of 26,000 sq. ft., a separate power plant and a two-compartment Standard dry kiln. In planning this factory, due consideration was given to future expansion, with the result that provision has been made for the construction of another unit of about the same size when found necessary. The site is an ideal one in many respects, as there is ample yardage and excellent rail and water facilities. The total investment is in the neighborhood of $250,000.

Flooded With Daylight.

The factory proper is of brick and mill construction. As will be noted in the accompanying illustration, the question of light has not been overlooked. The building is long and comparatively narrow, so that each machine is liberally flooded with daylight. The floor in the machine department is of concrete, while hardwood is used for the rest of the building. An automatic sprinkler system has been installed to lessen the fire risk.

The equipment is conveniently placed at one end of the lower floor and the remainder of the floor is used for assembling. A few machines were brought from the Rochester plant, but the bulk of them were purchased in Canada. A partial list is as follows: C. M. C. endless bed sander, Taylor revolving clamp carrier (power drive), Preston and C. M. C. band saws, C. M. C. resaw, Cowan vertical borer, two American horizontal two-spindle borers, C. M. C. glue jointer, C. M. C. straight edging and jointing saw, two swing cut-off saws with roller beds, three variety saws, two shapers, drum, disc and belt sanders, McKnight hydraulic bending press, Preston steaming retort, two planers, two buzz planers, special machine for shaping hollow chair seats, Dodds dove-tailer and several other pieces.

The second floor is used for finishing, storage and packing purposes. A spraying machine is being set up to help cut the finishing costs. An inclined platform, or ramp, connects the storage and packing departments with the shipping floor. With this inclined way it does not take long to move a carload of crated pieces down to the shipping platform.

Uses Electricity Entirely.

Electricity is the prime mover employed, the group drive being used. Seven motors have been connected up as follows: Three 50 h.p., one 20 h.p., one 15 h.p., one 7½ h.p. and one 5 h.p. For the present the juice is being purchased from the Hydro. Later on a steam generating plant will probably be set up. Both the power house and the boiler installation, which consists of two 150 h.p. boilers, manufactured by the Engineering & Machine Works of Canada, Limited, St. Catharines, Ont., is large enough to take care of the steam generating equipment. One of the boilers is being operated to heat the factory, dry kiln and glue pots and to provide steam for the steaming retorts in which the stock to be bent is treated. The power house and factory is connected by a tunnel running under the tracks which separate the two buildings.

The shavings and sawdust is conveyed to the power house by a shavings exhaust system installed by the Canadian Blower & Forge Co., Ltd., of Kitchener, Ont. Most of this material is conveyed direct to the fires as fast as it is manufactured, while a storage vault has been built to take care of any surplus over and above that required to maintain the necessary steam pressure. This surplus will be drawn on if found necessary to supplement the supply from the factory. For this purpose a small fan is being installed to lift the shavings from the storage vault and convey them to the fire box. The wood cuttings from the factory are thrown

in boxes or barrels as made and then conveyed to the boiler room or lift trucks.

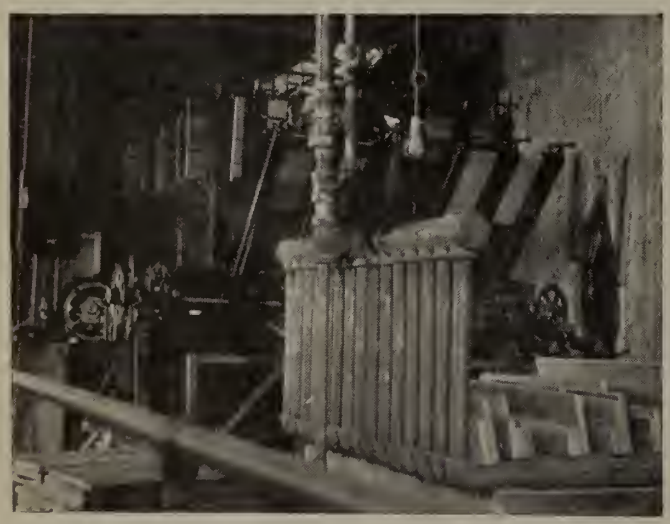
The demand for the Moulthrop school desk, which is one of the principal lines manufactured, is such that the present output is confined to the production of this patented school desk and a number of office and school chairs. The Moulthrop school desk, which is made in six sizes to accommodate scholars of different ages, is of the individual or unit type, that is, it consists of the chair and table in one unit. The table or shelf is adjustable for heighth and a commodious drawer is provided under the chair seat to take care of the school books, pencils, paper, etc. Quartered oak, in golden finish, is the wood used, although a few desks have been made of birch and finished in mahogany. The school chairs are made in quartered oak.

This line will be added to and it is expected that by fall the output will consist of a complete range of household furniture, including upholstered and wicker lines. The yearly volume of business covering all lines manufactured will in all probability exceed $400.000.

Trouble Securing Mechanics

Cobourg is not a woodworking centre, so that at the start some difficulty was experienced in securing skilled hands. This was aggravated by the fact that there was hardly a vacant house to be had in the town. A number of skilled mechanics were brought in and others less skilled are being trained in the ways of woodworkers. It is just possible that an industrial housing scheme will be undertaken to provide accommodation for some of the employees. The pay roll embraces about sixty hands. This number will likely be increased to 150 as the new lines are added and production increased. Another convenience for the employees which is under consideration consists of preparing and equipping a large athletic field and ball park at the side of the factory. This will enable the men to enjoy such games as baseball, football, tennic, etc.

The personnel of Langslow, Limited, is practically



Heater for warming stock, and Taylor revolving clamp

the same as that of the American Company, and consists of Stratton C. Langslow, president; Harry R. Langslow, vice-president and managing-director; Paul Knox, treasurer, and T. McKend, secretary The American organization makes about the same line and gives employment to 600 hands. In 1920 about 5,000,000 feet of lumber was worked up and the resultant product was valued at $1,500,000.

An associate company that gives promise of assuming large proportions is the Rice Lake Canoe Co., Ltd., Cobourg. This company was organized to purchase the canoe manufacturing business of Daniel Herald, including canoe designs and moulds, and the well-known Herald patent. This business, which has been in operation at Rice Lake since 1862, was taken over in 1920 and moved to Cobourg. A well-lighted, one-storey factory giving a floor space of 8,000 feet has been erected close to the Langslow furniture plant and the

C. M. C. endless-bed sander in Langslow plant

manufacture of canoes entered upon on a somewhat larger scale. All the machine work is being done in the furniture factory, but a new two-storey building, with a floor space of 15,000 feet, will be added to the canoe factory this fall, and when completed all the equipment required in the manufacture of canoes, rowboats, launches, etc., will be installed, making this operation entirely independent of the furniture plant. It is expected that the output of the enlarged canoe factory will run from 1,500 to 2,000 craft.

An attempt will be made to work up an export business, including a winter market in Southern Europe, West Indies and other countries similarly situated. If the demand during the winter does not equal production, other lines, such as skis, toboggans, hockey sticks, etc., will be manufactured.

The Herald patent covers a double-skinned cedar canoe. The lines and details of construction are such that this canoe is a prime favorite with sportsmen and canoe enthusiasts. Some of these canoes have given fifty years' continuous service. Other lines include narrow strip, basswood and canvas canoes. Later on the manufacture of rowboats, launches, sailing craft, etc., will be undertaken. The woods used in the manufacture of canoes are B. C. and Ontario cedar, bass wood, rock elm for the ribs, oak for keels, snout, etc., and such woods as walnut, cherry, mahogany, etc., for deck material. Every effort is being made to maintain and even improve the quality and reputation enjoyed by the Herald product.

The officers of the Rice Lake Canoe Co. are as follows: Harry R. Langslow, president and managing-director; Stratton C. Langslow, vice-president, and T. McKend, treasurer, and R. Ernest Gunn, Secretary.

Every machinist will be well advised to start the habit of collecting technical books dealing with the industry.

Cost Accounting in Box Factories

Ascertain Profit or Loss at Frequent Intervals — Normal Percentage of Overhead Should be Applied — Per Thousand Feet Not Proper Basis for Figuring Costs

By A. J. Redemski*

In taking up the subject of costs with the manufacturer, it does not take very long after the first interview to find that the box manufacturer is very anxious to determine the cost on every solitary, slight variation in his product. It is very difficult to step into a plan and start out with the making of costs in that refined detail, unless a certain amount of preliminary work has been done. That preliminary work must be done on the books of account, because those books of account are the record of your business. You have used those heretofore, at least most of you, I am sure, more as a matter of keeping track of your relations with your customers and with the people you buy from, to compile entries of account of the different commodities you buy, the aggregate of the labor that you expend and the other expenses that you incur; and, at the end of the year, you take these accounts and write them all off into a profit and loss account, in that way determining whether you have made or lost money for the year.

"Business, as it is conducted to-day, will not permit of such a long period of waiting before you can really ascertain whether you have made or lost money and it is necessary to make some other provisions.

First Points of Consideration

"Before we proceed further, we should define cost accounting as a method of accounting by which a manufacturer may ascertain precisely at short intervals the profits and losses that he makes and the sources from which they are derived. About the only thing that is necessary to do is to separate on your books those items, those accounts which represent the stocks of materials and unabsorbed expenses from those portions of material and labor and burdens that continually flow into that product.

"That brings us to really the first vision of our cost problem. We have certain items of stocks and materials that are bought from time to time, which are going to be used in subsequent periods. We want the cost of our products that we are manufacturing from time to time and only such portions of the materials as are used to be written into the cost accounts. The labor, of course, is an item that should be distributed between the different operations and in the aggregate also thrown into the cost account.

Keeping Track of Burden

"The burden is something, as you all know, that fluctuates a good deal and especially in times like the present it would be a very difficult matter, with curtailed production as is going on to-day, to absorb all of that expense in the current product. You would soon come to the conclusion that the business from a customer, which in ordinary times seemed to you always as being very profitable, to-day is absolutely unworthy of your effort. That is not correct; that is not true. If you were going to penalize that business —this business that you are getting to-day with these excessive overhead costs—why, you would not get any; you would never come back; you would never fill your plant to the point where you would be running at full production if you took that viewpoint.

"In order to determine what part of the overhead this current business should bear, having in mind the curtailed production which almost everybody is laboring under, we ought to get back to an earlier period and determine what amount of overhead we can operate with; and if we are distributing this overhead on the basis of labor, determine what percentage of that overhead normally is the labor and then apply that to business as it is coming in to-day.

Work With Different Groups

"In all of these operations in all of the plants that I have seen, of course, there is a great variety of product made; part of the product may be shooks; part of it may be nailed; part of it may be cornered; and where conditions like these exist it seems to me that it would be a good idea by making a cost first on those specified groups of business, so that those divisions, those principal divisions can be reflected on the books of account and shown without difficulty in a single figure. Then, as this part of the record is perfected, we can go to a study of the different operations. You can begin to analyze the product which takes more labor than some other and the product which takes less labor than some other. Then we can begin to build up a range in those different operations that will give us a proper charge for one type of box against another type. To begin to do that at the outset will lead only to confusion.

It has often been said that during such periods as came to an abrupt close in the fall of last year there is no need for costs. Product is marketed without regard to them. That is also true to-day. The effect of the comparative conditions is entirely different. Costs are necessary in all times, good and bad, because they afford a means of studying cause and effect, and through that knowledge will exert a tendency toward the establishment of more stable conditions. And so we draw upon the record of the past to determine what constitutes a fair charge for overhead or burden.

A condition was also possible during the past year which passed unnoticed because in most cases it was not analyzed. This grew out of the fact that stocks of material were acquired at favorable prices and were later sold, in the form of boxes figured at higher market levels. Consequently the business showed what appeared to be a very satisfactory profit. It is possible, however, that the expense of converting lumber into boxes was done at a loss and that a part of the profit realized from enhanced value of lumber was used to offset a loss from conversion.

"In some of the cost work I did, notably in one piece of work, I started by laying out this general principle. We must first get the general tendency of the business reflected on the books, and afterwards we could take the information that went in to make up this record and analyze it and then make our divisions. I had an assistant on this work who differed with me

*Address before National Association of Box Manufacturers, Chicago.

and he began to change this plan around considerably so that he would get the exact cost on every item of product. In carrying out this work during my absence he influenced several of the clerks that were working with him to that same opinion. Of course, the two systems would not work simultaneously and it was necessary to eliminate him from the job. Consequently these two youngsters who had been trained under his supervision were called in and told that if they had any grievances in connection with carrying out this work, as it was originally intended, now was the time to get them straightened out.

"In the course of the discussion that followed I explained to these youngsters that they were working in a business in which the principal material was lumber, a product of nature and that from it they could probably draw a good many lessons, the most important of which would be that no product of nature makes its appearance by the complete structure. It starts out first by developing a trunk which will carry the saps and properties that are necessary to a future development; and once that trunk has been properly developed it will shoot branches and they in turn leaves, foliage, flowers and fruits, all in their order. But to start a cost system and to put all of those refined fruits and flowers on at first, is not going to last; and they will wither. On the other hand, if it is allowed to develop in a natural order, the structure will endure.

Real Value of Cost Figures

"There is one other thing to be said in connection with the plan of getting these figures and this information into the books of account. By segregating on your books the elements of cost that made up the cost of your product during that period, you will show the fluctuating volume and you will show all of the properties that have entered the product during that particular period; and from those accounts you will be able to build up statistical records from which, in times like these, you will be able to draw lessons which cannot be drawn from accounts as ordinarily kept, in which the different elements of cost are just accumulated for a year and then finally written in the profit and loss account.

"The statistical value of those cost accounts will mean more to you as managers of a business than a detailed knowledge of the many items that go to make up the cost of a product such as you make, so that the message that I want to deliver to you is that very little progress will be made in cost work in this association until we definitely establish this accounting proposition and get our costs tied into the books, so that any analysis that might be made hereafter and that might be made from those figures will be a check and will be balanced against the aggregates that are shown in your accounts and the aggregates which you, as manager, know and can follow.

"You cannot follow all of those little items. You will call on your cost department for those from time to time as you need them; but if you have not got them tied up so that when they are given to you they will represent a known, balanced fact, they will do you very little good and for that reason I cannot urge too strongly and that ought to be the first step in cost accounting procedure.

Should M Feet Be Basis?

"In the many years that I have been in touch with the activities of the National Association of Box Manufacturers, I have always heard this subject talked about and I know it had been discussed for a good many years before I had any contact with it in this association; and yet we are not at any point of definite expression regarding the elements of cost. Most of you, I know, are to-day figuring your product on the basis of so much per thousand feet. I do not believe that you are ever going to come to a point where you can discuss the cost of the different types of boxes on that basis. I believe that you will have come to the point of saying that there is so much material there; for instance, the material cost is so much and the cost of sawing certain kinds of stock is so much per thousand feet, the cleating is going to cost so much per hundreds sets, the making up is going to cost so much per hundred, the wrapping and shipping is going to cost so much per hundred and the same way with lock cornered boxes and some of the other products that are being made; and you will have to say that it is going to cost so much to make a hundred sets of partitions for bottle carriers and a number of other items of that character.

"Some of you may be thinking in terms along that line now and you may have some definite ideas as to what those costs are in your plants. You may also have records by which you can tell how much product you have put through your plant and through the several operations that constitute the plant and, if you have, why do you not take those rates that you believe are fair for the doing of those operations and apply them to the volume of product during a year and then see whether those rates that you believe are fair are going to liquidate your entire labor and overhead figure during that period.

"Of course, you will say there will be some difficulty about it, maybe because you cannot tell exactly how many boxes you cleated or how many boxes you grooved or how many of the minor operations you performed; but try it in connection with your sawing and with your making up and with your lock-cornering and then you have the bulk of your production at any rate and can see whether you are getting anywhere near your actual expenditure for labor and overhead. If you will, why, then, you have a pretty fair basis on which to start. You will then know that any qualifications that you are making in the sale of that product are not very far off and which can then be corroborated by records such as I have explained in the foregoing."

WAGE REDUCTIONS HAVE BEEN GENERAL

Reductions in the lumbering industry are reported from New Brunswick, where one firm reduced laborers from $25.50 a week to $15. In British Columbia skilled hands have been reduced 10 to 25 per cent., and in some cases hours increased from 9 to 10 a day. Laborers have been reduced generally from 50 to 40 cents an hour.

In the printing trades slight increases are reported in Ontario points and in Winnipeg, and slight decreases in Medicine Hat and in Victoria.

Except in New Brunswick and Alberta, wage schedules in the building industry in all provinces show declines. In Prince Edward Island there is a general fall of five cents an hour in all building trades. In Quebec points, there have been a decrease of from 5 to 15 cents, while bricklayers earn $1 an hour instead of $1.25. Ontario points show declines ranging from 10 to 20 per cent., and the same is true of the important centres in Manitoba, Saskatchewan and British Columbia.

Upholstering and Trimming

Modern Upholstering

Outlining Changes and Improvements Covering Last Fifteen Years — Employment of Down Outstanding Development

In the upholstering of furniture there has probably been a greater development in the purely mechanical side of the trade during the last fifteen years than during any similar period since the invention of springs, this unusual development being largely due to the employment of down as a filling material, says John W. Stephenson in The Upholsterer and Interior Decorator.

Prior to the advent of down, extreme softness in upholstering could not be obtained with plain surfaces because the softest materials known, unless confined by tufting, would separate and sag, soon becoming unsightly and uncomfortable. This explains in a measure the tremendous vogue there was, in the latter part of the nineteenth century, for deep-tufted upholstering.

Various plans have from time to time been devised for the use of feathers and down, but the efforts to use these materials have been more or less experimental until the return to favor of the English and Colonial wing and cushion chairs about twenty years ago, which gave an impetus to the experiments of progressive upholsterers, and the down cushion as an adjunct to the upholstering of chairs and settees became a definite and permanent development.

Problems Encountered.

The application of down upholstering naturally varies with different types of furniture, although in many instances the frame construction of standard shapes seems to have been only slightly altered, and it is even possible to adapt, for loose-cushioned upholstering, frames that have not been made for that particular style of treatment.

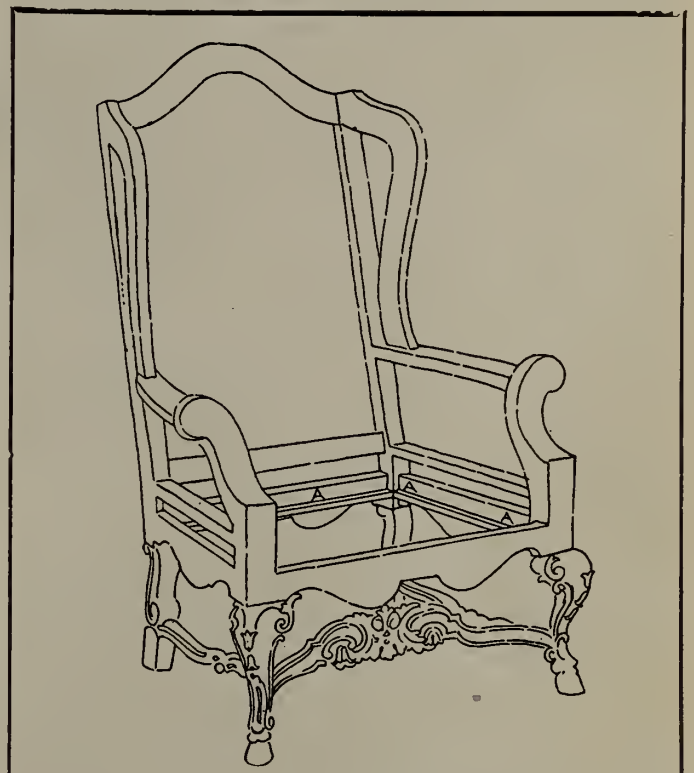
It should be borne in mind, however, that the limit of any type of cushioning is governed by the height of the seat of chair, settee or lounge from the floor, this constituting one of the chief contributing factors toward the comfort of the article when in use. To define the governing factors of height in general terms, the distance from the top of the finished upholstered seat to the floor should not be more than 18½ inches, and this only when the form of upholstering is very soft, such as down cushioning, which in use sinks to a point two or three inches lower than its finished height.

Even a solid wod set is sometimes made 18 inches from the floor, but greater comfort is obtained for continuous use in a much lower seat, and a chair recently designed for the use of industrial workers who are seated at their work, measured 16 inches from the lowest curve of the seat to the floor.

Provision for Fine Depth.

The matter of calculating for the use of down in furniture upholstering begins at the very genesis of the treatment of any particular piece. Starting with the chair shown in Fig. 1, the first consideration is given the webbing which supports the springs for the seat, this must be attached at a point as low as possible. This chair has a scalloped rail which precludes the possibility of employing a webbing stretcher. It should be made with the tacking strips indicated by A-A in Fig. 1, which enable the workman to tack the webbing at the bottom in the angle of strip and frame when stretching the webbing by hand, as shown in Figs. 1-A and 1-B. The webbing should be stretched as tightly as possible, with the chair upside down on the bench and securely tacked with both ends turned over the double tacked.

The webbed seat of the chair will appear as shown in illustration Fig. 2, the crosses indicating the posi



Details of frame of modern chair

tion of the springs. The webbing is shown in this figure without the interference of the chair frame so as to illustrate clearly the relation of the cross webs to the location of the springs.

Fig. 3 shows the position of the springs on the webbing, the circles indicating the bottoms of the springs, the first row of springs are hidden by the front rail of the chair, therefore they are indicated by dotted lines.

Spring Tied Down Low.

Fig. 3-A shows the position of the tops of the springs in their relation to the chair frame.

Fig. 4 shows the tops of the springs in their position after having been tied down. The tops of the springs are not usually permitted to be more than 1½ inches above the top of the rail, therefore, in order to give

sufficient slack to the twines when the springs are depressed, instead of being attached to the top of the rail, as in ordinary upholstering, the twines are pulled down to the bottom of the rail and there tacked, it being necessary, sometimes, to pierce the webbing in order to carry them on a straight line.

Fig. 5 shows a cross section, illustrating the method of tying the twines in relation to a single row of springs. The object of dropping the twines and catching the third coil on the front and back springs is to keep the spring surface of the seat as flat as possible. It is necessary, sometimes, even to pull down the tops of the springs to the webbing by long stitches in order to maintain a flat surface.

Fig. 6 shows the seat of the chair after canvassing over the springs. The edge of the canvas being tacked as low as possible on the rail as illustrated in cross section Fig. 7, or tacked on top of the rail with a gutter being sewed to the webing as indicated by the stitches a-a-a-a.

A HABIT IT HAS.

A safety director tells this one apropos the difficulty of teaching some people to observe the rudimentary principles of "safety first."

Wash White got a job in a sawmill. The boss put him in charge of a buzz saw, showed him how the saw worked, warned him of its dangers, and then went away.

Wash was fascinated by the shining whirling saw. But was it, truly as sharp and terrible as the boss had said? To test it he touched it gently with his finger. Zzz! and the finger was no more.

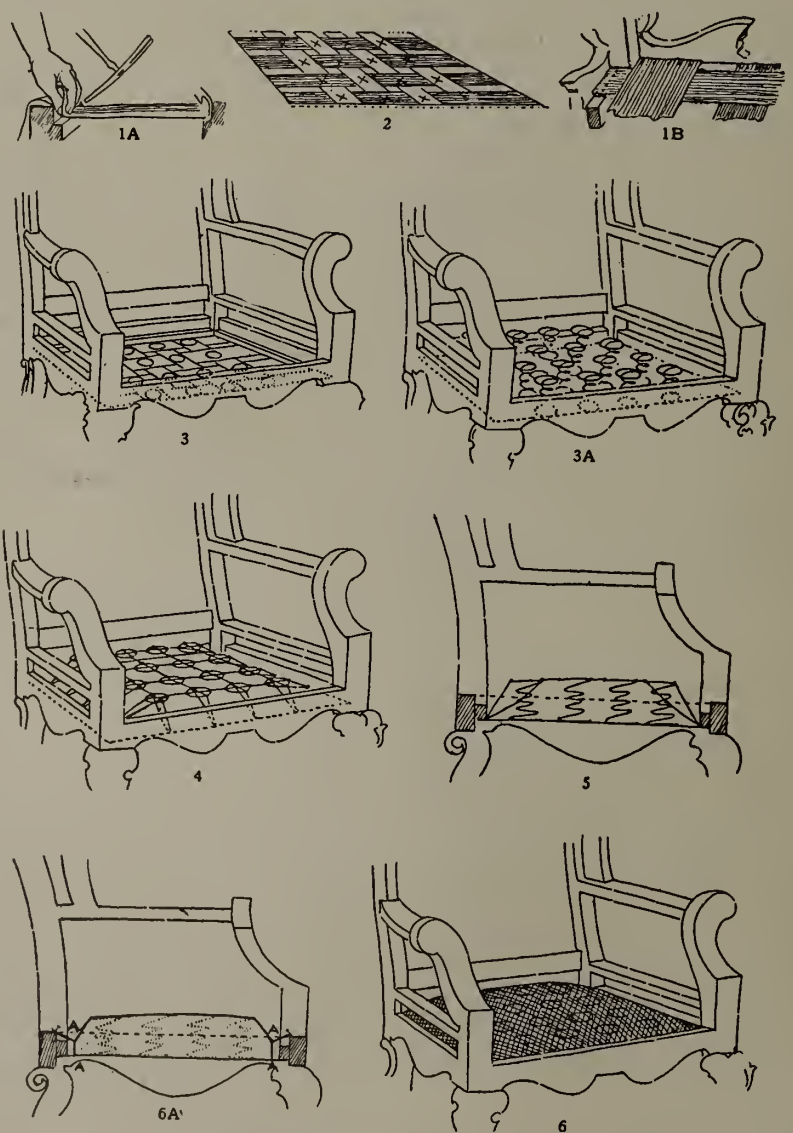
As Wash was ruefully tying up his hand in his bandana the boss came back.

"Hullo there, Washington. What's the matter?"

"Buzz saw done cut off my finger, sah."

"How the dickens did that happen?"

"Ah dunno, sah," said Wash. "Ah just touched de darn contraption like this an'—Fo' de land's sake, der's anudder gone!"



Building foundation for down filling

COMPLETES ATTRACTIVELY FINISHED OFFICES.

An attractive office building was recently completed by the Watt Milling & Feed Co., Limited, who operate a planing mill and woodworking plant in Toronto. The structure is a brick building 40 ft. x 35 ft., two storeys high. The upper floor is fitted up as apartments, which are occupied by two of the office staff. The lower floor is the office proper. This is attractively finished in oak and face brick. The street wall is a large plate window, and the entrance doors are situated at either corner. Upon entering one is confronted with a hand some oak counter, extending the full width of the office and flanked by some well-matched oak panel work on either wall. The counter itself is worthy of special mention, as it is a piece of high-class woodwork. All the woodwork, interior fittings and office furniture, with the exception of the desk chairs, was designed and constructed by the woodworking branch of their business.

At the rear of the oak counter are four private offices. These are finished in oak panel work on the outside to conform with the general decoration scheme of the office. The interior of these private offices are panelled in different woods as follows: Chestnut, walnut, mahogany and figured red gum. The idea back of this is that it enables them to show a prospective customer how panel work looks in the different woods and thus assist in making an intelligent choice.

The basement is fitted up with wash and locker rooms, also a large lunch room, in which has been placed a kitchen cabinet and a gas range. This is for use of the office staff. The foundation and construction is such that a number of additional storeys may be added if required.

MAHOGANY ASSOCIATION FORMED.

The American importers and manufacturers of mahogany met recently in New York to consider the advisability of forming an association consisting of those interested in the mahogany industry. Those in attend ance were unanimously in favor of perfecting such an organization and a substantial sum was subscribed to start an educational campaign. One of the first duties of this organization would be to launch a national advertising campaign with the idea of calling attention to the many merits of genuine mahogany and to warn the general public against substitutes masquerading under the names of "birch mahogany" and "mahog any finish." R. S. Huddlestone acted as chairman of this new organization, which is to be known as "The Mahogany Association."

DISSTON SALES MANAGER DIES SUDDENLY.

Only one incident occurred to mar the happiness of the 24th Annual Convention of the National Hardwood Lumber Association, held in Piladelphia, Pa. This was the death of E. F. Cooper, Mill Goods Sales Manager for Henry Disston & Sons, Inc. Mr. Cooper had at tended the annual banquet of the association, held in the Bellevue-Stratford Hotel, on Thursday evening, June 9th. He engaged a room for the night at the Manufacturers' Club. Friday morning, June 19th, at about eight o'clock an attack of acute indigestion caused Mr. Cooper to telephone for a doctor. He was dead when the doctor arrived.

Finishing by Acid Method

Acid Hardens Shellac Giving Durable Finish Improvement Over French Polishing

In the manufacture of cabinet furniture in particular one notes that the goods from foreign sources, the French, English and German specifically, bear very distinct features, so that the expert in such matters is able to tell at once their origin. Design, construction and finish are noticeably different in each case, and as to the finish, that is especially distinct.

With the French finisher originated the polish finish known as French, or, as it is usually written, French polishing. The German finished employed this same method for some years, though in a somewhat different manner; this difference consisted in the generous use of pumicestone and rubbing in the start of the work, whereby they got a perfectly level surface, which was very much thinner in body than that made by the ordinary method. But this was used only on high-grade goods, such as would warrant the increased expenditure of time and labor.

Advantages of Acid Method.

The German also used a purer spirit for dissolving the gum, and from this one might reasonably conclude that the finish would be more durable than that ordinarily produced, both by the French and the English (who also adopted the French-polishing method), and also that the finish would be more excellent, owing to the greater amount of work put upon it. That this was not the case cannot be ascribed to the manner of application, for it is presumable that these three countries, equally famous for fine work, used the same method and about the same kind of materials.

That one may determine the source of manufacture of the three lines of cabinet work or furniture by the finish may seem doubtful, yet there is a mystic something in the appearance of each that tells the story. It is impossible to describe it in words, but there is a difference in the effect seen.

It is now in order to say something concerning the matter of using an acid in the finishing, as the title of this article suggests. It originated with that technical and scientific race, the Germans. But first let us note that in the work of wood finishing and polishing it is unfortunately necessary to employ some oil, just a little, it is true, yet enough to cause trouble to the finish. In the distribution of the polish liquid it is necessary to use oil, owing to the nature of the polish, which is made up of gum shellac, and in some cases with the addition of some other gums, all of which are dissolved in alcohol, and the composition is, from its spirit nature, short and hard to work without the help of the oil.

Used in the greatest degree of moderation, there would still be some difficulty, but when used as it is by some careless workmen, in order to make the work of spreading and rubbing easy, the result is very bad. Some gums work stickier than certain others; then some brands of alcohol will work very much better, or easier, than others, requiring the minimum quantity of oil; other kinds of alcohol, even though the same grade, say grain spirits, will cause the polish to work hot and dry, as the workmen term the effect. The result in the latter case is seen in the too rapid drying out of the polish, leaving the finish dead, and the oil enables it to clear out bright and fine. But too much oil must be avoided.

Increases Durability.

Just here we may observe that in the use of an oil it has been found that poppy oil does rather better than linseed oil. But no mater what oil, there is sure to be enough left on the work, either under the polish, or mixed with it, to cause sweating in time. In most cases, as it works out, the oil breaks up the shellac film into an appearance similar to cobwebs, looking like cracking of the surface. Now, unless this effect is cleared off immediately, these lines or marks will get hard, in the form of minute ridges, which will catch the dust as you clean the surface.

The oil does not, of course, dry quickly, as the polishing liquid does, and the condition of the weather, too, may influence the result by retarding the drying of the oil. Here, then comes in another trouble for the finisher. The appearance of a very slight degree of heat, continued for a few days, as in summer, will suffice to soften the shellac, and as it softens up again it sinks into the wood, on some kinds of wood to the extent of forcing the filler out. Finally, the effect thus produced is that which one might expect when done by an inexpert workman, for the work will have an unfinished appearance. This is particularly to be observed on work faced with very thin veneer.

Conceding, as has been suggested, that the German workmen used a superior grade of spirits, yet they did not entirely escape the difficulty which we have just described. But they were not long about discovering a practical way of overcoming the trouble. This way, to a very great extent at least did overcome the evil; it was known as the vitriol finish, or acid finish. While this was certainly a great achievement, yet it only partially accomplished the purpose that it was designed for. It made no provision for the sinking in and loss of gloss caused by a wave of heat or by the overheating of the room with gas or coal fires Neither did it prevent the perishing of the polish, when a humid condition prevailed.

Build Varnish Body.

Recognizing the extent of the inefficiency of the acid method, the German went one step farther, by doing away with shellac finish on all high-grade goods and employing instead successive applications of copal varnish. Each coat of this varnish was given ample time for drying and becoming hard, in order that the surface might be sufficiently hard to permit of rubbing down to a perfect level with felt pads, using flour pumicestone and water. This operation was repeated four or five times, after which the French-polishing

began. The lusterless surface was treated with a polish formed from bleached shellac, dissolved with a very little more oil: than is generally used in the regular French-polishing process.

This sort of finish may very properly be termed the polish on varnish finish. But there is a difference that should be noted here; the application of the polish is not carried out to its fullest extent; that is to say, the final luster is not obtained by the spirits alone. The polishing is proceeded with to a stage when it is just ready for clearing out the oil and bringing out the lustre with spirits. Instead of using this, the work is pounced rather liberally with precipitated chalk. Then, having at hand a suitable vessel containing sulphuric acid diluted with about ten parts of water, the workman dips the palm of a perfectly clean hand into the acid water, and with this he proceeds to rub the precipitated chalk with a circular motion, applying enough of the acid to cause the chalk to assume a creamy paste form; he continues rubbing, using the finger tips to get the creamy chalk well into the corners and into the moldings, until the chalk becomes dry. Then the final lustre is produced by hand-polishing. The acid possesses the property of hardening the film of shellac, while the chalk brings away any oil that may be upon the surface; it also serves as a polisher.

It will no doubt occur to the interested reader that dipping one's hand in sulphuric acid, even when diluted with water, may not be free from certain pos sible ill-effects to the cuticle thereof, and where this feeling exists it is good to know that the hand may be saved by the use of a most efficient substitute, a soft quality of chamois leather.

Excellent Finish Results.

From what has been stated in the foregoing article it will not be difficult to understand that the essential principle of this acid process lies in the fact that only a small proportion of shellac is employed. Hence there is a lessened liability of a great degree of the softening thereof. Then the successive coatings of hard copal varnish, rubbed and made smooth, entirely prevent the oil from entering the wood or filler beneath. Hence sweating is about prevented.

Finally, let us note that the method brought about an entire change of the method of imparting color to the work, in staining, for the coloring or staining must be done before any varnish is applied. otherwise it would be rubbed off, especially along the edges, when rubbing down with the pumicestone and water, with felt pad. In the real French-polishing the color is applied with the polish, but were we to do that in the acid method, where the color would have to be placed on the copal varnish surface, the acid would bleach the color, unless the acid were extremely dry; aniline colors especially would be thus affected.—"Veneers," Indianapolis.

ASCERTAINING STEAM CONSUMPTION OF KILN

A very simple arrangement for ascertaining steam consumption in a kiln is used by a large American woodworking firm. For several years it has periodically weighed all the condensation formed in a kiln during the whole drying cycle of a particular species or grade of lumber, often a period of six days and nights.

In order to do this it cut the heads from two iron oil barrels; put a drain valve in bottom of each; then connected each trap on the kiln to be measured (it uses a separate trap on each header, or three to each kiln) with a rubber hose so it would discharge into the barrel. As soon as first barrel is full (say fifty-two gallons) time is noted and the hose is changed to the second barrel. Time used in producing fifty-two gallons of condensation varies from six to forty-five minutes, but night and day this time is accurately noted for the entire drying cycle.

Given the gallons of condensation produced in a period of four or five or six days, the balance is simple arithmetic. First take the average temperature of discharge water (about 200 degrees) and allow weight a gallon at 8 to 8.25 pounds, according to tables. This gives total pounds for condensation for period. From this basis we figure the horsepower an hour used to dry the lumber. The pounds of steam used to evaporate the moisture from a weighed crib and much other instructive data are obtained, which all assist in producing good, thoroughly dried lumber.

The days of hit-or-miss kiln drying are past; lumbermen have ceased figuring that a bunch of steam pipes in a building will automatically dry lumber without tremendous degrade. On a kiln operator's knowledge of the exact condition of the circulation and drying condition of the lumber at every stage depends the quality of the lumber produced. All tests of both circulation and humidity must, of necessity, be made inside the kiln with the doors closed. With temperatures around 200 degrees and heavy humidity, this is very unpleasant, and it is mainly these unpleasant conditions which cause many kiln operators to take for granted that conditions are right, when actually the lumber is laying dormant, or casehardening through lack of humidity, preparatory to coming out checked, stained or kiln burnt.

Therefore all the knowledge an operator can gain relative to amount of heat to which the lumber in all parts of a crib is subjected, and the variations in speed of drying caused by movement of lumber, is all too little on which to base any definite statement as to conditions and chemical changes which take place in the lumber, but constant observation inside of kiln helps considerably.

RAW MATERIAL MARKET.

The prices below are taken from reliable current market reports. They are not quotations, but facts—that reflect the trend of the raw material market.

Linseed Oil, single bbls	gals.	$0.80 to .84

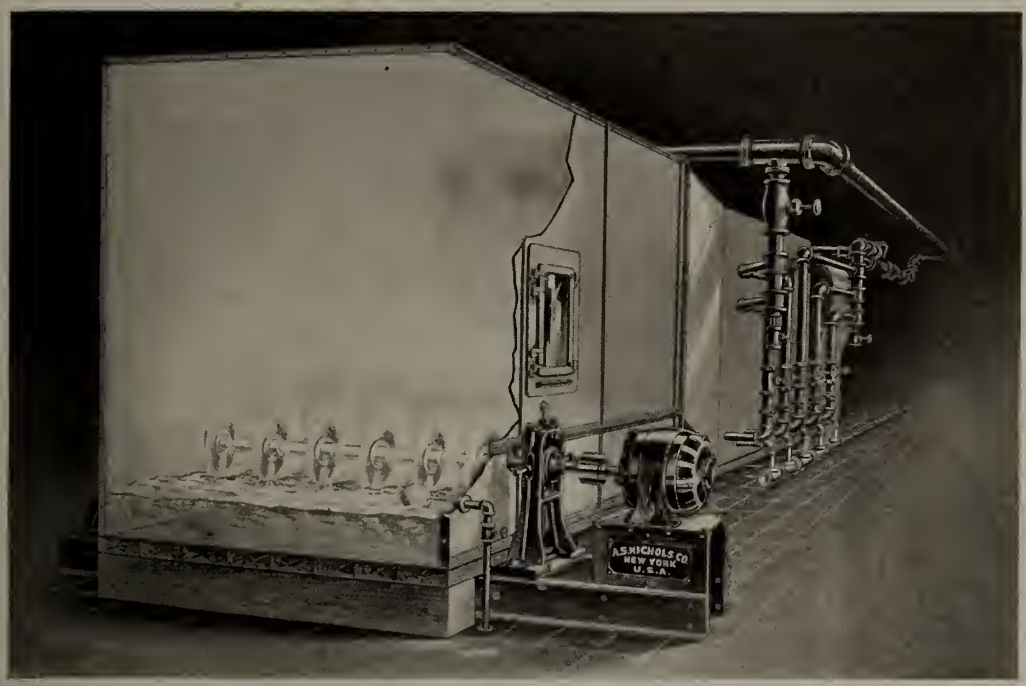
The Nichols' Varnish and Paint Dryer

A complete unit of fan, motor, heaters, air compressor, with automatic humidity and temperature controls.

A new rotary humidifying air washer, which eliminates all dust and dirt, does away with all spray heads, pump and connecting piping.

Manufactured in sizes suitable for all requirements.



DO YOU KNOW:

That the finest pianos, talking machine cabinets, furniture, and automobiles are finished by this method?

That the finish can be dried cleaner, faster and better in this way than by any other method? That the work is more durable and stands up better?

That all varnish shrinkage takes place in the DRYING ROOM, coat by coat, during the drying period, and not days or months later in show room or home?

That on cold mornings the finishing room can be quickly warmed, increasing comfort of men, coating efficiency, and condition of varnish?

That the finishing room can be properly ventilated and the health, working conditions and comfort of the workmen much improved?

That these results are obtained the year round, in Summer and Winter(irrespective of outside weather conditions?

That the investment pays for itself in one year or less?

These are FACTS and guaranteed by the A. S. Nichols Company, Sole Agents for all territory East of the Ohio, Mississippi and Detroit Rivers, in the United States and Canada. We are prepared to answer questions and quote prices on any drying problem. Communications covering varnish drying propositions west of the above mentioned territory, should be addressed to the Drying Systems Incorporated, Chicago, Ill.

We also continue to manufacture the Nichols' lumber and veneer dryers that we have been making for over thirty years.

Science of Moisture Control

Equilibrium Moisture Content Correct Basis — Wood Moves Only When Absorbing Moisture or Drying

By J. F. Hirt, Forests Products Engineerng Co., Chicago

The title of the subject, which your secretary has permitted me to select, indicates to my mind by far greatest cause for the many difficulties and astounding losses encountered in the manufacture and use of lumber and veneers.

Unquestionably the greatest stimulus toward the solution of these important problems was created by the government through the U. S. Forest Products Laboratory at Madison, Wis. Uncontrovertible facts now make possible a full solution of the many problems encountered, and provide a fundamental knowledge with which to proceed and prove in practice much that has been unknowingly and unjustly termed "imprac tical theory."

In order to make this discussion as clear as possible to everyone, I have deemed it advisable to construct a foundation of facts, some of which may seem more or less elementary to those among you who have studied this important subject.

It is a well-known fact that a single fibre of wood will not change its shape to any appreciable extent unless it imbibes moisture when it will expand, or unless it gives up moisture, in which event it will shrink. It follows then that the degree of expansion or shrinkage of the single fibres in a board or piece of veneer of any particular size. The thermal expansion and contraction is so slight that for our purpose we can ignore it entirely.

We first must deal with the natural, inherent moisture of our timber as it is manufactured into lumber or veneers. In manufacturing veneers this problem is more simple, since you receive your logs nearly green from the tree and, therefore, practically all shrinkage resulting from evaporation of moisture is within your control. To take advantage of this requires thorough knowledge of what takes place in lumber and veneers while the moisture is being reduced.

How Moisture Is Held.

Many manufacturers express astonishment when they learn that some species of wood contain 200 per cent. moisture in their green state. Certain species contain even more, 250 per cent. being near the limit.

This moisture is contained in two known forms: Free and fibre moisture. The former is contained in the open cells or pores of the wood and constitutes the bulk of the total moisture. The latter is contained in the actual fibrous structure of the wood, and, with the exception of a few species of wood, can be safely stated to be about 30 per cent.

A sharp distinction must be drawn between free and fibre moisture since all the shrinkage occurring in the elimination of moisture occurs during the reduction of fibre moisture, and after the free moisture has been evaporated. This is quite general, but there are, however, a few exceptions to the rule with which we will deal here. Expansion of dry lumber and veneers can only take place when the moisture content is raised, but again, no further expansion takes place when the fibre saturation, that is 30 per cent., has been reached. We now reach the conclusion that all so-called "working" in wood takes place during changes of moisture content between oven dry and up to 30 per cent., or fibre saturation, with the exceptions previously mentioned.

Just what chemical and certain physical changes take place during moisture changes is not definitely known but we are really more interested in the structural changes and this has now been solved to a near state of perfection.

The fundamental principles of reducing and controlling moisture in veneers are identical with those applied to lumber, the only practical difference being that lumber requires more time and in approximate ratio to thickness. In working lumber you purchase your waste by cutting off the checked ends of boards and planing a 4/4 in. piece down to 5/8 in., if it will not make 11/16 in. or 3/4 in. core or other dimension stock. With veneers you lose through checking and principally through severe "buckling" and consequent breakage.

Guessing Not Permissible.

In the past we have talked of kiln drying lumber in terms of time in days required to dry a certain kind and thickness, without knowing the moisture content of the stock before placing it in the kiln, either guessing at the final moisture content, or, as in many other cases, making erroneous tests. Very few manufacturers are donig this correctly at the present time. Much less is being done in the control of moisture in veneers. They are usually died by mere guess work, and herein lies perhaps the greatest source of loss.

It is decidedly incorrect to reduce veneers to an oven-dry state, because they cannot possibly remain flat when they again imbibe moisture. Considering the fact that any piece of lumber or veneer is made up of innumerable fibres and that these are distributed very non-uniformly, at the same time accepting for the moment the theory that any one fibre has approximately the same power to imbibe and give up moisture as another, it becomes quite apparent that board and, more especially, a sheet or piece of veneer, cannot possibly remain flat during moisture changes unless it is held or rather stressed into a flat position. Naturally the particular spot in an over-dried piece containing the greatest number of fibres, in other words, the most dense spot, will take on the greatest amount of moisture and thereby very obviously will produce local expansion, more commonly known as a "buckle."

No doubt you have all noticed a greater depression around a knot in a dried board. This is undoubtedly due to a greater density of fibres around the knot, each

having given up its own share of moisture and consequently proportionately greater shrinkage has occurred. This is a somewhat exaggerated example of the non-uniform density of timber and, for that matter, a sheet of veneer may have no knots at all and yet "buckle" beyond a point to which it would be practical to use it without further treatment.

Tendency to Warp.

Other causes of unequal shrinkage are due to the natural general formation of fibres in the tree A very good example of this can be observed in any telephone line pole. This shrinkage is evident in the form of large checked openings on the outer surface which grow smaller toward the heart of the tree. A single board, cut from any particular portion in the tree and left to dry out without piling or providing some other method to hold it in a straight position while drying, will shrink very nearly as indications would suggest in the telephone line pole. This indicates two directions of shrinkage which we need to consider here; they are commonly known as radial and tangential. For practical purposes longitudinal shrinkage need not be considered except that it must be recognized in panel constructions known as concealed or exposed crossings and in all banded types. The radial direction in a quartersawn board is with its width, while the tangential direction is through its thickness Lumber shrinks approximately twice as much in the tangential direction as indicated in telephone line pole example

Since the wood is quite elastic, it is entirely possible to dry it in a straight condition without producing any other ill-effects aside from natural shrinkage. In other words, lumber and veneers must be held and stressed in a straight, flat position while the moisture is being reduced to exact requirements.

The solution of this problem lies in having at all times an exact knowledge of the atmospheric conditions throughout the drying period and during the process of manufacture. It is common knowledge that oven-dry lumber and veneer will imbibe or pick up moisture from the air but to be exact we must know just how much it will pick up. When the product ceases to give up or take on any further moisture it is said to be in equilibrium with the atmosphere. An impirical term which we have coined for this condition is E. M. C., meaning Equilibrium Moisture Content.

Equilibrium Moisture Content.

It is well recognized that the E. M. C. changes not only from one season of the year to another and would be different in various localities, but also needs to be known in the individual plant however, it is entirely practical to work out standard drying and moisture control practice based entirely on this condition.

Once you have determined the average E. M. C. in your plant, you know definitely to what moisture content your stock must be reduced. Adjustments may need to be made during seasonable changes, especially in the colder climates where we are required to reduce the outside atmosphere already low in relative humidity, by heating it to a comfortable working temperature in the plant.

Some consideration must also be given the nature of the product, its use and where used, so that under certain circumstances it would be advisable to control the E. M. C. during the entire year. This would not, however, be common practice, since there is another factor working in our favor at all times, which is the particular type of construction used in panels, furniture, and, for that matter, all wood-work composed of more than one piece, which will permit balancing of stresses, shrinkage and swelling.

In establishing the E. M. C. for your particular plant and product, it is first necessary to make extensive tests. These can be made by taking a number of oven dry cross section pieces of 4/4 in. board about ¼ in. in the direction of the grain and suspending them in different rooms in your plant. After a few days they can be tested in the same manner as ordinary tests on lumber would be made to determine the moisture. The results of repeated frquent tests will permit you to work out an average E. M. C. which can be generally maintained at least during our extreme opposite seasons, summer and winter, providing, of course, that your entire product, or a valuable portion thereof, is not shipped to an extreme climate, in which event the E. M. C. would need to be adjusted to make up for at least a portion of the change. As an example, a manufacturer of furniture whose plant is located in Denver, Colo., where the E. M. C. in the open is very low, would get into much difficulty if he shipped his product overseas, unless he made provision to hold the moisture content of his material and finished product proportionately higher. I do not mean by this that the product would need to contain anything as high as the E. M. C. on ship-board as this would be 18 per cent. or more. The exact E. M. C. in this case would be dependent upon conditions at final destination, the construction of the product and its intended use.

(Concluded in August issue.)

Australian Artificial Veneers

A recent Australian invention of an artificial composition similar to veneer should be of interest to manufacturers in proximity to large supplies of waste material of vegetable origin, such as sawdust, says Commerce Reports. As patent applications are pending in Australia and other countries, the inventor is at present reticent in furnishing details other than that the substance is worked up entirely from waste fibrous products and other vegetable matter, and that sawdust can be utilized in considerable quantities in the manufacture of the cheaper grades of the composition. The Canadian trade commissioner at Melbourne describes the product in the following terms:

The substance—named "Keltona"—can be used for a variety of purposes, such as chair backs and seats, furniture generally, veneers and wall and other panelling, and can be produced to represent excellent marble effects. It is capable of being bent freely for a variety of commercial purposes, worked with tools, sawn, bored, planed, sand-papered, etc., and will take nails with ease.

SAWDUST FOR GRAPE PACKING.

Californians who pack table grapes for shipment have shown preference for redwood dust and made large use of it, but the supply may fall short, and as a provision against emergencies experiments have been made with sawdust of other kinds. Satisfactory results have been obtained from spruce dust; and results only a little less satisfactory have been obtained from Douglas fir. Sitka spruce, the species from which most of the sawdust is obtained, grows principally in Oregon, Washington and northward, and the dust must be hauled 500 to 1,000 miles to reach the principal centres from which grapes are shipped. The average haul is twice as long as that of redwood sawdust.

Two Generations of Honest Business

have resulted in the upbuilding of a veneer and lumber organization which we now feel many buyers may be interested in. The history of this business, which during forty years has been producing a line of highgrade Oak Veneers, Hardwood and Yellow Pine Lumber is inseparably linked with the best traditions of the famous hardwood operations of Indiana. Its facilities pictured herewith are a monument to successful and honest business. These facilities have been sufficiently expanded so that we are now pleased to announce to the consuming trade our ability to handle the business of a few more discriminating buyers. This announcement is especially directed to those who will appreciate relations with a producing organization which long since earned its reputation for strictly reliable product and service.

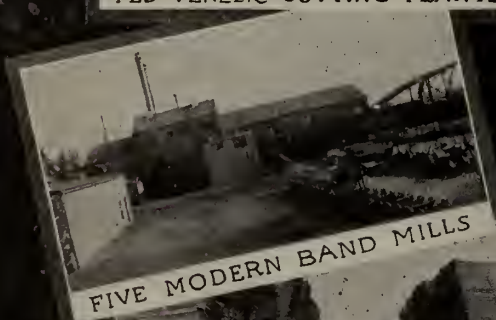
Some Reasons why Wood Mosaic Quality is Consistently High

SPECIALLY DESIGNED DRY KILNS WITH 500,000 FEET MONTHLY CAPACITY

THE MOST PERFECT POSSIBLE VENEER DRYING EQUIPMENT.

A LOG SUPPLY SELECTED BY 20 EXPERIENCED BUYERS

PERFECTLY BALANCED AND EQUIPPED VENEER CUTTING PLANTS.



FIVE MODERN BAND MILLS

THOROUGH CARE AND EXPERIENCE IN HANDLING LUMBER

An organization complete in all details is a guarantee of correct product if properly operated.

Some organizations grow haphazard, expanding here and there at random and making impossible a co-ordinated whole. The operations of the Wood-Mosaic Company function with precision because every step has been part of a well-conceived plan. The basic thought is a plant for each type of production. Thus, every foot of Wood-Mosaic hardwood lumber and veneers in walnut, oak and poplar is produced in a plant designed especially for the manufacture of each class of product.

This holds from the logs, which are the careful selection of a trained corps of twenty timber buyers, through the final operations of handling the manufactured product, special equipment having been provided for each unit of manufacture so that the lumber and veneer product may be always correctly dried and further prepared for consumer's use. We solicit the opportunity of demonstrating the value to you of such an organization.

ALGOMA *the Better* Plywood

Credit where credit's due!

Credit for originating stock sized panels belongs to the Algoma Panel Company. This idea, now widely used, has saved manufacturers many dollars by saving on costs of production through standardization.

Credit for increased profits can be entered on your books by the adoption of Algoma stock sized panels. ALGOMA, THE BETTER PLYWOOD, is made up ready for delivery in panels of the following stock sizes:

24 in. x 60 in.	3-ply ¼ in. thick	24 in. x 72 in.
30 in. x 60 in.	5-ply ⅜ in. thick	30 in. x 72 in.
36 in. x 60 in.		36 in. x 72 in.

This is only one of the many ways in which the interests of our customers are served. You can secure the benefit of our 35 years of careful manufacture by adopting Algoma the Better Plywood, for every purpose. Let us give you estimates.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

Peculiarities of Quartered Oak Veneers

Ruptured Fibres Not Confined to Rotary-cut Material — Each Wood Presents Different Problems — Good Results Require Close Attention to Every Minutest Detail

By R. N. Y.

The majority of troubles encountered in the different veneering operations look simple enough, but when we attempt to remedy them, we are often confronted with a more difficult problem than we thought possible. It is commonly assumed and is in many cases true, that many of the difficulties encountered are due to the application of rotary cut veneers. For this reason the many articles dealing with the elimination of veneering troubles have dealt almost exclusively with overcoming the troubles common to rotary cut stock. In fact, it has become quite common in some plants to assume that the use of sliced or sawn material is the easiest way of eliminating the troubles referred to. Some go a step farther and consider that certain woods are so easily handled and worked, particularly if they happen to be sliced or sawn, that very little attention is given to the way in which they are handled and applied, with the result that many of what should have been choice pieces of furniture, veneerd with the most beautiful examples of our native veneers, have lost their value because of carelessness in the matching and application of the veneers.

In this article we will endeavor to deal with some of the problems encountered in the application of sliced or quarter sawn oak veneers. One of the contentions in favor of quarter sawn or sliced oak is that this method of cutting does not fracture and break the fibres the same as the rotary lathe. This is not altogether true. Quartered oak veneers are never rotary cut, yet one sometimes finds whole shipments in which the grain has been broken as on the lathe. Part of this may be due to inexperience on the part of the manufacturer or the operators in his plant.

Special Attention to Stock.

Veneer of this kind will give as much trouble from checks, etc., as any kind of rotary cut stock. This holds true whether the material is laid right-side up or not. When handling stock that shows imperfections of this kind, one must take great pains to make sure the best side is laid on top. On a wide face requiring several pieces of veneer, owing to the fact that some of the stock cannot be reversed to secure a good match, considerable pains must be taken in selecting and matching the pieces.

It is said that some of the quartered oak now being turned into sliced veneers should have been manufactured on the veneer saw. This may be illustrated by referring to the hand plane. If you have a piece of quartered oak in which the grain is twisted and appears to be running in all directions, you will find that it is almost impossible to smooth up same without tearing the grain in different parts. In slicing, the work is practically the same. Some manufacturers claim that the percentage of oak logs suitable for sliced veneer is not over 75 per cent. of those handled. The remainder should only be manufactured on the saw. It stands to reason that a plant slicing all kinds of oak logs is bound to produce a quantity of face veneers that should not grade No. 1. Much of this material, when laid, will develop flaking of the splash or figured grain, some of the finest pieces being rendered entirely useless on this account.

Apply Good Glue Size.

In an endeavor to prevent trouble of this kind a good idea, one that has been followed by several large concerns, is to thoroughly examine all panels laid with quartered oak after they have been dried and are about to be taken to the sander. It is easier to distinguish the ruptured flakes and faulty pieces before the sanding has been done. All panels in which defects are found should then be coated with a glue size mixed to the thickness of ordinary buttermilk. When this has dried perfectly the panels may be sanded. If one coat of size is not sufficient to overcome all the trouble, a second application may be made. However, it will be found in the majority of cases that one coat is sufficient.

This same trouble is sometimes experienced with sawn quartered oak face veneers. This usually occurs in a plant using the hot plate type of drier and is caused by handling the quartered oak stock in the same manner as ordinary veneer.

This class of material can be dried successfully in a hot-plate drier, but should be allowed to remain only for half the length of time in the machine and then run through again for a final drying after an hour or two has elapsed. Another way is to cut down the temperature of the plates one-half and allow the stock to remain in the machine double the length of time ordinarily given to common material.

Steam Ruptures Fibres.

The reason for this procedure is that when quarter sawn veneers, containing a high percentage of moisture, are being dried, the steam generated from the moisture in the plates or splash grain is not thrown off as quickly as that generated in the rest of the wood and the result is that the flake becomes ruptured or practically explodes. This is easy to understand when one considers that the fibres of the flake are denser and more solid than in the rest of the piece.

These flakes usually blister up and are readily discernible before laying. In most cases this blister is not much thicker than a sheet of newsprint, and if the veneer is 3/32 or thicker it will generally sand off, leaving a smooth surface. If the blistered side should be laid down, the glue will not be able to get a good grip on the solid wood, and loose spots or blisters will result.

This goes to show that without regard to what kind of veneers are being used, whether they are rotary cut, sliced or sawn, vigilance should be the guiding star of the men doing this work. If this idea is followed much of the trouble so often encountered will be eliminated from the veneer room.

The quality of a belt depends on its power to retain the fastener for the two ends, its suppleness and its evenness of running, combined with a grip like a limpet.

WE would like to take all of our customers over our plant in Baltimore. We know it would interest them to see *how* we produce QUALITY VENEERS in Walnut Butts, Mahogany, Burls, Long Walnut, Oak, Poplar etc.

A "Personally conducted tour" being out of the question, however, for more than a limited number. we will try to give an idea of the plant by means of a series of pictures.

VIEWS OF OUR PLANT No. 1. H G W feat

JUNE VENEER AND PANEL MEETING.

Two questions of importance were dealt with at the semi-annual meeting of the National Veneer and Panel Manufacturers' Association, held recently in Chicago. One was the question of freight rates. When the Interstate Commerce Commission started to investigate the rates and classifications of lumber and veneers in 1916 the case of the veneer and panel industries was handled by D. E. Kline of the above association. He presented his arguments and other information in such a clear, unanswerable manner that everything asked for was granted. Before the finding of the commission was put into effect the railroads were taken over by the Government and the matter has been permitted to stand in abeyance since that time.

Under the ruling made by the commission, the rate on veneers were to be the same as on lumber, with fancy face stock 15 per cent. higher. Plain panels were to be rated at 10 per cent. above lumber rates, and fancy panels 15 per cent. above. Were these rates to be put into effect at the present time it would result in a considerable saving in freights on veneers and panels.

The other matter of vital interest to the industry which was discussed at this meeting was the question of publicity. The Plywood Trade Extension Bureau was authorized to spend $50,000 in an effort to broaden the field for veneers and plywood products, and to combat prejudice held by the general public against veneers and veneered products. G. O. Worland of the Evansville Veneer Co. is chairman of the Trade Extension Committee, which is behind the publicity campaign.

It was decided that there would be no necessity of changing the name of veneers. This decision was based upon the wealth of information uncovered by the Research Committee. It was found that veneers had been used with success for centuries. By digging into such ancient chronicles as Pliny, the historian of Rome, and others, photographs were presented, showing the veneering process as far back as the early Egyptian dynasties. It was also brought out that the master furniture craftsmen of both modern and ancient times found veneer the best medium with which to enhance the beauty and value of their product. It was felt that an extended publicity campaign would not only create new and greater business, but would raise the veneer industry to a more dignified plane.

J. F. Hirt of the Forest Products Engineering Co., Chicago, delivered an interesting address on "Controlling Moisture in Lumber and Veneers." Part of this talk appears elsewhere in this issue.

Another step of far-reaching importance was the decision made to work out and put into force a uniform set of grading rules, which might be termed "national rules," for the inspection of veneers and plywood. This move calls for a national inspection bureau and the employment of a qualified inspector to settle disputes with regard to grades and rule interpretations.

From reports presented by those present, it would appear as if a large percentage of the veneer mills have ceased manufacturing and that many of those operating are endeavoring to clear up what stock they have on hand before closing down. Woods operations have practically ceased and from the point of production the industry is at a very low ebb. It is not likely that manufacturing will be resumed before fall and not then unless there is a marked improvement in demand

Chemical Reaction Affects Casein Glue

Although casein glues are highly water-resistant, they ultimately decompose when exposed to a damp atmosphere for a long time. For many months studies have been under way at the Forest Products Laboratory to discover the cause of this decomposition.

The decomposition study is still far from complete, but the conclusion has been reached that the decomposition of ordinary alkaline casein glues is not due to the action of bacteria or molds. It appears to be due entirely to chemical action of the alkali in the glue. This conclusion is based upon the following observations:

Increasing the amount of alkali in the glue increases the rate of decomposition when the glue is kept wet.

Glues containing no sodium hydroxide, although deficient in some important respects, do not decompose as rapidly as similar glues containing sodium hydroxide.

Cultures of molds and bacteria could not be obtained from decomposed alkaline glues.

Some chemicals which have antiseptic properties are found to improve casein glue, but this improvement is due to their chemical action rather than to their toxic properties.

Glues can be completely decomposed in a short time at temperatures above that at which bacteria can grow.

Further work is being directed toward the production of glues which will resist chemical decomposition and at the same time be impervious to the action of fungi and bacteria as well as moisture.

Cheaper Panel Construction

It has been suggested that the use of plywood cores made from heavy rotary stock instead of the ordinary solid core, will reduce the cost of solid panels, ¾ in. and over, and at the same time result in a better product. The idea is that a core constructed of layers of heavy rotary-cut stock, would not cost as much as the lumber required for the solid core, and that a panel made with a laminated core, would give better service, would not have such a marked tendency to warp and buckle, and would stand rougher usage.

The idea is, certainly worthy of consideration. It would require numerous experiments and a careful check on operating time to determine the comparative costs of these two cores. If it should be found that the built-up core can be made for less money than the plywood one, it is, certainly, a step in advance, for there is not any doubt that a panel built entirely of laminated material is superior to one having a solid core.

Should this idea prove practical, it would result in lowering furniture costs, for this laminated construction can be used for bureau and table tops and other places where heavy veneered stock is required.

A good spindle guard not only reduces the chances of a workman cutting his fingers, it helps him to do jobs with a surety that, if anything happens, his fingers will be safe.

It pays to have a set of spanners for each machine Good spanners which fit the nuts should be kept in a cupboard or hanging up on the wall.

VENEERS

The Quality Kind

We carry in stock, for immediate shipment, 3 and 5 ply Panels in Birch, Oak, and Mahogany — sizes 24" and 30" wide, 48", 60" and 72" long.

A complete range of American Walnut, Quartered Oak, Mahogany, Figured Gum Veneers and Rotary Cut Veneers.

It is not uncommon that a really fine piece of furniture has been practically ruined after a few months service because of the poor grade of veneer used. Such happenings do much to harm the manufacturer's reputation. That is why many will not consider anything but the best—usually they insist on Toronto Veneers—the quality kind.

VETERAN WOODWORKER CELEBRATES GOLDEN WEDDING.

Mr. and Mrs. George Gall, 6 Jameson Avenue, Toronto, celebrated their golden wedding on July 15th The venerable couple are still in good health and were the recipients of numerous gifts on the happy occasion.

Mr. Gall is one of the veteran lumbermen of Canada, being now 82 years of age. He still comes down to business and is quite robust. He was married on July 15th, 1871, to Miss Maria Mark at Strichen, Aberdeenshire, and shortly after came to America with his bride, locating in New York for a couple of years and then removing to Toronto.

Previous to his marriage Mr. Gall, who was a carpenter and contractor, had spent some time in New Brunswick, Boston and New York. On returning to this country he formed the McCracken-Gall Lumber

George Gall, Toronto

Co., who took over the business then conducted by John Oliver at the corner of Soho and Phoebe Streets, Toronto. At that time they did a general contracting trade, as well as operating a busy planing mill and woodworking plant, and built a number of cars for the Toronto Street Railway in its early days.

Mr. McCracken passed away and Mr. Gall sold out in 1889. He then formed the Gall-Anderson Lumber Co., his partner being John O. Anderson, now an honored official with the Ontario Government. They established a woodworking factory on Niagara Street where the National Casket Co. is now located, and their lumber yard was on Tecumseth Street, where the present City Stock Yards stand. This partnership was continued until 1898.

Mr. Gall erected a large number of houses in the city and conducted a large contracting business in addition to running a lumber yard. After going out of this line he went into the wholesale lumber business exclusively, forming, some 23 years ago, the Gall Lumber Co. Limited, which had offices in the Confederation Life Building. Two years later one of his sons, Alfred J. Gall, joined him, and in 1905 another son, W. C. Gall, became associated with the firm. The yards of the company were then located at the foot of Bathurst Stret. In 1908 the office was removed from the Confederation Life Building to the foot of Spadina Avenue, where storage sheds and large dry kilns were erected, and the yard transferred to the same site.

During the past few years the Gall Lumber Co have specialized in native and imported hardwoods, and have built up a well established business throughout the Province of Ontario.

Mr. and Mrs. Gall have a family of three sons and five daughters, all of whom, along with several grandchildren, were present at the golden wedding celebration. The sons are W. C. Gall and A. J. Gall of the Gall Lumber Co., and Hugh Gall of Robertson Bros., Limited, Toronto. Many friends will wish the venerable couple many more years of peaceful and contented wedded life.

THE POPULARITY OF CEDAR CHESTS.

When the manufacture of cedar chests became so great that you found a cedar chest in every furniture and upholstery stock in the country other manufacturers began thinking along similar lines and as a result we had old oak chests to go into rooms calling for old oak furniture and mahogany chests for rooms of mahogany—treasure chests trousseau chests linen chests and all of them entering into great competition with the cedar chest. But, somehow or other, they didn't seem to interfere with the sale of cedar chests. We are told by one manufacturer that last year the sale of cedar chests throughout the country ran close to $10,000,000.

The cedar chest has had always one appeal as a moth-repellent which has kept it popular, and it is perhaps for this reason, more than anything else, that sales have become so great, notwithstanding competition with other woods.

New Style French Furniture

A recent despatch from Paris says that a new style in furniture was demanded by representatives of the French furniture industry at the Furniture Congress held recently in the Parisian capital. Architects are blamed by the president of the Furniture Makers' Association for the continued production of false Louis XV., Louis XVI. and other styles of antiques. They design interiors to go with such furniture and naturally the manufacturers have to meet the demand, he says. The president proposed that the teachers in the fine arts school should begin the campaign for a modern original style by inspiring original ideas under the general direction of a committee composed of artists, architects and furniture makers. He hopes this method will produce an entirely new style that will mark this epoch as did the styles of the two Louis, of the Empire and the Renaissance.

THE NEW MAN.

Figures show that the new man on the job is very likely to be hurt. Why not make a practice of showing him any danger spots there may be? Show him the safe way to do his work. If he is also new to any industrial work, take a special interest in him—a word of advice may save him from serious injury. Don't leave him to learn in the bitter school of experience.

It will certainly pay you to try high-speed steel cutters for long runs of mouldings. Be sure that your workmen do not spoil these cutters by overheating them in the grinding.

REVIEW OF COOPERAGE SITUATION.

Some idea of what 1,250,000 feet of logs look like may be gathered from the accompanying illustration. This was taken at the plant of the Trenton Cooperage Co., Limited, Trenton, Ont., and shows some of the logs which are awaiting manufacture. This huge quantity of raw material is unloaded on twenty-seven skidways.

1,250,000 feet of logs on skidways at Trenton, Ont.

The railroad siding, indicated by the loaded cars, is so situated that the logs may be rolled off on either side.

W. A. Fraser, manager of the above concern, in reviewing the situation with regard to the Canadian cooperage industry, says: "While up to the present we have managed to maintain a volume of business equal to, or, in fact, somewhat ahead of the same period for 1920, generally speaking, the situation has not been at all satisfactory to cooperage stock manufacturers. During the past six or eight months the selling price of the different lines of slack cooperage has been cut in two; which, of course, will result in heavy losses, as manufacturers purchased and took out their raw material at the highest cost known in the business. In addition to the cost of stumpage, labor, provisions and horse feed, we have been transporting our timber under freight rates that are 100 per cent. higher than they were in 1914 and 40 per cent. over the rates in effect during the same period of 1920. This all, of course, has added to the cost of production, the only offsetting reduction being 10 per cent. decrease in manufacturing wages since May 1st, 1921.

"The general business conditions in Canada and United States have probably affected the cooperage industry more than any other line. American cooperage manufacturers are to-day offering their manufactured material at less than the actual cost of the logs. As there is a very small tariff protection, cheap U. S. stock has had a demoralizing effect on the Canadian market, for the millmen across the border seem to be willing to part with their product at practically any figure in order to get ready money.

"We have been operating our Trenton plant to full capacity since April first and will cut over four million feet of timber into cooperage stock this season. To effect the heavy rail freights, we have handled a considerable portion of our cut by water this year, and have found cribbing and towing hardwood logs to work out very successfully. We use a gasoline tow boat, which has proved much more economical than steam.

"We installed an 8 in. gum shot feet in our Trenton plant during the spring of this year and find that it has considerably increased our capacity for preparing both our stave and hoop material, but apart from this and additions to our facilities for handling raw material, we have not made any extensive improvements.

"While prospects in the Canadian cooperage trade depend almost entirely on the resumption of general business in the United States, there is a strong feeling among the manufacturers that there will be marked tween now and the 1st of September, as there has really improvements in the market for cooperage stock bebeen no over-production, but simply a lack of buying."

NEWLY ORGANIZED WOODWORKING COMPANY

The Buyers Door & Manufacturing Co., Limited, is the name of the company which has taken over the business formerly known as Batts, Limited. This new development means a change in name rather than a change in management. It is some three years since Messrs. Batt severed their connection with the concern which bears their name. John S. Bond, who has been manager for the past few years, will continue in charge, and will, as heretofore, be assisted by his brother, Thomas G. Bond, as superintendent.

John S. Bond, the vice-president and managing director of the new organization, comes of a family which has been associated with the woodworking and lumbering industries for three generations. He has been actively engaged in this field for twenty-five years, while his brother has had fifteen years' practical experience.

The lines manufactured include veneered and pine doors, columns, newels, frames, sash, flooring, panel-

John S. Bond, Toronto, Ont.

ing, interior fittings, together with general and special woodwork of all kinds. The trade mark "B. L.," which is so well known to the trade, is being retained.

To young men. Don't watch the clock. Work so you can win a good position in the world. You have plenty of leisure for football and pleasure. Keep them outside the mill.

Too much gullet is as bad as too little. It weakens the saw and allows the set to come off the teeth.

A train bearing samples of products made in France will tour Canada during the latter part of August. The purpose of this tour is, of course, to acquaint the public with the quality and scope of French manufactures suitable for sale and consumption in the Dominion.

The Valley City Seating Co. of Dundas recently shipped a large order of church furniture to Hendrina, Transvaal, South Africa. The order, which is the second one the company has shipped to South Africa, included pews and other church accessories.

W. A. Coward, who is conducting a general woodworking business at Hespeler, Ont., is doing hand lathe work at the present time. He intends in the near future to make handles for forks, shovels, etc., and when fully established will specialize in edged tool handles.

The Gove Motor Car Co. of Detroit, Mich., who contemplate establishing an automobile factory in Canada, have purchased a site at Thorold, Ont., and will shortly commence the erection of their plant. A by-law has been carried granting a fixed assessment for a period of years.

The members of the Ottawa Men's Piano Club, with their wives and families, held an enjoyable picnic recently at Riverside Park, Ottawa. Some twenty athletic events were run off for handsome prizes donated by the various music houses of the city. A. W. Brown is honorary president of the club.

Don McKee, Wallaceburg, Ont., expects to commence work on his new planing mill and sawmill in the near future. Most of the material and equipment have been purchased. Walter McLean and Alonzo Phillips are erecting a small woodworking and cabinet shop in connection with this plant. They propose installing a combination woodworker and a handle-making machine.

The planing mill of the East Kootenay Lumber Co., Jaffray, B. C., was recently destroyed by fire. The damage amounts to $50,000. In addition to the plant, about 300,000 feet of choice lumber went up in smoke. No decision has been reached as yet with regard to rebuilding, although it is likely that a new plant will be put up in the near future.

The Canadian Western Cooperage, Limited, has been organized with a capital of $150,000, to take over the various cooperage and barrel manufacturing plants in British Columbia. This company will practically control the entire barrel industry in the western province. The head office of the new company is in Victoria, and Leo Sweeney of Victoria is the general manager.

The quietness in the wooden shipbuilding situation which has existed for the past six months was broken recently by an announcement by Inspector H. A. Barrett that the Dominion Government had decided to take over the shipyard at Victoria, B.C., and the uncompleted ships of the Victoria Ship Owners, Limited, and complete the programme.

The Forest Products Engineering Co. of Chicago are installing a piece-rate system based on "earned hours" in the plant of the Stratford Chair Co., Limited, Stratford, Ont. This is the second contract the Forest Products Co. have had with the above firm. The work is being supervised by Wm. Snaith, their Canadian representative.

The Ontario Government contemplates appointing a commission to make a special study of industrial and commercial conditions in Ontario, with a view to evolving plans which should tend to improve present conditions. This body will probably include representatives of the boards of trade, prominent manufacturers and a number of farmers.

We are reliably informed that on July 6th, 1921, the District Court in the Grand Rapids District entered judgment for 20,000.00 against the firm of the Hood-Wright Co. for infringement of the Perkins' patents. The appeal, which had been previously taken from the decision in this case, has been abandoned and the judgment paid by Mr. Hood and Mr. Wright.

The second annual picnic of the Wholesale Lumber Dealers' Association, Inc., Toronto, which was to have been held about the middle of July on the grounds of the Lake Shore Country Club near Clarkson, has been postponed until the latter end of August, owing to the excessively hot weather.

The Joseph Creighton Woodworking Co., London, Ont., are manufacturing a line of interior woodwork for both residential and store and office buildings. They also specialize in store fronts and the woodwork for store windows. At the present time they are enlarging and rearranging their plant in order to take

Put an end to all the worries of a speculative pay-roll

Have Your Exact Labor Costs at Your Finger Tips

What a nerve-racking, uncertain job it is to pour over those old-fashioned, unintelligible and sometimes "much altered" time sheets when pay day approaches!

What a feeling of doubt you must have to realize that after you have it all compiled ***according to the figures of those out-of-date hand-written time sheets*** you are then not sure that you have received the actual number of hours that you have purchased and are entitled to!

PUT AN END TO IT NOW!

Your exact purchases of labor can be tabulated accurately and quickly from the sheets or cards of the International Time Recorder or Internatioual Job Time Recorder. Those records once the employee has made them are unchangeable, printed and positive and in such form that they are readily computed.

Would you take away your yard foreman's lumber stick? Of course not. Then why not give the same degree of accuracy to your labor costs?

International Speed Accuracy Economy Business Machines

International Business Machines Co.

LIMITED

F. E. MUTTON, Vice-President and General Manager

LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd WINNIPEG, 227 McDermott Ave. VANCOUVER, 110 Water St. SASKATOON, 254 Third Ave. S.

Also manufacturers of International Dayton Scales and International Electric Tabulators

care of the large volume of business offering. A few new machines are being added.

John T. O'Mara, with whom were associated several other Niagara Falls men, have purchased the Teal planing mill, Bridgeburg, and intend equipping it with the latest type of machinery. Six acres of land, adjacent to the mill, have been purchased. The new company, which has been formed, is planning to move a large stock of lumber to Bridgeburg, and will make portable buildings. The concern is capitalized at $40,000.

Fire recently destroyed the planing mill and lumber yard of Robert Stewart, Limited, Guelph. The blaze, which originated in the mill, was a fierce one, and in half an hour the structure was completely destroyed. Even the thick stone fire walls failed to stop the progress of the flames. Several other premises were destroyed before the blaze was subdued. The entire loss in the business district is estimated at half a million dollars, fortunately covered by insurance.

John Negrescon of Chicago, the inventor and patentee of the Klymax Washing Machine, was in Owen Sound recently on business connected with the Slade Mfg. Co., who make the Klymax in Canada. Mr Negrescon is president of the Home Utility Co., the American concern manufacturing the machine. Certain improvements have been made in the Canadian machine. The Slade Mfg. Co. is now well equipped to push the production of the machine.

The firm of Smith & Welch, lumber dealers, 2219 Yonge Street, Toronto, has been changed to Welsh Bros., W. R. Smith retiring owing to ill-health. Ivan Welsh has taken his brother, W. F. Welsh, who has been in the carpentering and contracting line for a number of years, into partnership, and the business is now being conducted under the style of Welsh Bros A planing mill is operated in connection with their yard.

A number of Stratford furniture manufacturers plan on leaving shortly for a business trip through Quebec and the Maritime Provinces. Those who contemplate taking this trip are H. W. Strudley, Imperial Rattan Co., Limited; L. J. Salter, McLagan Furniture Co., Limited; W. J. Anderson, Stratford Chair Co., Limited; F. W. Trebell, Kindle Bed Co., Limited; Chas. Farquharson, Farquharson-Gifford Co., Limited, and Chas. A. Moore of the Stratford Furniture Mfg. Co., Limited.

The Piano Cases & Phonographs, Limited, Brantford, Ont., have been specializing in the production of high-grade piano cases, K.D. and in the white. By specializing and adopting modern methods and equipment, they have been able to bring the manufacture of piano cases to a high state of perfection. Some of the manufacturers of pianos find it preferable to buy their cases ready for assembling and devote their entire attention to assembling, finishing and the other operations necessary to produce the completed product.

The employees of the Foster-Armstrong Piano Co., Kitchener, Ont., held a successful picnic recently at Waterloo Park. A number of interesting prizes were given in various sporting events. In recent months the firm has made rapid progress under the management of J. Ulman. Recently a shipment of pianos was made to New Zealand. The factory has been kept quite busy in spite of the quietness and general industrial conditions.

An application to wind up the business of the Mill Cut Homes & Lumber Co., Limited, Vancouver, B.C., was dismissed with costs recently by Justice Murphy of the B. C. court. The plant of this concern was destroyed by fire recently and the plaintiff desired to have the insurance money divided among the shareholders and the affairs of the company terminated. As the business was a legitimate one and the company was not bankrupt, his Lordship thought that the other shareholders were within their rights when they insisted that the business be carried on.

Robert Stewart, Limited, Guelph, Ont., whose planing mill and lumber yard was recently destroyed by fire, have completed arrangements for using part of the factory of the Bell Organ & Piano Co., probably the organ factory. The equipment of the plant of H. Cargill & Sons, Cargill, Ont., has been purchased and will be put in operation in the Bell plant as quickly as it can be moved and set up. The head office of Robert Stewart, Limited, will also bo located in the Bell building.

A meeting of the executive committee of the Furniture Manufacturers' Association was held recently in Toronto. Instead of holding this meeting in the board room of the association, as usual, they adjourned to the Royal Canadian Yacht Club, Centre Island, where they had lunch and spent the afternoon discussing the affairs of the association. Twelve members were in attendance. This new departure worked out very satisfactorily. Owing to the fact that they were away from the phone and other distractions, they were able to get down to business in quick order and devote their full attention to the matters in hand.

A provincial charter has been granted to the Long Lumber Co., Limited, of Hamilton, to carry on the business of lumber merchants, sawmill, shingle mill, planing mill and pulp mill owners, and to manufacture and deal in logs, lumber, timber, shingles, etc. Among the incorporators of the company are Guy Hathaway Long and Frank Robert Burton of Hamilton. The new company, which has been formed for the purpose of taking over as a going concern the business it has been successfully conducting for a number of years under the name of "The Long Lumber Co., Limited," has an authorized capital stock of $400,000, divided into 4,000 shares of $100.00 each.

The visiting furniture manufacturers, travellers and retailers, who attended the representative displays made at Kitchener, were recently entertained at the home of E. O. Weber. A splendid repast was provided. One of the features of the evening was a trial of strength between one horse and 35 men in a tug-of-war. In the first round human might prevailed, but in the second Dobbin took on a new lease of life and pulled his army of competitors all around the lot. There were two baseball matches. In the first fixture the travellers defeated the manufacturers by a score of three to one. Elated with their success, they undertook to trim a team of all-stars, and, much to their surprise, accomplished it. On the following night a supper and sports programme was held in Waterloo Park, Kitchener, which was followed by an enjoyable dance.

W. W. Wylie, one of the pioneer street car makers in Canada, died recently in Ottawa. For over twenty years he was general manager of the Ottawa Car Mfg. Co., and about eight years ago retired. He built the first sweeper ever used by the Ottawa Electric Railway, and was the first citizen in the Capital City to own an automobile. This was away back in 1894. Mr. Wylie was a practical and successful woodworker and builder

One Reason why Kraetzer Cured Gum is Straight and Flat.

Kraetzer-Cured Gum

THE ONLY KIND THAT IS ALWAYS BRIGHT, STRAIGHT AND FLAT

Kraetzer-Cured Gum does not "work" after being made up into furniture. It does not warp or open at the joints, or check in panels in the way that other less scientifically handled lumber does.

If you have used Kraetzer-Cured Gum, you know this already. If not, you owe it to yourself to find out about this super hardwood.

This "quality product" does not happen by chance. One reason is that Kraetzer-Cured Gum is steamed in the Kraetzer Preparator. Then every board is carefully graded, the sticking is scientifically and perfectly done, every stack is side ventilated, is elevated, and every pile is on wheels. Then, to begin with, remember that Kraetzer-Cured lumber is made from large virgin timber of exceptional quality.

Besides Gum, we have Oak, Ash, Tupelo, and Cypress of a quality that is unsurpassed.

Write us today for the reasons why Kraetzer-Cured lumber is *different* and *better*. We guarantee every board.

and contributed to a large degree in bringing electrically-operated street car transit up to its present high state of efficiency. He was for some years in partnership with Richard Shore in Ottawa, and carried on an extensive carriage and waggon-building business before becoming associated with the Ottawa Car Co. The street cars turned out at this plant are known practically al over the Dominion, the firm being one of the biggest electric car manufacturing concerns on the continent.

LUMBER SITUATION GETTING SERIOUS.

J. N. Woolett, president of the Aberdeen Lumber Co., Chicago, Ill., recently returned from a three weeks' trip through Arkansas, Louisiana and Mississippi. The object of this trip was to gain first-hand knowledge of the situation which exists in the various lumbering centres. As a result Mr. Woolett wonders what the furniture manufacturers and other users of high-grade hardwoods are going to do for their stock for the coming year.

In outlining the impressions gained, he says a most casual glance at the various stock lists by the Southwestern lumber manufacturers discloses a startling scarcity of high-grade lumber. A personal trip through this territory strengthens the conviction that there is practically no firsts and seconds unsold on the market.

The stagnation of the past six months at the manufacturing end still continues, as practically all the mills have disbanded their organizations and are not operating. In my judgment there are two outstanding reasons why even after conditions improve there will be a marked absence in the resumption of manufacture: First, because the lumber cannot be put in pile at its present high cost of production and sold at a profit on the basis of to-day's price; second, a large number of the manufacturers are in bad shape financially, as their losses due to the spectacular drop in prices are very heavy, and the value of the low-grade lumber still in their yards is so low than even if shipped it would produce but little in real money, not sufficient to properly finance the production of new lumber. Practically every small mill producer is out of business, and only occasionally here and there is a mill actually manufacturing, and then only such logs as must be cut up to prevent their complete loss.

With considerably less than normal unsold stocks available and practically no firsts and seconds, it would appear to be an unusually fine time for the consumer to put in his yard such stock as he may need for fall manufacture, for undoubtedly many attractive bargains can now be secured, especially on No. 1 common grades.

For the producer of lumber we would welcome the return to the market of the consuming buyer at this time rather than to have them all wait until later in the year when the tendency would be for them to come into the market at the same time, thus causing an unhealthy condition. If there is a fair volume of business during the next ninety days, it would hold prices to a reasonable level and would justify the manufacturer where possible to resume his operation, thus keeping the available stocks at the mills in reasonable proportion to the demand which will appear during the next six or eight months.

No time like the present to mend that fastener in the half-broken belt.

Saskatchewan Carbonizing Coal Ovens

In 1914 the Saskatchewan Government published a report upon certain experiments in the carbonizing and briquetting of lignite coal, which they caused to be undertaken in the Estevan district. These experiments were in charge of Mr. S. M. Darling, and a very comprehensive report was published at the conclusion of the experiments.

Applications for copies of this report have been received by the government from distant parts of the world, even from Japan, and acknowledgement of the reports indicate a lively interest in the particular method of carbonizing followed by the government of Saskatchewan in these experiments.

It is reported that a company in Arizona has put into operation one of the Saskatchewan types of graduated carbonizing ovens, and that the oven worked splendidly, and so impressed were the officers and directors of the company who had examined the workings, that at the conclusion of their examination they gave instructions to quadruple the plant.

Is Lumber Good Buy at Present Time?

Report of Personal Investigation by W. B. Granger — Indications Point to Shartage of Certain Stocks — Buying Appears to be Slowly Increasing

The Editor of "Associated Furniture," a paper published in the interests of the various American furuiture manufacturers' associations, recently completed a thorough investigation of the lumber situation. A few paragraphs from his report are reproduced here. It must be understood that this investigation was carried out from the viewpoint of, and in the interests of, the furniture manufacturer; therefore, it should not be considered to contain just what the lumbermen would like to have published. The demand for lumber has shown a slight improvement and the prices of a few items which are becoming scarce have advanced from $5 to $10 per thousand. This is an indication that a shortage is developing in certain lines, rather than a sign that buying is becoming general. Were the latter to be true, prices would jump almost immediately. The suggestion that the opportune time to buy is now is a good one.—The Editor.

At the outset of this article the author desires to call particular attention to the fact that the information contained is the result of a personal interview with the executive heads of practically all of the largest lumber manufacturers in the Memphis, Louisville and Chicago markets, and while there may be some furniture manufacturers who may accuse me of letting the "enemy" fill me full of "hot air," I believe the general firming up of quotations during the past three weeks should convince even the most skeptical that the data here given represents facts—not fiction.

Perhaps one of the things that has contributed to the false impressions that exists with regard to the actual lumber situation has been the fact that so many lumber manufacturers themselves flooded the market with stock sheets in their efforts to secure even a little business at a time when business was hard to get but the fact remains that regardless of these deluges of stock sheets, there is not at the present time anywhere near a normal stock of the grades and thicknesses of oak and gum (in particular) on hand, and furthermore, with conditions in the lumber industry as they are today, there will be no new stocks of any consequence available prior to January 1st, 1922.

In the first place it is a recognized fact that 60 per cent. of the hardwood lumber produced is manufactured by approximately twelve hundred commercial sawmills, while the other 40 per cent. comes from little plantation owners, and other small manufacturers, who number about five thousand. It is these latter producers who under normal conditions manufacture the surplus of lumber which really governs the market.

These small producers have done no logging since October of 1919, and their stocks have long since been absorbed and are out of the market. The reason for this has been that the winter of 1919-1920 was one of the worst that lumber manufacturers have experienced in a long time and logging operations were absolutely impossible, except for a few manufacturers who are in a position to cut timber under almost any conditions.

It is, of course, true that the production of these small operators does not ordinarily reach the furniture manufacturer for the reason that their stocks run so unevenly that they will not cut to advantage in our factories. There are, however, many places where they can be used and the elimination of the production of these stocks is therefore a serious matter, because it will bring many buyers, who ordinarily do not purchase from large operators, into the market at sources that supply our requirements.

A thorough investigation of operating conditions in the lumber industry to-day would place present production at less than 15 per cent. of normal. In fact, the author has found only three concerns who are logging at the present time. Quite a few manufacturers had fair supplies of logs on hand at the time logging operations were stopped, but with few exceptions these concerns have already cut up what stocks they had on hand and have now closed their plants down tight and are simply taking the position that they will not even consider resuming operations until the market gets back to a point of where they can sell their products at a price that will enable them to make a profit.

In the south there has been 25 inches of rain during the last six weeks, and this means that even if the operators so desired, it would be impossible for them to get into the timber short of July 1st. When it is further considered that the forces of these operators have been disorganized and that it would take from sixty to ninety days to put their organizations back into any kind of shape, it would be conceded that logging operations cannot be looked for before the middle of July at the very earliest.

The fact of the matter is that it will be very surprising if logging operations are under way prior to September 1st, but even though they were, it must be conceded that there would not be any dry stock suitable for furniture manufacture available for at least four months after the logs are put on sticks

One of the biggest factors affecting the situation at the present time is the fact that owing to the extremely high price on lumber and the strong demand in the early part of 1920 the operators had begun to pick up very low grade logs and the percentage of F A S and No. 1 common produced during the past year was therefore far below normal.

The fact of the matter is that a canvas of the stocks on hand at mill points among Memphis operators shows stocks of F A S oak and gum running only 8 per cent. of total footage on hand whereas, under normal conditions they should run from 16 to 18 per cent.

Were it not for the fact that the flooring mills had picked up so much inch common oak the situation on that item would not be quite so serious, but when it is realized that a normal stock is only about 25 million feet, it can be readily seen why prices have already advanced from $7.00 to $10.00 per thousand.

On red gum, the same situation prevails on F A S; in fact, the author saw one operator call up 14 different concerns in an effort to find a car of 4/4 plain, without success.

Sap gum doesn't seem to be so bad, except F A S stocks are considerably below normal, but taking all items as a whole the conclusion can only be reached that with each succeeding sale the price of lumber will firm up a little more.

Many operators are to-day quoting as high as $50 for common oak at the mill. If you don't want to pay that amount, the time to cover is now.

Better work follows the use of the "Empire"

There is no question about it. EMPIRE all steel clamps do the work with less chance of failure than any other you can purchase. In scores of shops where they are in daily use results bear out the truth of this statement. If you will try them once you will be convinced.

Get in touch with us now. We can make prompt delivery from stock.

We specialize in all types of woodworking tools.

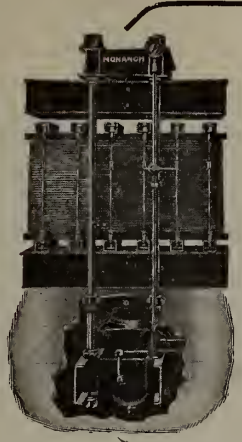
Farquhar Hydraulic Machinery



Monarch Veneer Presses

Farquhar Hydraulic Veneer Presses have double steel head and base, and heavy steel strain rods. Cylinder, which is of steel with detachable saddle, can be repacked without removing the ram. Pump is quick acting, of rigid construction. A pressure of 100-lbs. to the square inch is applied to the veneering surface. Stock is handled by retainer system, unsurpassed both for efficiency and economy.

These presses are built to suit all requirements, liberal proportions with first quality material and workmanship throughout.

We make a specialty of Pumps, Accumulators, Etc. Also all kinds of special Hydraulic Presses and equipment to order. Write us concerning your requirements.

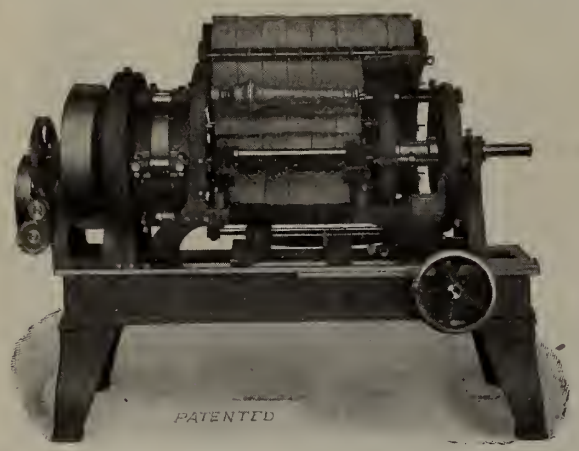
ARE YOU FULLY EQUIPPED



To manufacture furniture and fill orders when they come?

The NASH SANDER for furniture turnings, has proved its worth to many a furniture manufacturer in his time of need.

Can you afford to overlook anything which can put you in better condition to take care of the big business coming?

J. M. NASH, Milwaukee, Wis.

Cary's SUPERIOR QUALITY Corrugated Fasteners

SAW EDGE

PLAIN EDGE

According to final decision, after long litigation, we have been granted the SOLE RIGHT to manufacture a Saw Tooth Corrugated Fastener with a continuous cutting edge. Our fastener is beveled evenly on both sides, which enables fasteners to be driven in straight, and much easier than any other fastener made. Our Corrugated Fastener is made in various widths and corrugations, also in coils wound right and left. Try our products and you will use no other.

Samples and prices on request.

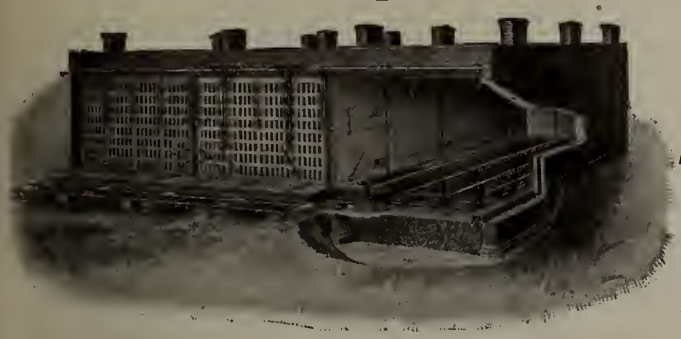
"Read Up" on the New Method



of Seasoning Lumber in Kilns instead of merely drying it.

Our New Literature Willingly Sent

THE STANDARD Dry Kiln Co.

1542 McCarty St. INDIANAPOLIS, IND.

"The Canada Lumberman" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free duscussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements. Sample copy and full information on request. Head Office, 349 Adelaide St. West, Toronto.

Automatic Hole-Cutting Machines

The Wheel and Hole Cutting Machine has four automatic movements, all of which work in perfect unison, performing their functions in clock-like regularity.

The Hand-Hole Machine will cut hand holes in crate and box ends. It is worked by a carriage and levers, and will cut any size or length hole with either round or bevel edge in any kind of wood.

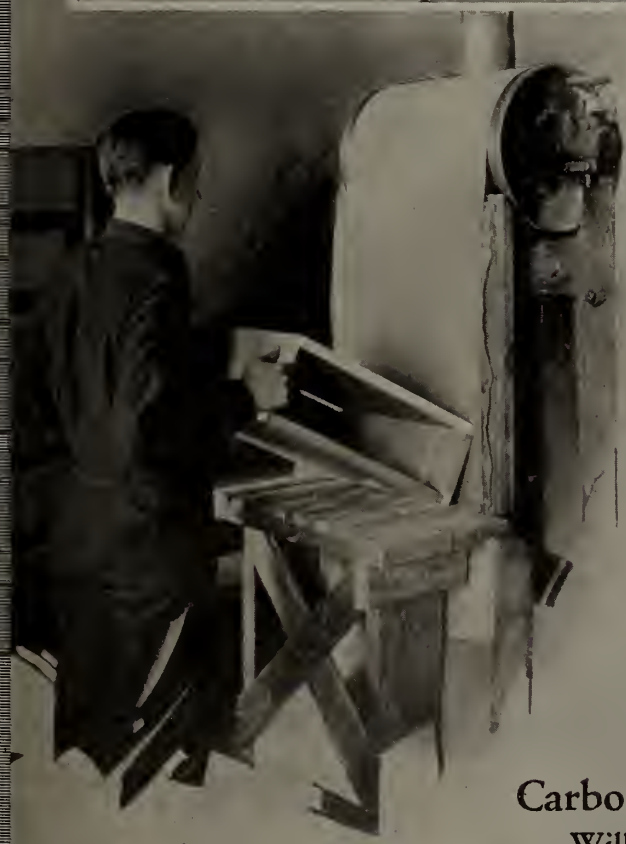
NATIONAL DRY KILNS

Speaking of the Flexibility of Carborundum Brand Garnet Products



ONE of the strongest talking points in favor of Carborundum Brand Garnet Paper and Cloth is flexibility.

Fexibility really means durability.

A flexible Garnet paper or cloth lasts longer. There is no cracking or peeling even when worked over angles or corners.

The grains get a better chance to cut more freely, therefore the product produces more.

Many years of knowing how, has built into Carborundum Brand Garnet Products that vital quality of flexibility.

It comes from painstaking effort, from a most improved method of manufacture.

Then, too, it must be remembered that every bit of paper and cloth is of the highest quality—that the Garnet grain we use is clean, pure, sharp and uniform—that the glue is of the highest grade.

Benefit from the World-Wide Experience of SKF Engineers

Are you faced with any of these problems

—Power wastage through friction in shafting or machinery

—Variations in product due to lack of precision or wear of bearings

—Difficulty in adjusting machines

—Slow speed due to limitations of bearings or slipping of belts

—Belt trouble at high speed.

Your problems have most likely been solved before, somewhere, by **SKF**—in England, Sweden, Switzerland, United States, China, Japan or Canada. If not, **SKF** engineers conduct a laboratory which can solve it, and **will,** gladly, without cost to you.

The advice and practical assistance of the Canadian **SKF** Engineers are entirely at the command of industrial concerns.

Consult us without incurring any obligation.

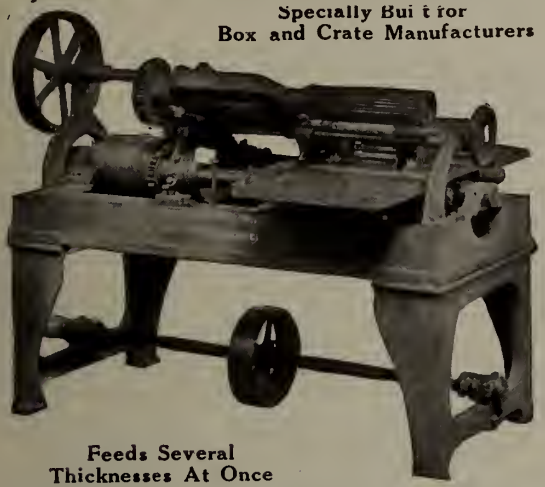
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

Chattanooga Machinery Company
Chattanooga, Tenn.

To **Woodworkers and Furniture Manufacturers**

Your requirements in Reed Forms for Wicker Work Furniture, Mechanic's Tool Cases, Dowels, Novelties, Cedar Chests, Piano Lamps, Table Lamps, etc., can be promptly supplied by us.

We are always pleased to quote prices and give any information you may desire. Try us on your next order.

THE
Brantford Pattern Works
BRANTFORD

Times Are Dull

And in order to clear our present stock we are prepared to accept any reasonable offer on the following machines. Write for full description, or call and inspect same.

1 Automatic Knob Machine, with quantity of cutters
1 Jig Saw, Goldie & McCulloch
1 Jig Saw, McGregor-Gourlay, wood top
1 American Double Disc, 36" Sander, adjustable tables
2 American Three-screw Veneer Presses, 38" wide
1 Gravity Swing Cut-off Saw, McGregor-Gourlay
1 12" Moulder, Cowan & Co., 4-sided
1 16" Buzz Planer, Clark-Demill
1 No. 5 Buffalo Blower
1 No. 3 Sturtevant Blower
1 Band Saw, 34", McGregor-Gourlay
1 High Speed Ball-bearing Shaper, Preston
1 Tennant Machine, McGregor-Gourlay
1 3-sided 7" Cowan & Co. Moulder
1 Chaser Grinder, Modern Tool Co.
1 Double Exhauster, 45", American Blower Company
1 C. M. C. No. 212 Double Surfacer Planer, 30"
1 Sash Sticker, H. W. Petrie
1 Dowelling Machine, M31, Cowan No. 2, cap. up to 2½"
1 S. A. Woods Matcher and Planer, 15" x 6"

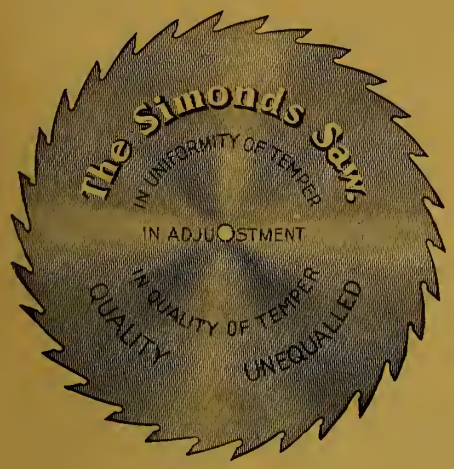
One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier

For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.



SIMONDS
SAWS and KNIVES

Are made right. Every operation from the making of the steel to the finishing and packing is watched by experienced workmen. The latest appliances known to the metal trades are used to insure the quality of SIMONDS Saws and Knives. After each operation they are inspected by experts for defects in quality and workmanship. The result—as good a saw as human skill and science can make. Prove it to your own satisfaction. Let us quote you on the tools you need.

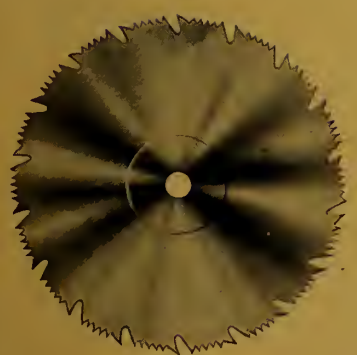
ATKINS

STERLING QUALITY

SAWS and KNIVES

mean continuous, efficient work and 100 per cent. production.

The extraordinary demand for more buildings and homes means that the Lumber output must increase.



Atkins Sterling Quality Saws and Knives will assist you in making the year 1921 the biggest and best in the history of your business.

Write to-day for our Knife Booklet "C W" and Pattern Template Paper.

E. C. ATKINS & CO.

Makers of Sterling Saws

Factory—HAMILTON, Ont. **Vancouver Branch—109 Powell Street**

"176" in factory of Western Furniture Company, Indianapolis, sanding inside curved edge of a circular cabinet panel against solid sanding roll. The curved frames on the trucks are similarly finished at a very considerable saving over other methods.

MATTISON

176

Oscillating Belt Sander

For Edge and Shaped Work

Successfully employs stationary forms

This shows a narrow-nosed form which provides an accurate and economical method for sanding the curved and flat members of both square and octagonal pieces. The sanding is done with the grain, and the stock is handled but once.

BECAUSE of its substantial construction, this sander is entirely free from vibration, making the use of special forms completely successful.

This feature provides a superior method for sanding the small, flat curves of ornamental square or octagon legs, pilasters, etc. The work is accomplished quickly, accurately and economically. Oscillation of the sandbelt improves quality by eliminating scratch marks.

Such a large variety of flat and curved edge work can be completely finished on this Oscillating Belt Sander, that no furniture factory can afford to do without it.

Send for Illustrated Bulletin Describing this Method in Detail

No Soldered Joints or Bolted Connections in

Canadian Crocker-Wheeler Rotors

The greatest improvement in modern induction motor design—no soldered joints to melt and cause arcing or open circuits and no bolted connections to work loose. The risk of fire as well as the possibility of motor troubles and consequent delay, is thus greatly reduced if not eliminated entirely.

The entire Rotor Winding of small squirrel-cage iuduction motors is cast of aluminum alloy—in one operation. Thus, the complete winding is one integral structure.

The medium and large size Rotors have liberal section copper bars and the end rings are cast-welded, making perfect contact.

The generous bearing sizes and sturdiness of mechanical construction throughout, further emphasizes the superiority of our motors for woodworking plants.

In Stock at our Branch Houses

OUR EXHIBITION

will be held at

163 DUFFERIN STREET

Our warehouse, situated just outside the main entrance to the Canadian National Exhibition grounds. You are cordially invited to call at our warehouse any time you will be interested.

A few of the machines arranged for inspection are the following:

1—McGregor-Gourlay Double Arbor Universal Saw Table, same as C.M.C. No. 618, with 14" saws, self-contained countershaft, full complement of gauges, saws, wrenches, etc.

1—Preston No. 127 Variety Saw Table, countershaft attached, one 14" saw.

1—Ballantine 36" Band Saw, with solid lower wheel, complete with saw blades, wrenches, etc.

1—Ballantine Two Spindle Shaper, Spindles 20½" centres, diameter of spindles where collars go on 1⅛", top 42" x 42".

1—American No. 1 Single Spindle Shaper. Fig. 937 with plain countershaft.

1—C. M. C. No. 507 Mortiser, with boring attachment.

1—C.M.C. No. 624 Hand Feed Rip Saw Machine, with self-contained counter shaft, table 6'6" long by 40" wide, with plain box gauge, 22" saw blades, 1¼" arbor with cone for receiving saws different diameter.

1—Ballantine 8" Four Sided Moulder, complete with square heads and straight knives on all heads.

1—American No. 2½ Single End Tenoner, with two copes and cut-off saw attachment. Fig. 9431 in American Woodworking Machinery Catalog.

1—C.M.C. No. 646 Roller Table Cut-off Saw, sliding table 7'6" long, stationary table 50" to the saw, sliding table equipped with stop gauge, including five stops, with countershaft, complete with saws, wrenches , etc.

1—Cowan Combination Vertical and Horizontal Boring Machine, complete with wrenches, etc.

1—Hespeler 12" Buzz Planer, fitted with round cylinder, full set of knives, countershaft, wrenches, guard, etc.

1—Preston 36" Band saw, lower web wheel and guards.

8—Sections Cowan Four Screw Veneer Press 12"x50", four sections 27" clear space under screw plates, four sections 32" under screw plates.

1—24" Francis Double Roll Glue Spreader.

4—Sections Cowan Three Screw Veneer Press 38"x12", 28" clear space under screw plates.

1—C.M.C. Arm Sander, No. 438, with paper cutter.

1—Universal Knife Grinder, 37", made by American Wood Working Machinery Co., Fig. 1126 in their catalogue.

1—60" Sturtevant Single Slow Speed Exhauster, left hand, top vertical discharge, complete with platform and rods to suspend from ceiling.

1—Cowan Chain Mortiser with grinder.

1—Ballantine 36" Band Saw, lower web wheel.

1—American No. 3 Double Cut-Off Saw, new machine, capacity from 8" to 6' 9" in length, 4" thick and 30" wide.

1—American No. 25 Edging and Ripping Saw, new machine.

1—American No. 30 Double Arbor Universal Saw Bench, new machine.

1—Preston 24" No. 121 Pony Planer, used only couple of months.

1—McGregor-Gourlay 24" Pony Planer.

1—Mershon Band Rip Saw.

SPECIALS

1—Morgan Two-Arm Shock Fastener, used machine, but in firstclass condition.
1—Used Morgan Eight-roll Box Board Matcher.
1—Used Morgan 12-spindle Double Row Chucks, Open Back Nailing Machine.

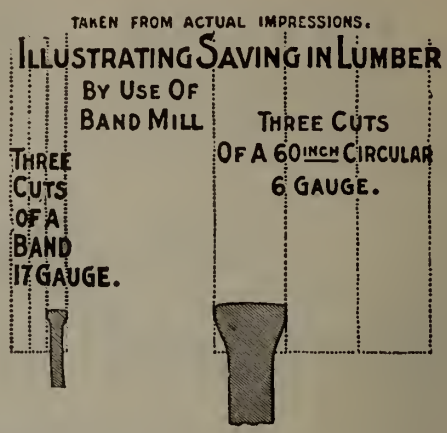
MORE LUMBER and LESS SAWDUST

That is the Aim of Every Millman



NO. 361 "LIGHTNING" BAND SAW MILL

Your sawdust pile is an absolute loss to you—a reduction of your sawdust pile is real money in your pocket.

Then why continue to use a wasteful circular mill, with its big sawdust pile, when a Fay & Egan Band Saw Mill will give you more lumber and less sawdust, as shown in the diagram above, made from actual impressions.

No. 361 will give you 20 to 25 per cent. more merchantable lumber from your logs.

Brings an average of 10 per cent. higher price than average mill cut. Band Sawn lumber is free from manufacturing defects, such as uneveness, roughness, "niggerheads," etc.

Write for our Band Mill Catalog.

Hamilton - Canada

C.M.C.

No. 619 Dimension Saw Table

Have you a large variety of work to do on a Saw Table? Here is a handy machine, fine for production work in ripping or cutting off, but also suitable for mitreing, bevelling or grooving.

It is an efficient saw which has proved its value in piano and furniture factories, planing mills, pattern shops and sash and door factories.

Built with that thoroughness and care which is making C.M.C. tools the most popular line on the market to-day.

Let us send you further details.

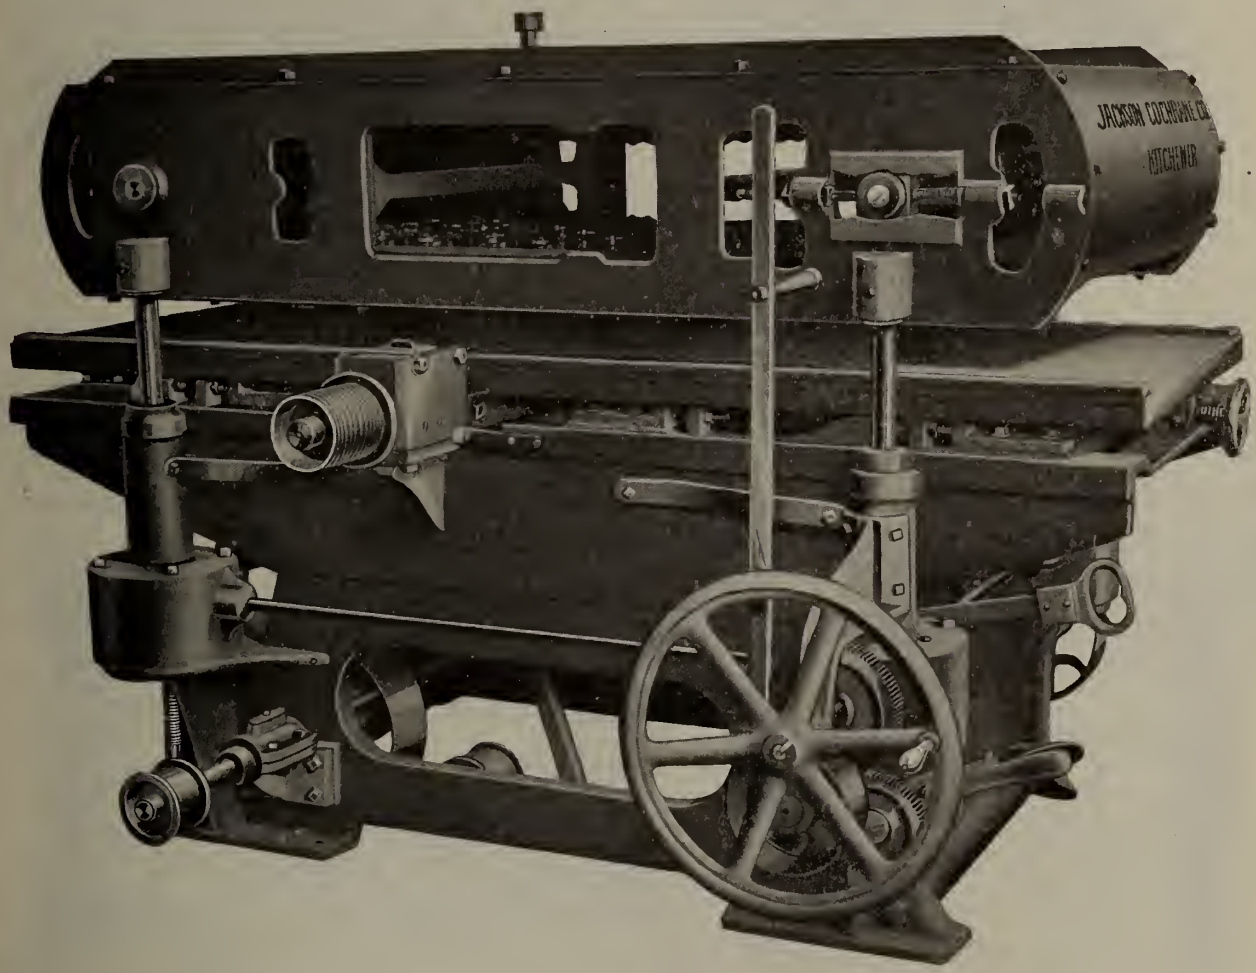
The

Herzog Self-Feed Jointer

means

Increased Production **Simplicity of Operation**
Small Floor Space **Safety to Employees**

Does four times the work of the Hand Jointer

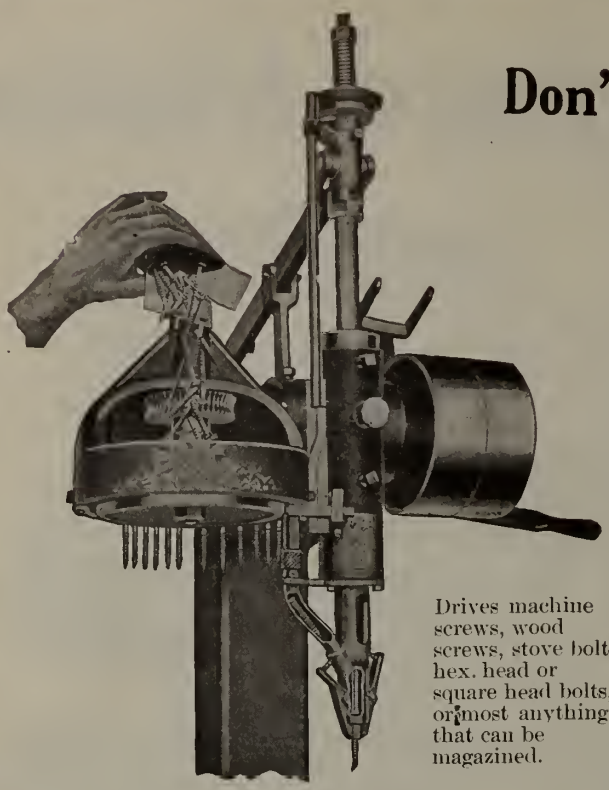


Our No. 34 Herzog Jointer, illustrated above, is one of the most efficient machines on the market to-day. It is appreciated by the manufacturer and employees alike, because, while it will produce from three to five times as much work as the hand jointer, it does not require skilled operators, but eliminates the danger so common to other makes. It can be operated by two boys. It will handle stock varying in width from 1 inch to the full width of the jointer, will feed fast or slow, takes only one-fourth the floor space of hand jointers, and requires only one-fifth of the sharpening of the knives. It is fitted with power feed raising and lowering attachment, with cylinder double belted and driven from both ends.

If interested in reducing your costs, write us

Jackson, Cochrane & Company

KITCHENER - CANADA



Drives machine screws, wood screws, stove bolts, hex. head or square head bolts, or most anything that can be magazined.

Don't waste time and money driving screws by hand

Follow the example of your competitors and install Magazine Fed Screw Driving Machines

The Reynolds Machine Co.
Department C.
Massillon, Ohio, U. S. A.

Robertson Patented Socket Head Wood Screws

Take the *high costs* out of Screw - driving

No matter whether you use automatic screw-driving machines or the hand method, you will find them far superior to work with.
Note the patented recess head as shown in the illustration. When the driver is set in it there is no chance of it slipping out and all burring is eliminated. The result is a clean, neat-appearing job that adds to the value of your product.

Many manufacturers are now using them exclusively and are all delighted with the results. **Drivers supplied free with first orders, and include** hand drivers, Yankee bits, brace bits or bits for the Reynolds machine, which gives exceptional efficiency when using recessed head screws. Send post card for free samples with bits whichwill prove our contention of double efficiency and savings in time, labor and annoyance, worth more to a large screw user than his entire outlay in buying screws.

At the Toronto Exhibition

be sure you see the

"WILLIAMS" EXHIBIT

IN MACHINERY HALL

Among other up-to-date equipment especially interesting to owners and superintendents of woodworking plants, you will see the new style

C. M. C. RIPPING and JOINTING SAW (No. 613)

This machine has been especially designed to accommodate those who have a quantity of light ripping, but not sufficient to justify the use of the heavier machine—No. 611. While somewhat lighter in construction than No. 611, and having a smaller feed range, the new machine is practically identical with it. You will see also the new

C. M. C. SELF FEED RIP SAW (No. 605)

which is a radical departure in design and embodies many features not found on any other self feed Rip Saw on the market.

Many Other Interesting Features in this big Machinery Exhibit

Here you will see the most up-to-date machinery and equipment for the machine shop, foundry and woodworking factory. Many of the machines will be in constant operation, thus giving you an excellent opportunity to judge of their efficiency.

Don't forget—Toronto Exhibition - August 27 - September 10—and go straight to the Main Entrance of **Machinery Hall** where the "Williams" Machinery Exhibit is—a feature that you will find both instructive and enjoyable.

Will It Spin?

? Not This One !

If that wheel should spin—even a little bit—at the end of each board passing under it, how accurate would you consider the record of footage?

The Productimeter

On **this** Lumber Meter the wheel **can't** spin—hence the record can be counted on **absolutely.**

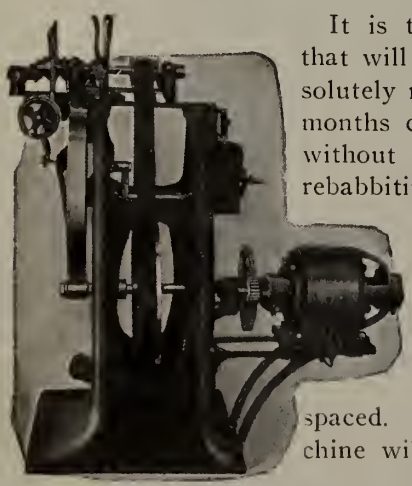
Let us send you one on 30 days' trial.
It will earn its cost by the saving it makes.

Durant Manufacturing Co.
615 Buffum St. Milwaukee, Wis.

The Berry Combination Band and Circular Automatic Saw Sharpener

Belt or Motor Driven. Capacity: Bands, 3-16" to 4", Circulars 4" to 32". Simple, Universal, Automatic in Action.

It is the only *combination* grinder that is *automatic*



It is the only grinder that will grind a saw absolutely round after three months continuous use—without readjustment or rebabbiting. It will take an unevenly spaced, hand-filed saw and make it perfectly round and even spaced. No other machine will do this.

For All Shops Using Circular or Band Saws

The Berry Tooth is far superior to the ordinary peg tooth. All teeth are alike, evenly spaced—ground right from the center. A saw ground with this machine does twice the work in half the time.

Write for Booklet to-day.

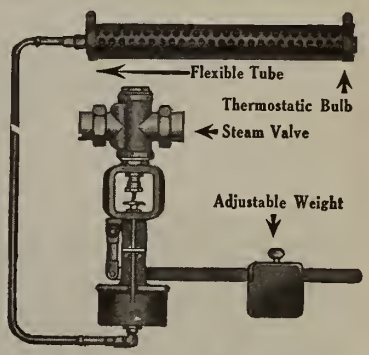
Correct Kiln Control

By installing an automatic heat regulator, you relieve yourself of the danger and worry of damaged material. Get real heat control—now—by installing



The Powers Regulator
No. 15
For control of Air Temperatures in Kilns, Ovens, Drying Rooms, etc. Entirely self-contained, requiring no air or water pressure for operation.

The Powers Heat Regulator

Built on a scientific basis—it is especially designed to control temperature in drying rooms, ovens, kilns, etc. Entirely self-contained, automatic, accurate and reliable.

During more than thirty years of practical investigation and study of temperature control we have gathered a fund of information which can be applied with profit in your plant. Powers Heat Regulators will give you profitable control over conditions which you are now leaving to the judgment of more or less intelligent "help." A Powers Heat Regulator will eliminate the guesswork and the risk in those processes where heat is a factor. We manufacture a type of regulator for practically every industrial process.

State your heat problem to us and we will show you how to save money, increase profits and improve results.

The Handiest Machine on the Market

The Split-tilting table (Patent Applied For) can be tilted and locked at any angle up to forty-five degrees as indicated on the graduated segment. This machine is also supplied with a solid table. The Boring Attachment is very complete in itself. A foot lever is connected with the table which slides back and forth on the knee. A large coil spring located in the column of the machine automatically releases the work from the bit when pressure is removed from the foot lever. The Boring Attachment is raised or lowered by means of a handwheel connected with a pair of mitre gears. The spindle is bored to take standard size bits and can be arranged for a hollow chisel mortiser. Special cutters may be used by removing the throat in the table. Each machine is furnished with one ten inch saw, belt and wrench.

Write for prices and pamphlet describing this time and labor saver more fully.

An Efemco Product

For Square or Round Post Tubing

The New EFEMCO Bed Castor

An improved metal bed caster of remarkable rigidity. The leaves of the spring are forced together as spring is inserted in tube. But the groove, you'll observe, at base of spring, allows stem to turn freely. Top of stem is swedged—so there's not a chance of this caster slipping loose. For square or round post tubing, it's the caster that "won't come out."

This caster is made in both ball and roller bearing types. Up to 1½ in. size it is furnished with cupped washers. Above that size, with leg mounts.

When ordering kindly specify maple, lignum vitae, steel, iron or fibre wheels.

Write for catalog showing new lines of improved **Efemco** Casters.

prompt attention in handling this loss as the fire took
place on May 10th, was adjusted on May 17th, and
your cheque was received here on May 20th, which, so
far as we know, is almost a record in fire adjustment.

We can assure you that your promptness is
appreciated and that you will get a reasonable share
of our business in the future.

Thanking you, we are

Yours truly,
(Signed) H. G. McDermid
Secretry-Treasurer.

HGM-B

The above letter speaks for itself and, as usual, our check was the first received

We are not the largest fire insurance organization in the world, nor are we the oldest, but we have the strength of the strongest and our check is always first.

HERE IS OUR RECORD. In the past two years there have been sixteen heavy fire losses and with all the different forms of insurance mediums interested, in fourteen cases our check was first, the other two cases it was second.

Licensed in Canada and legal everywhere

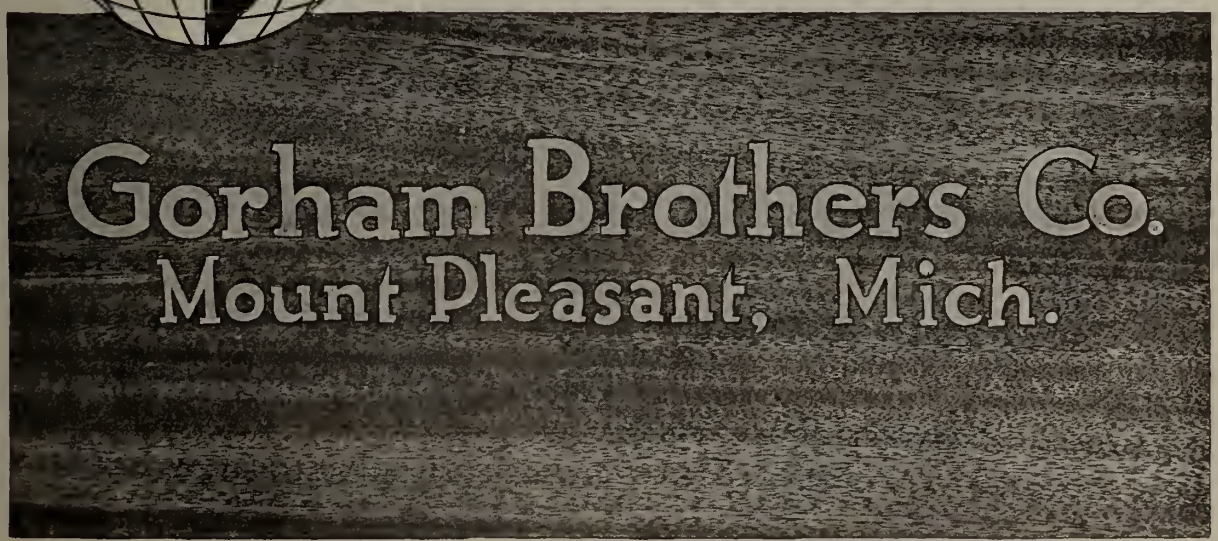
GORHAM PLYWOOD

is well and favorably known in Canada as well as the States and its use in the form of Tops, Drawer Fronts, End Panels etc., in your product, will be a long step in securing the confidence of your customers which will result in orders and re-orders.

Our trademark is stamped on the back of every Top and Panel we make. Our guarantee that it is right and will stay right.



The Door Carrier System

Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.

Ask for catalogue.

Since Colonial Days

Oak Floors have been the standard in representative American homes.

Oak Flooring is recognized — almost by second nature — as the *best* flooring material for homes of every type and size.

In public and semi-public buildings, apartments, hotels and offices it is the logical *first choice.*

Bruce OAK FLOORING THE BEST *Oak Flooring*

has definitely established its super-excellence in homes and buildings from Coast to Coast.

In addition to its intrinsic worth, Bruce Oak Flooring affords the trade a merchandising service seldom equaled in precision and convenience. *Dealers can always get it.*

Square edge parquetry strips, Oak trim, mouldings and hardwood lumber in the same car with Oak Flooring if desired. Prices and particulars on request.

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS ALL WALNUT"

AMERICAN WALNUT

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS ALL WALNUT"

"The Cabinet-wood Superlative."

RISING TIDE FOR AMERICAN WALNUT

The steadily rising tide of public interest and public faith in genuine American Walnut furniture has developed to the point where buyers are insisting that *their WALNUT be ALL WALNUT.*

Furniture manufacturers will profit by this sales barometer and plan their production of American Walnut furniture accordingly.

It is a very practical assurance of quick moving stock and satisfied customers.

Our National campaign of advertising is featuring this slogan—

"BE SURE YOUR WALNUT IS ALL WALNUT"

AMERICAN WALNUT MANUFACTURERS' ASSOCIATION

ROOM 1019 616 SOUTH MICHIGAN BOULEVARD CHICAGO

Reese Sheriff Lumber Co.

WILLIAMSPORT, PENNSYLVANIA

Manufacturers of

Northern and Southern Hardwoods

With special attention to **Oak, Chestnut, Poplar, Cherry, Walnut, Gum and Basswood.**

OUR MOTTO

REASONABLE PRICES—that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

BY MAKING TEST RUNS OF YOUR LUMBER

You will find that our stock will reduce your costs to a minimum and improve the quality of your product. Indiana hardwoods cost no more than the other kinds—then why not use them ?

We are the largest hardwood producers in Indiana and give below a partial list of stock on hand:

"What Others Say"

"Your letter of February 15th received and we want to say that this was a very nice lot of lumber. It was good widths and lengths and well manufactured, dry stock and the grading was very liberal. We are sorry we cannot use more of this lumber at the present time. *We received several cars from other manufacturers at a cheaper price but the lumber was not nearly as satisfactory.* When we are in need of more stock we will take the matter up with you."

(Note—The above was sent us February 24, 1921 unsolicited. Name given on application).

From Tree to Consumer

For nearly thirty years the Chapman and Dewey Lumber Company has cut the timber from its own hardwood lands in the famous St. Francis delta region of Arkansas, sawn it in its own mills and sold the lumber through its own offices. From the cutting of the trees until the last board is loaded on the cars this company handles its entire product. The result is low cost of operation and economy in selling —distinct savings which the customers of this company enjoy. When you buy from Chapman-Dewey you buy direct from the tree.

This Company can offer at this time some exceptional quotations on Hardwoods for a great variety of manufacturing purposes. Wire our expense for quotations.

Lumber Can't Be ALWAYS Good Without Perfect Piling

The *correct* drying of hardwood lumber is a science based on definite formulae. Recognizing this, our yard was *built* to insure the most perfect possible drying.

Everyone familiar with lumber will recognize what the appearance of the piles in the accompanying photograph means. They are your guarantee of flat, straight, clean lumber.

Our list includes the standard species and grades of southern hardwoods with NOTHING PICKED OUT, and has behind it a comprehensive and conscientious desire to give the customer his full measure of value and service,

Wisconsin Lumber Company
Chicago, Illinois
BAND MILLS, DEERING, MO.

On October 17, 1906 the S. S. "Corinth" sailed from Axim, Gold Coast, Africa, to Pensacola, Florida, with the first full cargo of mahogany logs ever shipped from the continent of Africa.

Prior to 1860 complete cargos had sailed from Africa, but the holds were laden with human freights from which was manufactured the great American Civil war.

From the valuable cargo aboard the "Corinth" was produced the beautiful and the useful—a contribution to the prosperity and civilization of America.

To the successful venture of this pioneer ship is largely due the position and influence of African Mahogany in the wood artistry of today.

It is immaterial that the Mengel Company were the operators of this ship and the owners of this cargo.

Vol. 21 Toronto, August, 1921 No. 8

What About Standardization?

Standardization, as applied to mouldings and all forms of interior woodwork and also standard window and door openings, has been discussed from time to time in the " Canadian Woodworker."

The benefits and advantages to be derived from the adoption of uniform sizes and designs by the millwork industry are so numerous that it is difficult to understand why some definite move has not been made, having this end in view. True, there are those who oppose and pooh-pooh such a suggestion, but when brought down to brass tacks, it is usually found that their antagonism is founded upon fear and selfishness—they are afraid that standardization would enable others to compete with them in what they like to consider their own territory. On the face of it, it would appear that objections based on a fear of competition, are an admission of weakness, as they would seem to indicate a conviction that other plants are able to manufacture and sell similar products for less money.

If that is the strongest argument that can be brought forward against the standardization of millwork, the sooner such a step is taken by the industry the better. With a uniformity of output, competition would, undoubtedly, be keener, but is that a thing to be feared? Lack of competition tends for inefficiency and high prices, so that if faced with increased opposition, the operator of each individual plant must give greater attention to its equipment and the methods followed, and must also make all changes and improvements necessary to enable him to compete, on at least an equal basis, with the best of the outside manufacturers. Again, service would become more than a mere word ,to be spoken lightly. It would become a reality, for in the long run it would be the plant best prepared to give service that would be able to successfully meet and overcome all outside competition.

The operator of a large plant in the Grand Rapids, Michigan, district decided not to wait concerted action on the part of a number of woodworkers, but to standardize his own line. He made a canvass of his territory and then went back through records covering the material sold during the past few years. This enabled him to determine the sizes of doors, windows, sash, etc., that were in strongest demand. The sizes and designs of mouldings, trim and other woodwork were checked up in the same way. From this information he was able to adopt patterns and sizes that seemed particularly suitable for the requirements of his trade. The result was that he was able to reduce his stock without impairing the selection, for he still carried a complete line of standardized doors, sash, frames, mouldings, etc. He found that by eliminating non-essentials and lines for which there was little demand, he was able to reduce prices slightly and increase the volume of business done.

When asked as to whether or not he found standardization profitable, he replied:—" Yesterday afternoon about 4 o'clock we sold the finished doors and windows for three houses, with the understanding that we were to deliver them, complete, the next day. The only reason we got this order was that because a competitor could not make delivery of the jobs complete, and we could. There is no question in my mind but that there is a saving of from 10 to 25 per cent. to be made in the building of the ordinary home by using this standardization method."

There will always be a demand for special work of various kinds. This business could be handled either by a separate department in each plant devoted entirely to detail work, or by certain plants which might cater solely to the demand for special or non-standardized lines.

For the woodworker catering to the general building trade, standardization offers numerous advantages. Naturally, concerted action by the whole industry would be best, but from the illustration cited, it would appear as if each individual would be able, through standardization, to reduce his stock, give better service, increase his sales, stimulate the demand for building material, and make more money.

In considering this question, the advantages to be derived from the use of standardized dimension stock should not be overlooked. Immense savings can be effected in freight, reduction of waste, and lowered manufacturing costs by as much raw material as possible, in the form of dimension. Were such a practice to become general, it would result in a greater utilization of our forest wealth. The prediction has been made that the time is not far distant when huge plants will be established at the larger lumbering centres to cut dimension and partly manufactured stock for furniture, sash, door, and other similar plants.

What the Furniture Exhibitions Taught

New Lines and Low Values Bring the Business—Buyers Demand Full Money's Worth —Public Must be Aroused from Lethargy by Attractiveness of New Designs.

Results of the furniture exhibitions held in Grand Rapids, Chicago, Evansville, and other American furniture producing centres, would seem to indicate that, below the line, conditions in the furniture field are rapidly returning to normal. By " normal " is not meant the large volume of business which prevailed during the boom periods of 1919 and 1920, but rather to the average amount of business done during the years preceding that period.

Of all the exhibitions held, that of Grand Rapids was, probably, the most satisfactory. The attendance about equalled the high record established during the July market of 1919, while the volume of orders placed cannot be considered anything else but satisfactory. In some respects the buying might be termed " spotty," for certain manufacturers secured sufficient business to keep their plants running at capacity for the remainder of 1921, while others were not so fortunate.

New Designs and Attractive Prices

Design and price are given as the reasons for this variation. Some of the more far-sighted and aggressive manufacturers brought out entire new lines and offered them at compaartively low prices. This must not be taken to mean that the prices were below cost of production, but rather that costs were figured at rock bottom, based on present replacement values, and that profits were cut to a minimum, expecting to make their money on the large volume of business which they hoped to secure. Other manufacturers, the unfortunate ones who did not fare so well, merely offered their old lines at prices which the buyer did not consider to be sufficiently low.

The attitude of the retail buyers in attendance was to shop around, compare values, and place their orders where they considered they got the most for their money. Their contention was that they could sell only furniture that was new and, perhaps, startling in design, and which was quoted at bargain prices. The consensus of opinion of the manufacturers was that the prices asked represented values as low as they ever will be, and that the next move will probably be higher.

Styles Show Greater Originality

Those who brought out new designs seem to have departed somewhat from the period furniture which has been in such strong demand during recent years. Many of the pieces shown lean toward the old Colonial, only much more simplified and less massive. What really has happened is that the American designers have taken their motifs from such old masters as Chippendale, Hellplewhite, Adam, and others, and have added so much of their own thought and individuality to their designs, that the resultant product cannot be termed a reproduction of any of the older periods. It is expected that if this tendency develops, before many years the design of the product of certain plants will be known by the name of the designer or of the manufacturer.

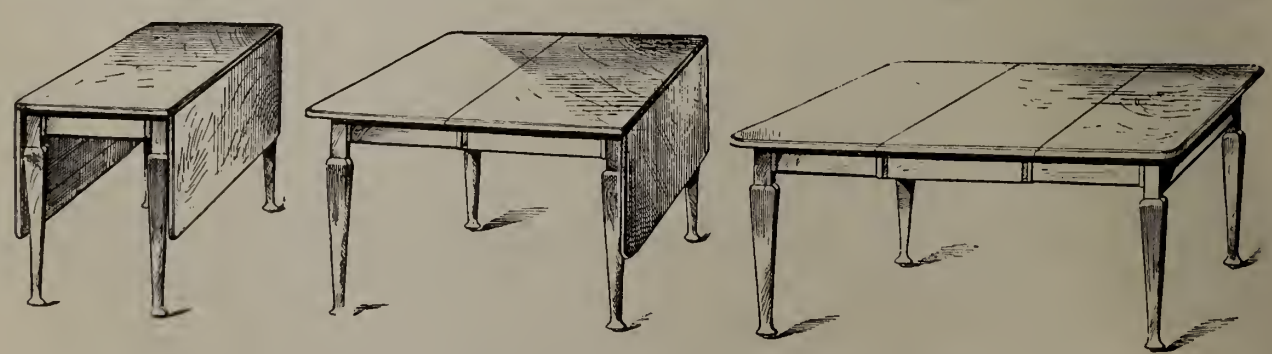
Oak Gaining in Popularity

Furniture in Italian design was to be found in abundance, but even these took on new form and new shape. The polychrome finish was used to an extent never before witnessed, and massive, sombre pieces of Italian furniture were to be found brightened and decorated by bright, glaring colors applied in a harmonious, attractive manner. Painted furniture was also conspicuous in most displays. Some of this was decorated with hand-painted decorations in a very attractive manner.

Probably one of the most interesting developments noted was the increased use of oak. This would seem to indicate that this attractive wood is once more coming into popular favor. Of course, the old Golden Oak finish, with its sharply contrasted markings, has gone, its place being taken by some of the newer finishes in softer hues and tones. Another departure in the use of oak was where manufacturers of high-class mahogany and walnut suites are using quartered oak for their drawers and interiors. By making the interiors so attractive, they have added much to the value and salability of their lines.

All the above might also be said of the Chicago market, with the exception that, if anything, it was more spotty. The present market has often been termed a " buyers' market," and the results of these exhibitions would seem to indicate that this is true. Those manufacturers who went out of their way to give to the dealer what he wanted in design, quality, and price, were amply repaid for the expense and trouble involved, while others who thought they could knock a little off the price and get away with it, were sadly disillusioned.

In addition to the orders booked during the exhi-



New type of extension table recently placed on the British market.

bitions, the furniture men were of the opinion that the August road sales would show a very gratifying increase. If their expectations should be fulfilled, it would be due partly to the confidence and goodwill created at these exhibitions, and partly to the fact that many of the retail dealers intend holding August clearance sales, in an endeavor to clean out the balance of high-priced stock which is on their floors.

Trend of Upholstery Design

Among the displays of upholstered furniture made at the exhibition held in Grand Rapids recently a distinct change was noted in the style and design. The pieces shown were more distinctive and more elegant than the older designs, and more of the frame was in sight. It would seem as if there is an effort being made to get away from the bulky appearance of the stuff-over furniture, and without detracting from the comfort which must be embodied in such pieces to produce a more attractive and artistic article. This was shown in the thin arms with lighter upholstering found on many of the suites. On the whole, the design of the frames was more along period lines, both with regard to the stretcher work and the upper parts. Some of the pieces had a decidedly frail appearance, but were solidly built in such woods as mahogany, walnut, oak, and gum. Th range shown included all the better-known periods covering English and French designs, also including furniture of the Italian Renaissance style. It has been predicted that another season will see a stronger leaning toward the French style of furniture.

Many of the lines on display were covered in brown sateen, with the seat made up of one long cushion rather than three, as has been common of late. The idea of using this covering was to enable the purchaser to choose a covering which would harmonize with the draperies and decorations of the room in which the piece is to be placed.

Some of the upholstered furniture was very elaborate in design, consisting of elegant davenport suites in polychromed Italian Renaissance style. In coverings, the velours and tapestry are still in common use, although greater care was taken in the selection of the coverings shown.

Trained Engineers are a Vital Necessity

High Speed Production the Ideal—Reduction of Waste a Big Problem—Poorly Designed Shavings Exhaust System Expensive Installation—More Practical Information Required

By Sern Madsen, Curtis Companies, Inc., Clinton, Iowa.

The field for the engineer in the woodworking industry has fast been developing in the last two decades. The small isolated shop is giving way to the larger, more efficient factory. Only in larger specialized factories can woodworking really be put on a high-speed, production basis. Only where a large quantity of like parts can be produced will it pay to develop highly specialized machines. In no other industry, perhaps, is the product more diversified than in the average small woodworking plant. Generally, but few pieces are machined alike. This, more than anything else, has retarded the use of specialized machinery in woodworking plants. In the sawmills, this condition has not prevailed, and the result has been a very efficient arrangement of machinery, conveyors, etc.

Reducing Waste Bill

We are just in the midst of a tremendous change in woodworking development. The problems presented to the engineer cover a very broad field, so that there is enough variety to make the work fascinating. Aside from lumber drying and machine design, the engineer comes squarely up against the problems of waste utilization, power development, electrical equipment, dust collecting systems, heating and ventilating, safety devices, factory and machine maintenance, material handling, and many others. It is doubtful is any other industry will offer a mechanical engineer better opportunity for service and at the same time such a diversified list of activities. At some time or other, he will find need for every little bit of knowledge that has been tucked quietly away somewhere in his gray matter ever since he left college.

In order to better illustrate the scope and importance of some of the above-mentioned problems, let us briefly consider a few of them.

Utilization of waste is one of our large problems. Gradually we are cutting lumber closer to the knots and using a little more cross-grained material. This requires better cutter heads. There are always a lot of edgings. These are used for mouldings, dowels, lath, etc., but even yet too much of this finds its way to the boiler furnaces. There are thousands of board feet wasted in cutting out knots and trimming off boards to length, but the big problem is to find a way to use these smaller scraps. Generally, these scraps are too cross-grained to use for matches, toothpicks, or other small articles. Perhaps some day they can be used for making pulp or fibre board. It may be possible to distill from the knots such useful products as turpentine, tar, and the like. Along these lines the possibilities are unlimited, and it remains for someone to step in and turn the trick.

A modern plant usually produces nearly enough chips, shavings, and sawdust to supply its entire needs of fuel for heating and power purposes. Lacking a better way of disposing of this refuse, it is at present fortunate that it has even this important use. Ordinarily, woodworking power plants operate non-condensing, for the simple reason that during about seven months of the year the exhaust steam is all needed for heating purposes, and for dry kiln purposes it is needed the year round. It is true we have a surplus of exhaust steam during the summer months, but also at that time we have an abundance of shavings and sawdust which must be disposed of. If we operated condensing in the summer time, we would have to dispose of shavings and sawdust in other ways. The market for these has not yet become great enough to pay for their transportation.

In this whole scheme it can be seen that there are possibilities of large savings.

Economical Burning of Refuse

The problem of burning shavings economically has not yet been solved in nine-tenths of the woodworking plants. Many plants spent thousands of dollars in coal bills that might be saved by the adoption of better firing methods in the boiler room. The firing of shavings is very much like using powdered coal. The essential sof economical combustion depend upon constant automatically controlled feeding of fuel and perfect control of air supply properly distributed through the grate surface. Apparatus for attaining these ends still needs to be installed in 95 per cent. of the woodworking power plants. Waste due to poor combustion and other bad boiler room conditions will average between 20 and 30 per cent.

The constant attention of a competent engineer is needed to maintain economical operation of the boiler and engine room equipment. The modern plant will distribute its power electrically, and for this, 3-phase 60-cycle 220-volt current seems to be the most popular. Wastage of electrical power needs to be constantly watched. It may be safely stated that the average plant wastes from 20 to 30 per cent. of the power delivered at the switchboard.- Certainly here is a field of endeavor for the most ambitious mechanical engineer.

A Prodigious Power Waster

Dust and shavings collecting systems serve a double purpose. They keep the air free of dust for the operators of machines, and at the same time transport the dust and shavings to the boiler house. An efficient system is indispensable to the success of a woodworking plant. Engineering data on dust collecting systems is not very generally distributed, but an enormous amount is available to the one who desires it. Perhaps no other equally important equipment is so little understood, and surely no other equipment has so great possibilities in wasting or saving power. A high-powered system may be practically useless, while an economical system may be highly efficient. It is absolutely unfair to expect anyone but an experienced engineer to make a thorough job of a blow-pipe system. It is simply appalling to think of the power that is wasted every hour of the day and every day of the year on inefficient blow-pipe systems that have been installed by incompetents. The fact that the power required to drive a fan increases as the cube of the speed, is an unknown rule as far as the average woodworking plant is concerned. In many systems it is possible to save from 25 to 50 per cent. of the power now used to drive exhauster fans if the installation were correct. It is little short of criminal the way a large share of our blow-pipe systems are installed. When the mill owner wakes up to this fact, he will seek the services of an engineer who understands the work.

Many interesting possibilities present themselves in motor applications. Wherever they are direct connected motors, speeds need to be considered. We have thus far been limited to certain fixed speeds of the polyphase induction motor. An entirely new field of possibilities has been opened up by the recent placing on the market of frequency changers. Ordinary 60-cycle current gives us no speeds between 1200-1800 and 3600 R.P.M. We have need for speeds of approximately 1500, 2400, and 4500, or higher. Perhaps some day these speeds will all be available by the use of 75-85 cycle current in addition to the present 60 cycle.

Authoritative Information Lacking

In almost every other industry we have an abundance of magazine and books which deal with its mechanical equipment. It is true that we have some very progressive magazines covering the woodworking industry, but good books are decidedly lacking. The Civil Engineer has his "Trantwine," the Architect his "Kidder," the Electrician his "Foster," the Mechanic his "Kent" or "Marks," and the Machinist his Machinery Handbook, but the woodworker still has no authoritative handbook. Our public schools have fairly good courses in Manual Training, but these fall short of actually training the industrial woodworker. We have elementary texts and elementary methods of teaching, but what we need are thorough, comprehensive, and authoritative sources of education in woodworking.

At present a mechanical engineering course comes to the nearest in preparing one for dealing with woodworking methods and equipment, but his four years' college training are as a primer compared with the things he has to learn after entering the shop. There is a tremendous need for the trained technical man in the woodworking industries, but for the present he will have to be largely trained on the job. In all industries this is largely true, but in no case is it so apparent as in woodworking. He must be a self-seeker after knowledge, for as yet no college or university offers him a complete course in this ancient and important art.

It is not enough that technical knowledge and help is available to the woodworking industry. It is absolutely essential that more technical men must be empolyed to be on the job all the time. The industry must avail itself of every chance for improvement, and at the present time there is no surer way than to engage the services of the engineer. It is up to the woodworking industry to take the best trained men available and train them further. It must not expect too much of these men until they have graduated from a full course in the modern woodworking shop. It will require a very earnest co-operation between the woodworker and the engineer to achieve the goal which this ancient but re-born industry deserves.

BOILER EFFICIENCY.

The boiler room should not be the abode of dust and grime as is so often the ease, but should be regarded just like any other part of the works, and should be kept correspondingly elean. The walls should be whitewashed frequently, so as to make the plaee light and pleasant to work in, and the floor should be swept daily. Coal dust and cinders should be eleared up at least once a day and not be scattered about the floor for months.

Not only should the place look respeetable, but the routine work should be redueed to a system so that it is done in an orderly manner and with less fatigue than is often the ease.

Attention to the boiler gauge is essential in order that the firemen may know exactly the pressure of the steam at any moment. The gauge should be plaeed where it ean be seen readily in the daytime, and at night should be illuminated.

Make Your Office Advertise Your Business

Attractively Finished Office Adds to Prestige and Creates a Demand for High Class Woodwork—What More Progressive Woodworkers are Doing—Display Product to Arouse Interest and Increase Sales.

We all have our opinion of business men or business organizations which are not progressive, which do not try to improve their methods or their product, which are living in the past rather than in the present, working for the future, which are content to sit back waiting the pleasure of the gods rather than assuming the aggressive, attempting to stimulate business and becoming a power and an authority in the community in which they labor. Your opinion is, probably, the same as the writer's. We are all more or less affected, because this class is all too prevalent in the woodworking industry. There are some woodworkers who seemingly have been in a rut for years, and who should be given a jolt that would arouse them from the state of complacency into which they have fallen and cause them to give heed to the trend and development of the times. One earmark of this type of woodworker is an untidy, unattractive, ill-kept, poorly-finished office.

What is an office, anyway? What is it for? Is it merely a place in which the accounts are handled and the various transactions and details of the business recorded, or is it the place in which the customers and other callers are received, business transacted, and sales made? If the former, almost any kind of a place will do, as its location and equipment are unimportant. If the latter, it is the very physiognomy and heart of the whole organization, and should be treated accordingly.

Judged by Appearances

Would you deal with a tailor who habitually value the advice or opinion of a shoeman who dressed in ugly, ill-fitting garments, or would you clothed his feet in shabby, down-at-the-heel shoes? What must be the opinion of the prospective purchaser of fine woodwork, who upon entering the office of the local authority on things pertaining to this line, finds himself in a dusty, dingy, poorly-kept office, a place in which fine woodwork, as represented by attractive interior trim and fine furniture, is conspicuous by its absence? If first impressions are the strongest, he would likely think that he has come to the wrong place either to give an order or for information and suggestions.

Not only does the office, in the way it is fitted up and furnished, present an opportuinty for creating a favorable impression upon all who enter, but the publicity and sales-producing power of a well-furnished office must not be overlooked. As a means of educating the public to the attractiveness and desirability of high-grade woodwork, it is in a class by itself. Where the office walls are enriched with well-designed panel work and trim, and where the counter and other office fixtures represent the highest development of the woodworkers' art, a favorable impression is created and a desire aroused to possess attractive woodwork of a similar nature for the home, office, store, church, or lodge-room.

Of recent years some of the more progressive members of the woodworking industry in Canada have turned their attention to their offices, with the result that this end of their business has undergone a development from which the office emerged transformed and modern in every respect. Some have

P. W. Gardner & Son, Galt, Ont., realize the value of an attractive office.

erected handsome office structures, while others have been content to instal high-class woodwork, and thus bring this department in line with their ideals.

Increases Demand for Good Work

Some of the newer developments along this line are to be found in the accompanying illustrations. As intimated before, first impressions count, and these modern buildings can hardly help but create favorable ones. Not only that, but an attractive office lends an air of distinctiveness that could be secured in no other way. The psychological side of having a fine office could be dealt with at much greater length, but suffice to say that not only are all who enter influenced, but it has a subtle effect on the management and every member of the organization.

Another phase of this subject that should be considered is in connection with displaying the products

The visitor cannot help but note attractive woodwork. R. Laidlaw Lumber Co., Toronto.

of the plant. Not only will the attractive woodwork of the office create a desire for fine interior trim and panel work, but by making a striking display of the finished output of the plant, sales can be made in many unexpected directions, and the volume of business increased. Some woodworkers have fitted up display rooms in connection with their sales department which are veritable stores of attractive wood products, both finished and unfinished. This departure is illustrated in a number of the views shown. By finishing each side of a door or piece of panel differently, it becomes an easy matter to show a customer what a certain item will look like when stained, painted, or enamelled.

Uesd for Selling Purposes

The Watt Milling & Feed Co., who operate a large woodworking plant in Toronto, have carried out this idea in finishing their recently completed offices. An interior view, showing one corner of their main office, will be found among the illustrations. The main office is finished with selected oak. Panel-work, trim, counters, and other fixtures are of the same material. Each of the private offices, of which there are four, are finished and panelled in a different wood. Thus, if a customer wishes to see what a door or piece of panel work in oak, gum, walnut, mahogany, or chestnut looks like when completed, he can be taken to the part of the office finished in that particular wood, and the many beauties and advantages of it pointed out in a convincing manner. This is merely applying modern sales methods to the selling of woodwork.

If your office could best be described as a hole in the corner or cubby-place in which an accumulation of shavings and dust is visible on all flat surfaces; in which the floor and counters are littered with odds and ends from the shop, and which is anything but attractive, it might be well to take these suggestions to heart. Money spent in sales-building, confidence-creating work of this kind is money well spent. Another point is that the woman of the house is taking an ever-increasing interest in the woodwork of her home, and as a result you must make your premises attractive to her. The business which is influenced by the lady members of the family, will, certainly, go to the plant which caters to her tastes and comforts, and which provides an attractive place in which to conduct all business.

Let us face this thing squarely. We are all interested in raising the status of the woodworking industry to higher levels, in creating a demand for better woodwork, in educating the general public to the intrinsic worth and value of attractive surroundings. We are supposed to be experts in all phases of fine woodwork; our opinions are supposed to carry weight and authority. Surely it is not unreasonable to expect that before we are to be looked up to and consulted, before our opinion is sought and considered, we must give a visible evidence of our skill and our ability in this direction. This may be best accomplished by finishing our offices in a striking and impressive manner. Let each and every one endeavor to place and maintain not only the office but the whole plant on a plane compatible with the great industry of which we are a part.

ROTARIANS LUNCHEON AT WOODWORKER'S PLANT.

On Wednesday the 27th July, Messrs Radford-Wright-Wilson Co. Ltd, Winnipeg entertained nearly two hundred Rotarians at a luncheon held at their premises.

The lunch was supplied by the young women's Society of St. Andrews Presbyterian Church, who waited on the tables. Three long tables very daintily decorated with cut flowers, accommodated the guests, After a very enjoyable luncheon, the Rotarians listened to a very interesting address delivered by Mr. Howard Crocker, of the Y.M.C.A., Winnipeg, his subject being " Physical Culture."

The Rotarians before leaving the plant, were taken through the factory by members of the staff, who explained the working of the machinery, etc. The guests were highly pleased with their visit, and congratulated Mr. Wilson on the splendid buildings, and the exceptionally clean way in which the factory was kept.

A sectional chip breaker is a modern addition to a planer, which is very helpful for many things.

Cheaper Instead of Greater Production

How Manufacturing Organization is Analyzed with View to Bringing Down Costs—True Value of Accurate Costs

By William Snaith, C.E., Associate Engineer with Forests Products Engineering Co., Chicago.

The article by Mr. E. W. McCulloch in the June "Canadian Woodworker and Furniture Manufacturer" on the "Distribution of Burden of Good and Bad Times" is by far one of the best discussions of a very timely subject. The writer is heartily in accord with the principals so well stated in the article. If it were not for the fact that it is the exception rather than the rule to find these principles adopted it would not be worth while to thus express agreement. The advocate of such methods is more likely than not to get a cold reception in the average manufacturers accounting office. Probably this arises somewhat because slightly more work is involved, but mainly because the accounting methods of the average business man have a long way to go before they come up to modern standards. Few realize that in the last decade or so accounting science has practically been remade. The coming of the Income Tax and other similar afflictions will perhaps turn out to be very much in the way of blessings in disguise if they lead to better methods of keeping records in the business world. It may not be too much to expect that the economies they will lead to will more than offset the actual outlay of money they call for.

It has been proved in numerous cases that a business with old-fashoned methods of accounting can go on showing profits while actually losing enough to wipe itself out in ten or twelve years. As soon as such a condition is revealed to the average executive he will turn to a Cost System like a drowning man clutching at a straw and it will likely stand him in as good stead. This is not said with any idea of belittling cost systems. They are as necessary as any other of the accounting records of a business but they are not cure-alls. One of the latest to join the division of the new science of accounting, they really are yet in process of digestion by business. Far too much has been claimed by some of the experts making a speciality of such systems and there is perhaps something of a reaction against what the average man feels is "red tape."

Bringing Down Costs.

It is not proposed to point out defects in cost systems or to explain why some of them have faied. It is a difficult thing at best to start any new idea and the process is one of trial and error to a large extent. The purpose of this is to emphasize the fact that more than a cost system is required by the average manufacturer at the present time. A cost system is part of an accounting system. The accountant keeps the records of the business, and Mr. McCulloch's article will guide the accountant to a more accurate record of one phase of his work. The article just touches on the fringe of another subject which is however, not lacking in interest and that is: How to lower costs in the face of falling demand, falling prices and with overhead not falling at all.

Just how seriously this question is being considered can be judged from the fact that in February of this year it has been estimated that one-third of the business houses of America were potentially insolvent in the sense that they could not possibly have paid their current debts. In Canada and the United States nearly four and a half million people are are out of work and there are other evidences of the depression which surrounds us. There may be good reason to believe that the worst is over, but there is a long pull ahead before times will justify the epithet "good."

What the manufacturer wants to know is how to make whatever he produces for less money than he ever did. To lower costs is his obession and the thing he thinks of and must think of all the time. His cost system is very likely telling him that in spite of some increase in the efficiency of labor his unit costs are not coming down very fast. The workman is on the horns of a dilemma. If he hustles and finishes all the work in sight he'll be laid off; if he dosen't hustle he'll be replaced by one who will. We are all human and any of us under these crcumstances would compromise. A lot of bad habits engendered by the war conditions of the past years when production practically regardless of cost was the rule, are with us yet. These must be eradicated and yet we have become so accustomed to some of them they seem only necessary evils.

Cheaper Not Greater Production.

"Cheaper production" takes the place of "more production" as the password to success. To the industrial engineer rather than to the accountant must business, and especially the woodworking industry, turn at this juncture. The accountant is giving business better records than it ever had but more than records is required. The industrial engineer brings to the problem of cheaper production the scientific methods of analysis and standardization, followed by a properly designed system of production control and a wage payment system where reward is in proportion to skill and work done.

Production readily stands first in the four divisions of business—production, finance, accounting and selling. It is the foundation on which the others build. Without production there is nothing to finance or sell and no need of records or accounting. Cost of production can not be lowered by the best system of records that the most brilliant genius can devise. If the cost of a piece of work is to be reduced it must be done before the work is started. Some saving may be possible while the work is underway but none at all when it is finished. Many a job which was started right has been spoiled when nearly finished by attempting too late to keep the cost within an estimate which was too low to begin with.

Records of past performance can be used in estimating future work only, (a) if the conditions have not been changed and (b) if the records are accurate and dependable. It is the exception rather than the rule for either of these conditions to be fulfilled. More especially is it exceptional for the records to be either accurate or dependable and when they cannot be relied on they are really worse than useless. Inaccurate cost data can only lead to inaccurate estimates. But even

if both conditions are fulfilled to perfection the most that can be hoped for will be that costs will not be higher than they were. There still remains the possibility which amounts almost to certainty that the old costs were unnecessarily high. What is lacking is a standard wherewith to measure performance. We can estimate with precision how much material will be required to make a certain article of furniture but when it comes to the labor cost we have not the same exact basis for our figures. We know (if our cost records are accurate) that a somewhat similar thing cost us so much at such a time for labor. Could another shop do it for less? They couldn't use less material, but could they put less labor on it? What should be the minimum labor cost? To supply the answer to these queries is the function of the industrial engineer.

Analysis of Product.

The first step in studying production is to know what is to be produced. This may sound somewhat trite, but the mere cataloguing of all the articles to be made in an average plant serves several purposes and will likely reveal some such conditions as these; some old lines which are obsolete and should be dropped, several articles which are so nearly alike that it is unprofitable to continue the distinctions; the main product for which the demand is known and new lines for whch demand is to be created. This list will vary from one single article to several hundreds of thousands with the size of the business. After this has been gone over carefully and all deadwood eliminated a list of all the component parts of each article is made. In the discussion of standardization we shall see that as far as possible the designs are modified to permit the same part being used in a number of articles. Our third list gives us all the operations on each separate part in their proper sequence.

A survey is next made of the machines and tools available for turning out the product. The speeds and feeds are determined and the capacities noted. Their condition is investigated as having a direct bearing quality. The layout of the whole plant also calls for study under this head. If possible the raw materials should enter at one end and the finished product leave at the other, but in actual practice this condition is a rarely attained ideal. The extent to which backtracking and unnecessary moves can be avoided is usually considerable. It is to be borne in mind in this connection if the moving of machines is called for that such expense will be incurred but once, while the cost of any additional handling or trucking is a continuing expense which may be sufficient in even a short time to pay for the change.

The study of the materials used and the manufacturing methods used need not be discussed under this head, although their analysis forms a part of the complete analysis of the product. They will be dealt with in connection with standardization.

Standardization is Foundation.

The foundation stone of modern manufacturing is standardization. It is not enough to standardize the product itself; the methods and machines must be standard also as well as the materials used. To a certain extent the men who do the work must come up to a certain standard, although it is likely that some of the steps in this direction by some authorities go further than is necessary. It is the part of wisdom to select men with some regard to the work they will have to perform, using size and strength for heavy work and skill and experience for the finer lines. It is variously estimated that the cost of breaking in a new employee runs from $50 to $250 and in special cases to much higher figures. Cutting down the labor turnover results in a saving which can almost be measured in dollars and cents.

In the case of materials when once the most suitable material has been found a brief specification covering is prepared and future orders must conform to this. In the case of small parts such as nails, screws, bolts and nuts a complete description is prepared so that no difficulty will be encountered by a firm receiving an order for them in filling. In these days of specialization there are so many varieties of even the simplest things that the chances are multiplied of getting something sufficiently different, although of the same class, for the variation to be serious.

After trying out various methods or different series of operations the best and most economical is chosen as the standard and this will be adopted for all future work until a cheaper of better way is devised. The extent to which it will pay to experiment in determining the best method of performing an operation will depend on the number of times it is performed. In the case of special operations in repetition work where the same operator is constantly engaged on the same operation the ultimate developments along this line is motion study with a motion picture machine. The classic example of painstaking study in determining the best set of motions is the series of experiments by Mr. F. W. Taylor on shovelling in the plant of the Bethlehem Steel Company. When once the best method has been decided on it is written up in the form of standard instructions to govern all future work.

The industrial engineer is not usually responsible for matters of design, but as a general thing the establishing of a system of standards will reveal possibilities of changes in existing designs in the direction of further standardization. The same part can perhaps be made to fit into several articles. Where a varied line of goods has been made for some time without any special attention to this feature the standardizing of designs is likely to result in some surprising economies. It is not at all uncommon to reduce a diversified list of similar parts to one quarter or even one tenth without perceptibly changing the appearance or in any way detracting from the quality.

Wage Payment Systems.

Nothing else is wasted in a manufacturing plant to the same extent as labor and nothing is paid for on the same unscientific and unfair basis. In buying everything else we know ahead of time what the price is going to be and what quality to expect. In buying labor at so much an hour we may know what quality to expect but the quantity is undetermined. It is unfair to both employer and employee that this should be so. Payment in proportion to value and amount of work done can not be achieved otherwise than by some form of piece work. It is perhaps not too much to say that without standard times in which operations are to be performed and the rates of pay based thereon, it would be impossible to accurately plan the sequence of a series of operations or to make much better than a guess as to the probable cost. What opposition there may be to piece work has its cource, not in anythng inherently wrong in the system, but in the unfair ways in which it is commonly used. Piece rates have been

based on past performance without a proper study of that perfrmance to determine whether it represented a fair output produced under proper conditions. Very few men work at a rate more than half of that of which they are capable and the difference btween a man merely holding down his job and another actively interested in getting all he can get out of it is surprising. If now a rate is calculated from the output of an operator working under unstandardized conditions and only moderately interested there can only be two results. The operator with only slightly increased effort and taking advantage of the incentive to devise better methods will increase his production perhaps to double what it was before. The man who set the rate, apart from any criticism he may come in for, is bound to feel that the operator did not previously work at a fair rate and almost inevitably the rate will be cut. This will seem like an injustice to the operator and he will see to it that he does not further increase his production and thus forestall further cuts. Manifestly under such circumstances it is extremely difficult to reduce costs.

It is quite possible to determine the time an operation should take by careful analysis of the motions ar revealel by a time study and after making an allowance for personal time, machine care and incentive, to set a rate which can be guaranteed against change as long as the standard conditions under which the work is to be done are unchanged. If speeds or feeds are afterwards changed or standards of quality are altered the rate is proportionately increased or decreased, but the same financial effort on the part of the operator will result in the same financial reward. If some system of paying for suggestions which result in increased production is used there will exist conditions which are bound to reduce costs and increase output.

Many systems of bonusing all output over a specified task have been devised but all seem to have met with indifferent success. The extra clerical work involved, the smallness of the bonus, the more or less involved calculations, preventing the operatior from knowing from day to day what his bonus amounts to, the use of such terms as "tasks" and perhaps "bonus" itself, have been among the reasons for failure.

In a properly designed piecework system the rates will be equally fair to both employer and employee; the cost of work will be known accurately and in advance; wages can be raised without entailing a revision of the piece rates and old and proven employees will receive a higher wage than new men doing the same work. The result can only be satistaction, absence of labor troubles, reduced turnover and increased production.

Production Capital.

To really control production so that all necessary parts reach their sub-assemblies at the right time for the sub-assemblies to reach the final assembly in the proper sequence and time is as fine an example of organization as can be found. By anything short of the thorough analysis already outlined and without standard methods it is not too much to say that it is impossible unless the work done is very simple indeed. To explain at any length the actual methods used would take more space than would be justfied in this article. Not only does each branch of industry call for different methods, but the organization of each individual plant must be considered and its pecularites of layout, personel location, and many other things. There are fundamental principals, however, which apply universally and if these are complied with a workable system will be evolved. It is not enough to design the system. A bridge is not built when the drawings are finished, and there is as much labor involved in putting a production control system into operation as in building anything else from plans and specifications.

Above all things, such a system must be flexible. There are always several ways of doing anything and emergencies are bound to arise. The system must not be disrupted if in an emergency standard methods are temporarily discarded and work rerouted through other channels. In fact it is not too much to say that a system is a success in proportion to its ability to handle the unusual in an efficient way and quickly return to normal afterwards.

Gives Fullest Information.

The production records in the system sketched out above are unusually complete and yet there is no duplication. From them the accountant can obtain costs that can be relied on to be accurate. The selling department can make estimates with certainty. The management can use them as standards wherewith to measure efficiency of departments and men.

To sum up the need of the hour is cheaper production. This will not be obtained by systems of keeping records, necessary though these are. Costs must be lowered before the work is started. By proper analysis, study and standardization of the elements of the product followed by production control costs will be lowered, which is of present interest, and production will be increased, which is of future interest. Incidentally better and more complete records will be obtained and labor troubles will disappear.

Will Prospect Island Railway Belt

Through its subsidiary corporation, the Consolidated Mining and Smelting Company, the Canadian Pacific Railway Company has undertaken to make a thorough mineral survey of the Esquimalt and Nanaimo Railway Belt of Vancouver Island. Engineers will be engaged to inspect all prospects that have not passed out of the hands of the company and geologists will make reconnaissance of the mineralized zones of this area of over 2,000,000 acres. It is planned to obtain complete information of the mining possibilities of this section. This work will be preliminary to the negotiation of an agreement with the Provincial Government for the elimination of what is described as the "Dual Control of Minerals within the E. and N. Belt."

The Hon. Wililam Sloan, Minister of Mines, has devoted long and careful attettion since 1918 to the problem of bringing the minerals of this belt within the sole jurisdiction of the province. The progress, however, has not been as rapid or as satisfactory as he could have wished because of the reluctance of the C.P.R. to release underground resources without a more exact knowledge of their economic value and potentialities. In correspondence tabled by the Minister in the B.C. Legislature recently, it is indicated that the C.P.R. has come to realize that the present situation—requiring that title to mineral lands within the area must come both from the Province and the Company—cannot continue.

Inventor is Guiding Genius of Unusual Plant

Arbuthnot Woodworking Factory in Vancouver is Full of Clever, Practical Appliances Designed by the Owner-Manager

By Geo. S. Perry, Vancouver Representative

An all-electric-driven woodworking plant in Vancouver, which well repays a visit, is that of the Arbuthnot Lumber, Sash and Door Co., of which the moving spirit and guiding genius is Mark Arbuthnot. He is a mover all right and a genius as well, the number of special appliances of his own invention in use in all parts of the shop showing his practical genius. Some of his inventions have been patented, and others he has not taken the trouble to apply for patent rights.

One or two of the leading devices he has designed have been adopted by other woodworking plants, and some of them bid fair to be in every shop in the country before long. His measuring rule attached to the table of several of his machines, is being used by a good many mills. Mr. Arbuthnot looks to the day when no machine will be sent out by the manufacturer without his measuring rule attachment. He points out that half the time of a workman is taken up in making measuerments and changing the machine to cut to that particular measure. With the measuring rule, which he makes of steel, actually a part of the machine, the operator merely adjusts to the desired measure instantly. This change he can repeat inedfinitely, as often as the work requires. The efficiency of most of the machines used in cutting stock to measure is doubled by the appliance. The making of the rules is as original as the idea of attaching them. When he first tried to buy the rules, manufacturers in the States quoted him a prohibitively high figure. Arbuthnot is resourceful. He sat down and studied the thing out. Then he went to work and made himself a rotary die to cut the inches and fractions on the steel bars. For a trifling charge he was allowed to attach this die to one of the machines in the Wallace Shipyard shops and run his bars through, the result being that he turned out 75 accurate gauges in an hour or so.

Many Interesting Features

All through the Arbuthnot factory similar original ideas of a practical nature are put in effect. On an American shaper he has put a morticer attachment of his own device, which is as nearly automatic as such a rig could be. It is clamped on and with a series of stops, set in segment of a circle, each piece of a sash may be fed in, in its proper place, and cut to correct measure. On the same machine he has a simple attachment which makes it do duty as a panel raiser. On an ordinary cut-off saw is found a friction attachment, made with a strip of wood on an arm attached to the bearing of the saw and engaging two small pulleys. By stepping on a treadle lever,

Vancouver office, Toronto General Trust Co.
Woodwork by Arbuthnot Bros.

the two pulleys engage the strip of wood, pulling the saw back swiftly after each cut. The capacity of the machine is thus speeded up very highly. On his band re-saw, Mr. Arbuthnot has one of his most valuable and noted inventions. It is a spring tension tightener, doing away entirely with the tightener weights. In this, Mr. Arbuthnot claims to have solved the question of cracks in band saws, of all sizes. An expert band-saw man himself, the inventor points out that the unusual jar given the delicate steel band, when any sudden strain causes the weight to drop heavily, is the cause of cracking, and all band saws are subject to them. He is using a saw which had cracks when he put on the spring and

Office, factory and warehouse,
Arbuthnot Bros., Vancouver,
British Columbia

Interior view, Arbuthnot Bros ' sash and door factory,

disconnected the weights. These cracks have made no further progress, and the saw is good for long use yet.

Spring Tension for Band Saws

But perhaps the best of all his inventions, and one he has patented everywhere, is his automatic grinder for band saws. By this attachment or machine, he can grind any band saw down from one gauge to a thinner gauge, thus making a saw available for lighter use when it has been reduced in width past its original use. This grinding process will also take out all the inequalities caused by the saw-filer's hammer in setting and balancing the saw. When he is ready to go to the mills with this new device, he is going to show the big fellows where he can effect savings of thousands of dollars in extending the life of band saws, now discarded.

It can easily be gathered that the Arbuthnot plant is strongly marked by the originality of the clever inventor who directs it. For all that, it is not a freak institution by any means. It is equipped with a full line of machines for the making of doors, sash and frames, and for detail building and cabinet work. Its ordinary capacity is 150 doors and 300 windows per day. Thirty-five men are at present employed, and more are being added. It takes in all 320 h.p. of electrical energy to operate the plant, and the only steam generated is for the dry kilns and for the glueing and finishing rooms and for any heat required. The lumber is brought by truck or rail to the plant, which is located in the False Creek industrial area of Vancouver, close to many of the sawmills. The lumber goes direct to the kiln for drying. Hot air circulation with a fan system and a direct live steam pressure is the combined system of drying, thus preventing case-hardening of the wood. On the ground floor are the re-saw, a Yates machine, also a Yates 15-inch planer and matcher, a Woods 15-inch moulder, a C. M. C. 8-inch sticker, and a 3-inch drum sander by the same concern. A self-feed rip-saw is also part of the equipment. On the mezzanine floor are electrically-driven cut-off saws for stock, the lumber after going through the stickers being brought up by freight elevator. On each cut-off saw and tenon machine is attached one of the rules above referred to, greatly increasing the capacity of the machine. An American shaper and a Cowan & Co. tenoning machine, a Zimmer panel raiser, a combination door and sash sticker by the C. M. C., and a morticer are among the principal machines included in the plant. Each has its own electric motor, with independent control. Every machine is connected up with the blower system,put in by the John K. Miller Co., Vancouver, and two 50-inch fans actuated by a 50-h.p. motor carry all the shavings and dust to the storage and boiler house.

Building a Reputation

The Arbuthnot factory has the reputation of turning out some of the finest detail and stock doors in Canada, especial attention being paid to finish, in which the doors excel. Just now the factory has in hand, among many local orders, one for 600 doors for Australia. All sorts of cabinet work, office and bank fixtures, special furniture, and detail orders, are turned out, as well as meeting a big run for ordinary stock sizes and patterns of doors and sash. Mark Arbuthnot is a young man, not yet past thirty. He has spent all his working life in a woodworking plant, and with his rare inventive talents, added to his practical knowledge and extremely energetic nature, he is going to make his mark in his calling. He is a capable business man, and is ably assisted by his brother, R. Arbuthnot, who takes charge of the office. Recently the firm moved to the building formerly occupied by the Prudential Company, now out of existence. The premises are very large and allow plenty of room for expansion.

World's Coal Production in 1920

Year.	Production.*	Per cent.†	Year.	Production.*	Per cent.†
1910	1,160	39.2	1916	1,296	41.4
1911	1,189	37.9	1917	1,345	44.0
1912	1,249	38.8	1918	1,331	46.2
1913	1,342	38.5	1919	1,158	42.9
1914	1,205	38.6	1920	1,300	45.1
1915	1,196	40.4			

*In part estimated. †Produced by U. S.

The fluctuation in world coal supply become somewhat clearer if expressed as index numbers, taking the output in the year 1913 as equal to 100. The production in the other years then becomes as follows:

1910 86	1913 100	1916 97	1919 86
1911 89	1914 90	1917 100	1920 97
1912 93	1915 89	1918 99	

The manner in which the outlying countries came to the assistance of Europe is shown in the following table, which gives production in metric tons, by continents, before and after the war:

Continent	1913	1920	Inc. (*) or decr. (†)	P.c. of change
North America	531,600,000	601,300,000	* 69,700,000	*13.1
South America	1,600,000	1,700,000	* 100,000	* 6.2
Europe	730,000,000	597,500,000	†132,500,000	†18.1
Asia	55,800,000	75,800,000	* 20,000,000	*35.9
Africa	8,300,000	11,800,000	* 3,500,000	*42.2
Oceania	15,000,000	11,900,000	† 3,500,000	†20.7
World	1,342,300,000	1,300,000,000	† 42,300,000	† 3.2

How Drying Period May Be Shortened

Increasing Circulation Increases Efficiency of Kiln, Tends for Uniform conditions and Fast Drying — One of the Most Important Factors in Operation of Dry Kilns

By P. E. Poole

If a woodworker or kiln operator were asked whe ther heat or circulation was the more important in the artificial seasoning of lumber, he would probably reply that heat was of far greater importance than the movement of air. In this opinion he would be supported by the majority of those engaged in the same line of endeavor. This only goes to show how the essentials of good kiln-drying are regarded by those in the industry.

Modern kiln-drying practices emphasize the importance of proper temperature, adequately controlled, but considerable stress is also placed on adequate circulation. Ty my mind the latter is more essential than the former. If lumber were placed in a kiln in which there was no air movement, it would not dry regardless of the temperature carried. If the heat were shut off and cool air forced through the stock, the moisture would be slowly but surely picked up. This would seem to indicate that heat without air movement is futile, while circulation without high temperature is capable of drying lumber.

Both Factors Necessary.

This point is mentioned simply to convey an idea of the part that air movement plays in the kiln-drying of lumber. Both are essential for satisfactory results; heat to evaporate the moisture, to hasten its movement to the surface of the boards, and, in many kilns, to induce circulation; circulation to distribute the heat, carry the warm, comparatively dry air through the piles and to carry off the moisture-laden air. To ensure an even distribution of heat and even drying, the circulation should be the same in all parts of the kiln.

It has been stated by many authorities that the speed with which lumber may be dried is limited by the rate at which the moisture moves from the centre of the lumber to its surface. Heat hastens the rate of transfusion, but it stands to reason that it cannot be evaporated from the surface faster than it moves outward. Another feature that retards drying is uneven distribution of heat and uneven circulation. While the moisture may be eliminated as fast as it is carried to the surface, the rate of drying or rather the drying period is largely controlled by the rapidity with which the stock dries in the coolest spot or where the circulation is most sluggish. It is doubtful if an even distribution of heat is secured without an active circulation, which would lead to the conclusion that the drying period is in many instances unduly prolonged because the air movement is not sufficient to ensure rapid, uniform drying.

Securing Greater Uniformity.

The relative humidity of the air governs the rate of evaporation, irrespective of the rate at which the air is moving. On first thoughts one would likely jump to the conclusion that by increasing the rapidity of the circulation, the drying speed would be increased in proportion. This is where the humidity plays its part. Regardless of the rate of circulation air at a certain temperature and containing a fixed percentage of relative humidity can only absorb a certain limited quantity of moisture, and is not capable of drying the stock below a certain fixed percentage of moisture content That being so, what advantage accrues from maintaining a lively circulation?

Let us consider the progressive type kiln for a moment. The lumber enters at the green end and is then moved step by step until it reaches the dry end and is ready to be taken out. The difference in the relative humidity between the green and dry ends of the kiln is due to the fact that the warm, dry air enters at the dry end and as it progresses toward the outlets at the green end it is continually picking up moisture from the lumber, with the result that by the time it reaches the green end it contains nearly all the moisture that it is capable of holding, with the result that drying at this end is retarded. It will readily be seen that by increasing the circulation in a progressive kiln, the aid would not contain as high a percentage of relative humidity when it reached the green end as with a slower air movement, and as a consequence the stock at the green end would be dried with greater rapidity. By increasing the circulation still further a point could be reached where the stock at both ends would dry at practically the same rate, or in other words, the lumber would be dried at a uniform rate from end to end of the kiln.

Shortens Drying Period.

The same holds true, to a lesser degree, of course, in the case of each individual truck-load in either a compartment or progressive type kiln. Unless the movement of air is sufficiently rapid, the section of the load through which the warm air enters will dry faster than the section through which it leaves the pile As drying must be carried on until all the stock is uniformly dry, the drying period is really governed or controlled by the rate at which the lumber dries at the points where the drying is slowest. Thus, if the circulation is not rapid enough to enable the lumber in any pile to dry evenly, the drying period is unnecessarily prolonged. This is also the reason why the arrangement of flues and ducts must be such that the circulation is uniform in all parts of the kiln. Should it be slow or sluggish in any section, the drying in that particular part of the kiln will be retarded, necessitating a longer drying period. It will then be seen that it is absolutely necessary that an adequate circulation be uniformly maintained in all parts of the kiln. When that obtains, the rate of drying may be controlled by the humidity of the air.

To outline what constitutes an adequate circulation is not an easy matter. It is all well enough to say that a circulation that carries off all moisture at a uniform rate from all parts of the kiln as fast as it reaches the surface of the stock, is an adequate circulation, but to define it in terms of cycles or volume of air movement is another matter. Some manufacturers of dry kilns claim they can maintain an adequate circulation by natural methods simply through the number, size and arrangement of flues and air ducts, while others resort to mechanical means either through the use of a fan or blower or by means of a water spray or a condensing

coil to accelerate the air movement. One kiln manufacturer claims to change the air in his kiln three times a minute and as a result is able to shorten the drying period by 50 per sent.; not because rate of drying is increased, but because the slow sections, which length ened the drying period, have been corrected or eliminated by the increased circulation.

It might be a good suggestion for every kiln operat:or to check up the circulation in his kilns (a simple method was outlined on page 98 of the March, 1921, Canadian Woodworker.—The Editor) and locate the places where the circulation is slow and then take the steps necessary to overcome this sluggishness. If that were to be done, the drying period might be reduced, increasing the productivity of the kilns and lowering kiln-drying costs, without increasing the tendency to casharden or check or without pushing the drying operation beyond the limit of safety to the stock.

Foreman Relation to Modern Industry

Has Assumed New and Important Duties — Forms Connecting Link Between Management and Men — Must Meet Latter on Footing of Equality.

By R. J. Waldo.

Modern manufacturing methods and their rapid progress towards specialization demands now more than ever before that foremen be selected with exactness equal to any other executive position in modern industry. It has been only within the last few years that the foreman has come forward and proved that the place he held was one of sufficient importance to class him as an executive and to command equal hearing of other department heads.

The foreman of the earlier days was simply a man who hired, fired and directed his work as best he could, considering the amount of time he was required to spend away from his department, especially upon Monday morning. The foreman of to-day remains in his place and personally supervises the entire workings of his department at all times. When he has need for a new man he makes requisition upon the employment department or the superintendent who is responsible for all the hiring, while he keeps in close touch with his men and hold production to its maximum.

Some of the Duties of the Foreman.

Let it first be understood that the foreman, if he is to be successful, must be capable of varied duties. He must be broad-minded enough to see all the factors interrelated with his work. He must be thoroughly conversant with his duties and not overstep another department head.

The present-day foreman usually has assigned for his aid a capable assistant, who relieves him of a great many of his minor duties, leaving his time to be used in the accomplishment of his greater tasks.

Previously all material which was used in his department was checked by him personally to be certain that it was the proper material for use. Now it is checked and carefully placed in the stock-room for use as ordered. Former methods held him strictly to overseeing the actual manufacturing operations. Now, with modern methods of inspection, he is relieved of much of this by the floor inspectors, who continually gauge finished material at the machines. This proves far easier with the automatic machinery now being used with their gauges and automatic control of tools. Formerly he personally kept the order department posted upon the condition of finished material coming through. Now this is attended to by the production clerks, who are a part of the department.

One condition which has not changed is, when a man wants a raise in wages he goes to the foreman and asks for it. To handle these cases in a fair manner and one which is satisfactory to both employee and employer the foreman must possess a sense of judgment in such matters so that he will be ever willing to see a man give the worth for his wages as well as get an ample reward for his service.

If the foreman feels that the man asking for more money is not worth more he must be able to tactfully inform him that he is not at that time worth more and leave the man with a feeling that he is being fairly treated. This takes a sort of tack hard to find in the majority of foremen. If this is not done in a satisfactory manner the man will feel that he is unjustly treated and will leave. This sort of leaving adds unnecessary expense to the production cost. The man has been trained in the special methods of the company, and it is up to the foreman to hold him as long as he can and prevent repetition of this training cost factor, if possible.

Called to Settle Grievances.

The foreman is called into a delicate task when the worker cannot agree with the man next to him, or has had some misunderstanding with an employee in the department. Usually both men threaten to leave, and unless properly handled they will leave. In the larger corporations the man is sent to the director of personnel and there the grievance is settled. However, in the smaller plant the foreman is the meditator and in dealing with this certain function he must possess a diplomatic manner which will bring both men to realize that he is willing to meet them fairly.

Perhaps another employee feels that some employee of the department is being promoted faster than another. The latter often complains. It is the tactful foreman who is able to show the man who complains that the one promoted has been preparing himself for the better place and because of his perseverance in his study is being rewarded. Again, if the foreman is the true type of executive he will at the same time encourage the latter man, suggesting that he, too, can prepare himself for a better place if he will but sacrifice some of his pleasure for study.

Supervize Piece-work Rates.

In shops where payment of wages is made by the piece rate method it often occurs that one man will receive by accident pieces which make for him a most desirable wage. As these orders are handled by the dispatch dpartment, and not by the employees of the department, employees often feel that some one other employee is being treated better than themselves. No

foreman can handle this sort of a grievance in an unthoughtful manner. To the contrary, he must be willing to explain how it is actually handled and be certain that the men understand it.

Being a pal or one of the men is a most important part of the foremen's duties. I know of no better way to illustrate my point than to cite two striking instances which are in contrast. Some time ago I was passing through one of the most modern plants making phonograph bodies. The men were on piece-work schedule and a lad was employed to take material from the stock-room to the men. While standing near the stock-room the foreman called to the lad and informed him "Number 68 wants a pot or glue." However, the lad immediately responded. Little was thought about this until about two weeks later while passing through a chair factory I overhead a foreman instruct the stock mover: "Oh, Bill, take that load of side pieces down to Jack. He is about out." This coming from a foreman in a plant less modern than the first one mentioned, was a striking contrast to the later. However, the spirit of friendliness shown in calling a man by his name rather than by a number appeals to men and makes them work better and beyond doubt harder. Numbering a man seems to make him mechanical. The modern foreman will learn the name of every man in his department as soon as he can do so and to his advantage.

Must Have Their Confidence.

He will not only be one of his men, but will be willing and expect to leave by the same door as his workers. The writer has personally seen foremen who have left the shop by a separate door. This is not, however, the method used by the successful foreman of the present day. Certain corporations who have installed lunch rooms for their men who have set aside tables for use of their foremen. These things are noticed by the workers, and if he will obtain their maximum production he must be one of them and mingle freely with them.

In contrast to the foregoing the writer has seen foremen spending the evening with his workers and joking as freely with them as some foremen would joke with their superiors if they could. I have seen foremen take a chew of tobacco out of a workman's package and have seen workmen have a chew offered them by their foreman. These things, while not applicable to in the sense given by all, yet the fundamental principle is the thing I wish to bring out.

(Continued in September issue.)

Wood Separators for Storage Batteries

Canadian Woodworkers turning their attention to Battery Separators—Preference being given to United States Manufacturers—Outline of Various Operations

The manufacture of wood separators for electric storage batteries is an industry that has had a remarkable growth in the United States during the last few years. These pieces are used in many makes of storage batteries to separate and insulate the battery plates. Naturally with the growth of the automotive industry and the increasing demand from other sources for storage batteries, the market for separators has increased in proportion. Nor has the limit been reached.

In Canada the same does not hold true. While there are one or two woodworkers manufacturing this line, they do not receive the support they should from the manufacturers and distributors of storage batteries in this country. It is estimated that from fifteen to thirty million wood separators are used in Canada each year, yet only a very small proportion of these, a negligible quantity, is the product of Canadian plants. The reason for this is not that Canadian separators cannot be made as good or as cheaply as the American article, but rather that the largest users of separators in Canada are branches of United States houses, and they buy from their American organizations, even when the Canadian product can be secured for a lower figure. Some of them have even gone a step further. The service stations, which are located in various centres throughout Canada, utilize a large number of separators each year for repair work. These stations, which are strictly Canadian, were showing a preference for the home-manufactured product. This did not please those in charge of the larger battery houses (Canadian branches of American firms), who threatened to cancel their agencies unless the separators used were purchased from them, which meant unless American separators were used. This seems to be a short-sighted policy. These Canadian branches are selling in Canada to Canadians and should favor a Canadian product wherever possible, price and other things being equal.

Require Skilful Handling.

A glance at the accompanying sketch will give an idea of what the separator is like. The size and thickness will vary according to the make of battery for which they are intended, but 4 x 5 x 3-32 may be taken as average dimensions. They are grooved on one side as shown. Many different woods are used, though cedars, such as Port Oxford, B. C. red, B. C. yellow, and Ontario cedar, together with basswood, seem to be prime favorites. Other woods used include redwood, cypress, cherry, poplar, and Douglas fir. The wood must be light, porous, not too soft, of good insulating qualities, and highly resistant to the acid with which the battery is filled. It is this latter quality that makes cedar such a favorite.

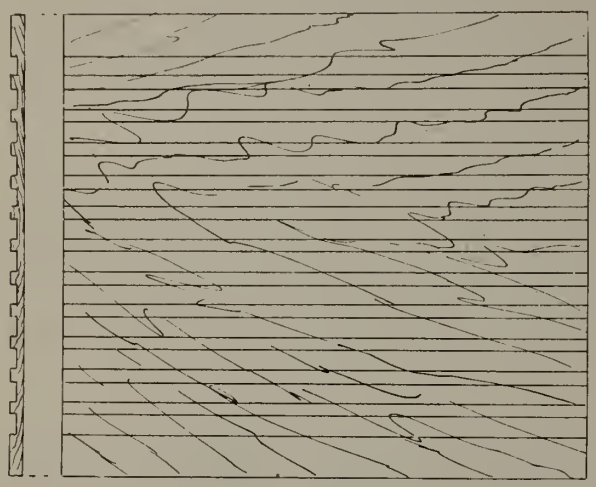
Naturally, the machining of such a thin, fragile piece of wood is a ticklish job. The stock is worked up in the rough to a suitable size, the splitting or resawing being usually done on a band or very thin circular resaw. It is not unusual to get seven pieces from an inch. In some batteries, rotary cut veneer stock is used, but the sawn material makes the best separator. The material should not be too dry, otherwise the loss from broken and split pieces will run high. About 12 or 15 per cent. moisture content is the best. After resawing to thickness, the planing and grooving is done on a moulder.

Special Attention to Machine

The bed of this machine must be smooth and true and all the openings filled up. Both upper and lower feed rools should be adjusted very fine with little or

no lead. It might be advisable to fill the space between the upper rolls with wood blocking. The same applies to the space between the rolls and chip-breaker. This latter should be faced with hardwood and set as close to the cutter head as possible.

Special milled cutters are usually employed for making the grooves. These are set the reverse of the usual way so as to secure a scraping cut. Some advocate a set of milling cutters or saws for this purpose, every second saw being smaller in diameter



Sketch showing details of Wood Separator.

than the one on either side, the difference corresponding to the depth of the groove. More cutting edges would be secured and the saws could be set staggered, breaking up the cut.

The side heads, when used, are fitted with ordinary cutters. Some advocate running one of the heads backward, preferably the outside one, so that the stock may be grained. The same idea is sometimes applied to the top head. All cutters or knives should be joined and maintained in a sharp, keen cutting condition.

The shoes and guides must be set close to the work, but not tight enough to bind. Feeding thin stock like this, if there is any binding or resistance, a lot of trouble will be experienced from breakages.

Pieces Chemically Treated

After the stock comes from the sticker, it is cut to length, a clipper knife doing the trick, and then sorted or graded. The pieces are then boiled for a number of hours in caustic soda, to remove all resins, acids, and other wood impurities, and then washed in a weak acid solution. From now on the pieces are not allowed to dry out, but are packed in airtight packages, usually with waxed paper, and kept that way until required.

There is a demand for both treated and untreated separators, as some battery manufacturers prefer to treat their own stock. The price varies, depending on the size of the separator and the quantity purchased. It runs all the way from $15 to $35 per thousand.

If all the Canadian business could be secured by local concerns, it would amount to a nice sum. Putting it conservatively, say the requirements are 15 million annually at $20 a thousand, the volume of business would amount to $300,000 or more a year. At the present time at least two companies are working on this proposition, but as intimatd they have not succeeded in persuading the larger manufacturers to use a Canadian product.

Electric versus Belt Transmission

Interesting discussion of both types of drive—Efficiency of each drive compared—How poorly designed belt drives waste power—Hints for aligning shafting

By W. F. Schaphorst, M. E.

(In this discussion Mr. Schaphorst deals mainly with plants which generate their own electric current. The majority of the woodworking plants in Canada using the electric drive, purchase their power, usually at very favorable rates, paying only for the amount of current passing through the meters. That being the case, the efficiency of the generators may be rated as practically 100 per cent., under the assumption that about all the power paid for is delivered to the motors, i.e., that there is no transmission loss between meters and motors. Where this holds true, there is only the efficiency of the motors themselves to consider, and from the figures given in this article, the average motor efficiency is satisfactorily high.—The Editor.)

Many woodworking plants have already installed electric power, and they say it is good. They say that it is more economical than belt transmission and that they are "going to stick to it."

The writer has always been an advocate of belt transmission in the woodworking plant as regards efficiency of transmission and power consumption, and he will not change his opinion until generators and motors of the smaller sizes are made more efficient. It is true that electric transmission, individual drives, and even group drives, "look" better. The electrically-driven shop usually has a cleaner appearance. There is no overhead belting to cut off the light, to take up space, to slip and squeal, to run off, or to require periodic attention. All of these things are admitted.

In the electrical transmission of power we always have at least two efficiencies to consider—the efficiency of the generator and the efficiency of the motor. Where the distance between generator and motor is great the line efficiency also must be considered, but in most woodworking shops using electric power distribution the line efficiency is so nearly 100 per cent. that it can be neglected.

Conditions Control Type of Drive

Herewith is a small chart prepared by the writer which gives the "combined efficiency" of the generator and motor. The line efficiency is assumed to be 100 per cent., and is therefore neglected. For example, to use the chart, if the efficiency of the generator is 91 per cent., and of the motor 79 per cent., the dotted line across the chart shows the combined efficiency to be 72 per cent. The chart will figure any combination where the efficiency of either generator or motor is over 50 per cent.

One of the many mooted questions is: Which is better—electric or belt transmission? The correct answer is: "It all depends upon conditions." The

object of this chart, therefore, is to help you answer the question for yourself.

With ball bearings and low belt tensions, the efficiency of belts and shafts may reach a very high figure—98 per cent. and even over. That is a point that must be taken up with the manufacturer. But if it is made certain that belt transmission will provide even 80 per cent. efficiency, that, in most cases, would eliminate the electric drive, although, of course, efficiency is not the only thing to be considered.

To assist users of the chart, I give these average efficiencies of generators and motors at full load: Direct current generators—50 kw, 90 per cent.; 100 kw, 91 per cent.; 1000 kw, 93 per cent. Motors—¾ h.p., 64 per cent.; 5 h.p., 80 per cent.; 15 h.p., 84

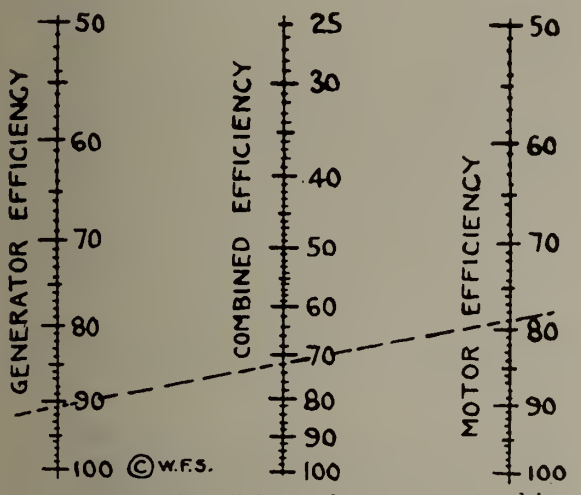


Chart for calculating efficiency of motor-generator drive.

per cent.; 30 h.p., 90 per cent.; 150 h.p., 92 per cent. Alternating current generators—50 kva, 90 per cent.; 100 kva, 91.5 per cent.; 500 kva, 94.5 per cent.; 1000 kva and over, 95 per cent. Motors—1 h.p., 76 per cent.; 10 h.p., 85 per cent.; 100 h.p., 90 per cent.; 200 h.p., 92 per cent.

How Power Is Often Lost

If belts are not properly cared for; if shafting is not carefully aligned; if belt tensions are maintained too high; if much belt slip is permitted; if the oil can is not used regularly; if the bearings are not kept clean; and if the bearings are not babbited when they need it—and this is the way belt transmissions are too frequently operated—then, under such poor conditions, the writer recommends electric drive. The upkeep of electric drive is less expensive. The first cost is greater. The efficiency does not become worse so quickly as with poorly kept and poorly operated belt drives. However, as already stated, by being careful one can often get more out of belt drive than out of electric drive.

One of the things that the operator of the woodworking plant should guard against is—belt trains. Belt trains are a bad thing. Not long ago I was in a plant where a steam engine drove a main shaft by means of a belt, the shaft running through a wall and carrying power into an adjoining room. It was a plain shaft, poorly aligned. The belt was tight and yet it slipped. It was a good example of a poor belt drive. The efficiency of that drive was, say, 80 per cent. From that shaft a second lineshaft was driven, the efficiency of which was, say, 80 per cent. A third shaft near the floor was driven from this second line shaft. We will again call the efficiency of that drive 80 per cent. Then came a belt twist for the purpose of turning shafting that was hung at right angles to the first shafting. The efficiency of this quarter-turn drive was, say, another 80 per cent. The power was then carried to another line shaft, and so on to the farthermost end of the room. I did not count the number of belt trains, but am sure there were at least eight and perhaps ten of them. In all my experience with belts, I do not remember seeing as glaring an example of wasted power through belts as I saw in this plant.

Assuming the efficiency of each unit drive to be 80 per, and that the number of units or trains is ten, we must multiply 0.80 by itself ten times as follows: 0.80 x 0.80 x 0.80 x 0.80 x 0.80 x 0.80 x 0.80 x 0.80 x 0.80 x ∪.80—0.107. In other words, the overall efficiency of the drive from end to end is less than 11 per cent., which is surely too low an efficiency to sanction, these days. One of the machines driven by the sixth train required about 20-horse power for its propulsion. After six trains it is easy to compute the efficiency of the transmission line to be about 25 per cent. The power generated by the engine to drive this machine was therefore: 20 divided by 0.25 equal 80 h.p. power.

Securing Greater Efficiency

Now, if a rope drive had been installed from the engine direct to this machine it would have been possible to negotiate the turn through 90 degrees and yet attain a much higher efficiency than 25 per cent. Let us assume that an efficiency of 80 per cent. could be effected with a rope drive of this kind. The power required of the engine would therefore be only 20 divided by 0.80 equal 25-horse power. In other words, the power saving would be 80-h.p. minus 25-h.p. equal 55-h.p.

Another way to surmount this evil is to install electric group drives. Let the engine drive a generator and then distribute the current to motors scattered her and there over the plant. The efficiency of the generator should be at at least 90 per cent. and the motor the same. The overall efficiency of the electric drive will, therefore, be very close to 80 per cent. From one of these motors one can therefore run a belt and get a high ratio to the driven machine.

Belt trains aren't so "terrible" where the machines driven at the end do not consume much power. But where the machine uses as much as the above machinery required, it is good engineering to get the power to the machine more efficiently—by a more direct route—mechanically or electrically. I usually advise using the mechanical method.

Suggestions for Aligning Shafting

To keep shafting aligned, one very good method is the "steel wire method." Stretch a wire from one end of the line shaft to the other, just beneath the line shaft. Then, by means of a plumb bob suspended from the shaft at various points, it becomes possible to align the shafting with great accuracy—horizontally—within 1-64 of an inch. To align the shafting vertically, a rubber hose, with a gauge glass inserted into each end, will serve the purpose very well. Fill the hose with water, maintain the level at a certain point at one end of the shaft, and then by moving the other end of the hose to the point to be leveled the proper elevation is easily determined.

How One Plant Increased Production

One of the interesting features in the plant of Lyon Bros. Toronto manufacturers of wood boxes for storage batteries, is the use of what is known as the " recessed head screw." These screws, which differ frrom the ordinary type in that there is a square recess in the head instead of the usual slot, can be driven with greater rapidity, and the driver is not liable to slip as is the case with the slotted-head screw. In this particular instance a Reynolds automatic screw-driving machine is used for sending these screws home. The accompanying illustration shows this machine in operation, with Mr. Lyons in charge. Mr. Lyons was quite enthusiastic with regard to the many advantages of the recessed head. The square on the driver fitting snugly into the head, enables the screw to be driven

Robertson recessed head screws being driven in battery boxes by Reynolds automatic screw driving machine.

straight and true, and the trouble experienced from slotted head screws splitting, is entirely absent. He says that its use has resulted in a marked increase in production.

An advertisement of Recessed Screws, Limited, Manchester, England, which appeared in a recent issue of the " London Daily Mail," gave an interesting outline of the development of wood screws. The earliest screw know was said to have been invented by Archimedes, 250 years B. C. As turning machines or lathes were not known at this date, the thread was formed by wrapping brass wire around the body of the screw. This was a blunt of square pointed screw and had a round head with a hole in it. It was driven by inserting a pin in the hole and thus revolving the screw. In 1775 an English inventor brought out what is coninserting a pin in the hole and thus revolving the screw like its ancient prototype, this also had the blunt point. It was not until 1850 that the modern or gimlet-pointed screw first came into use. Naturally the Recessed Screws, Limited claim that the latest development is their recessed head screw.

P. L. Robertson Mfg. Co., of Milton, Ont., who have the Canadian rights for this recessed screw, find that there is an ever increasing demand for this article. It is finding favour in many directions, being used in the furniture, woodworking and auto body manufacturing industries, and is used to a considerable extent in the electrical field. The appearance of the finished product is more attractive than where the old slotted-head type is employed. The claims put forward with regard to the use of this screw are that double the amount of work can be produced and that the quality and appearance of the article is improved.

The Trend of Wages During 669 Years

The table below was compiled from information gathered from the continuous record of accounts relating to the work on buildings in London for more than seven centuries, ome of which are Westminster Abbey, Westminster Palace, the Tower of London, Hampton Court, Whitehall, and Buckingham Palace.

It is claimed by the compiler (The Times, London, Aug. 31, 1920) that the lesson taught by this investigation is that wages when they have once risen never decline.

Testing Strength and Serviceability of Boxes

Outline of Methods followed in Testing Boxes for carrying Macaroni and Similar Products — Indicating how Strength could be Increased.

By Don L. Quinn, Resarch Dept. Chicago Mill & Lumber Co., Chicago.

A number of the Consolidated Classification Committee sent a request to the National Association of Macaroni Manufacturers, asking that specifications be submitted covering a box suitable for packing macaroni and similar products, which would tend to reduce the transportation losses. To this end, a series of tests were made to determine the reason of the failure of so many boxes while in transit, and to prepare specifications that would ensure a box sufficiently strong to withstand ordinary handling and transportation hazards.

The tests were made in the box testing laboratory of the Chicago Mill and Lumber Company in Chicago, with the object of measuring the strength of wood boxes used for carrying bulk macaroni as compared with wood boxes used for carrying other commodities, and to measure the value of different thicknesses of lumber in comparison with each other. Investigation of those boxes was also made in macaroni plants and in transpotration in order to confirm the laboratory conclusions.

Method of Testing

Two methods of testing these boxes were followed—the compression test and the revolving drum test.

A compression test is, as its name implies, a constant and steady increase of pressure measured in pounds applied to one corner or edge of an empty box, with the opposite corner or edge, diagonally through the box, in a direct line with the pressure exerted. The amount of pressure required to collapse the box is the measure of its strength against such hazards of transportation as could cause such failures. For instance, the box in the bottom row of a pile in a moving, swaying, jerking freight car is subjected to just such strains.

In the drum test, on the other hand, the box was packed with bulk macaroni, just as in actual service. The drum has six sides and slowly revolves. Inside the drum are hazards so arranged that, as the drum revolves, the box is made to fall in a more or less regular cycle on ends, sides, top and bottom; on corners and on edges until it breaks up and spills the contents.

The number of falls the box withstands before it fails and lets its contents out, is the measure of the strength when subjected to rough handling. Necessarily, if one kind of box will withstand fifty falls before breaking up, and another will withstand one hundred similar falls, it follows that the latter is twice as strong in so far as carrying that particular commodity is concerned.

These two tests permit an exact comparison of the serviceability of boxes of different specifications. Studies made under actual transportation conditions confirm these conclusions, for boxes fail in actual service in exactly the same way they fail in these tests.

Discussion of Compression Test

In the compression tests, three series of tests were made, ten boxes in each series. The lightest boxes in common use, having 7-16-inch ends, and ¼-inch veneer sides, tops and bottoms, made of gum wood, were tested first. They were nailed in accordance with the nailing schedule compiled after a long series of tests in the Foerst Products Laboratory of the U. S. Forest Service and officially adopted by the National Association of Box Manufacturers as their standard. It required 387 pounds under diagonal compression to cause these boxes to collapse. (I will explain a little later the significance of these figures.) The typical failure was in the splitting of the ends, which means that the ends were not as strong in resisting compression as the quarter-inch sides, tops and bottoms.

Ten boxes, having the same 7-16-inch ends and ¼-inch tops and bottoms, but with 5-16-inch instead of ¼-inch sides, were then tested. It required an average of 430 pounds to crush these. The heavier sides evidently tended to reinforce the thin ends of these boxes. These were 11 per cent. stronger than those tested in the first series. In this second series, as in the first, the typical failure was splitting of the ends.

In the third series, ten boxes having ½-inch gum wood ends and ¼-inch sides, tops and bottoms, were tested and then withstood an average 502 pounds before collapsing—30 per cent. stronger than those of the first series. In this series, as in the other two, the typical failure was in the splitting of the ends. In other words, the ¼-inch veneer sides, tops and bottoms were, in most of the 30 boxes, in good condition at the time the ends split.

Increasing the thickness of the ends from 7-16-inch to ½-inch added only 30 per cent. strength—not enough, in fact, to justify a change to that construction. If additional strength be necessary, the thickness of the ends would have to be increased beyond ½-inch, if any materially increased serviceability were to result.

We contend an average of 387 pounds in diagonal compressive strength is a great deal more than those boxes need in service. Other tests show that a box which will resist approximately 400 pounds in diagonal compression requires that at least 1,200 pounds be piled directly on it, and then be subjected to stresses similar to those it would get in a pile in a jerking freight car before it would collapse. That is at least three times as much weight as macaroni boxes could reasonably be expected to carry when loaded in car lots, and certainly is as much weight as should ever be piled on them in a local freight car if the railroad employees use any judgment whatever.

Discussion of the Drum Test

The boxes tested in the revolving drum corroborated the result of the compression tests. These boxes were made of 7-16-inch ends and ¼-inch veneer sides, tops and bottoms of gum wood. We used standard egg case nails, because of their large heads. These nails, in length, are 3d size. Each box held 22 pounds of bulk macaroni. They averaged 31 falls before breaking up and spilling their contents.

Now, 31 falls in that big iron drum machine are a great many falls. For instance, we have tested hundreds of canned food cases of the best construction

in common use, and their average, under the same falls, is much less than 30. We have tested hundreds of cases such as are in common use for carrying other similar commodities, and in the same machine they average less than ten falls before breaking up —one-third the serviceability of these light macaroni boxes. Many other tests of a similar nature on varying products gave us other data with which to compare these results, and upon which to base our judgment as to the proper measure of serviceability.

But you ask: If that be a true measure of their strength, why the complaint from the railroads? The reason was plain enough when we investigated the boxes in the plants of macaroni manufacturers. We found that a great many boxes were made of mis-cut parts. The most common fault was ends cut from 1/4 to 3/8 of an inch too narrow or else they had been made of green lumber and shrunk that much. We found ends that were of the correct width at one end and 3/8 of an ich scant width at the other. When nailed up, the sides extended beyond the edge of the ends, so that when the top or bottom was nailed on, that caused the top or bottom to split at that edge. Veneer is frequently cross-grained, so under rough handling, that split immediately extends across the board, lets a part come loose and the macaroni falls out. Without doubt, that was responsible for more loss and damage claims than any other single cause. Of course, the fault lies with the box manufacturer. It is his duty and obligation to furnish the material cut true to size and proportion. Under the usual conditions of manufacture, he meets that responsibility to the fullest extent—at least the thoroughly reliable box manufacturer does.

The other glaring fault we found in macaroni plants was the naiilng. Sometimes the right number of nails were used, but they varied in size from 3d to 5d. The 4d and 5d nails are too large. They start a split in the ends before the boxes are packed. The heads of the 3d nails are too small. They have very little grip on the material under the nail head. I suspect this nailing was responsible for more loss and damage claims, under normal conditions, than any other single cause, and was second in importance under the abnormal conditions of the past few years.

Lesson to Be Learned

The conclusions are obvious. The box manufacturer is in duty bound to furnish you with properly cut materials. He sells you such, and he expects to make that delivery. It costs you no more to get properly cut materials under normal conditions, and normal conditions of manufacture now prevail. Of course, it is your duty to demand good material and then to see that you get what you demand. It is your obligation to nail right. The manufacturer may furnish the highest grade material, but unless the parts are well nailed the box is not good. By nailing right, we mean to use the right number and the right size nails. We recommend the standard egg case nail, because of its large head. It is standard 3d in length and gauge and has a head equal to a 5d box nail. The nails should be spaced 1 3/4 inches to 2 inches apart; the closer the nails are spaced the greater the serviceability of the boxes. The large head gets a good firm hold on the thin boards on the sides, tops and bottoms, and that counts for much in holding those parts together. These nails are a standard manufacture; are listed at 15c per keg advance over 3d nails, are cement coated, and there are more nails per keg. They can be procured from the usual sources of supply.

These two factors, together with the more normal transportation conditions, should give boxes of proper serviceability. They should satisfy the railroad people. No necessity exists for specifying wood boxes of any stronger construction than is in common use to-day. They have ample strength for usual transportation conditions, and they have enough additional strength as a factor of safety to satisfy any reasonable requirements.

Manufacturers of macaroni, who use wood boxes, certainly have little cause for complaint because of these obligations. All that is necessary is that they exercise the proper degree of supervision over the quality of the box materials they buy, and then see that those materials are nailed together properly. It certainly is a light responsibility. Think how bothersome it would be if you were packing Mazda lamps, for instance, where the value of each item is big, and the liability of damage is in the delicate filaments. That responsibility was met and overcome by the manufacturers of those lamps through laboratory tests and studies, similar in every respect to those I have described.

Going to the opposite extreme, the manufacturers of computing scales were confronted with the necessity of protecting frail castings and delicate agate bearings and sharp knife edges. They met that responsibility likewise through similar box laboratory tests and studies, and are assuming that responsibility, and reducing their loss and damage claims accordingly.

Loss and damage claims paid by the railroads jumped in four years from about 35 million dollars per year to about 110 million dollars. A necessity exists for reducing those rapidly mounting claims, and each of us, the box manufacturers, the shipper, and the carrier, has his share in that responsibility. Neither one alone can do it all. Each has a part to perform. Their interests are not antagonistic, they are very much interwoven. Working together, doing his part, assuming each his own fair share of responsibility, those claims will be rapidly reduced, and all will be better off because of it.

Gas Being Made from Wood instead of Coal

Gas made from old oak logs is now being supplied successfully to the inhabitants of Steyning, a town in the county of Sussex, England. Other towns are rapidly following suit. It is claimed that this wood gas has practically the same heating and lighting properties as coal gas, and its use means a saving of more than half a dollar per 1,000 cubic feet to the customer.

The Steyning gas works being threatened with closure owing to the prohibitive price of coal, about $25.00 a ton, the carbonization of wood was resorted to as an experiment, with the result that wood gas has been definitely adopted as an illuminant until the price of coal comes down.

At Birmingham, old road paving blocks have been converted into wood gas with equally satisfactory results.

It is better to run a wide belt very loose than a narrow one very tight. The first is easy on the bearings, and the second wears them out in record time.

Upholstering and Trimming

Modern Upholstering

Successive Steps in Building up Foundation for Soft, Downy Upholstering. Special Methods Followed in Modern Practice

(Continued from July Issue)

The next step is the formation of the nosing, which may be made in two ways. When referred to as a " nosing," it means simply that a roll is built up on the rail itself, as in cross-section Fig. 8-A; when it extends back to a point even with the springs, we will refer to it as an " edge."

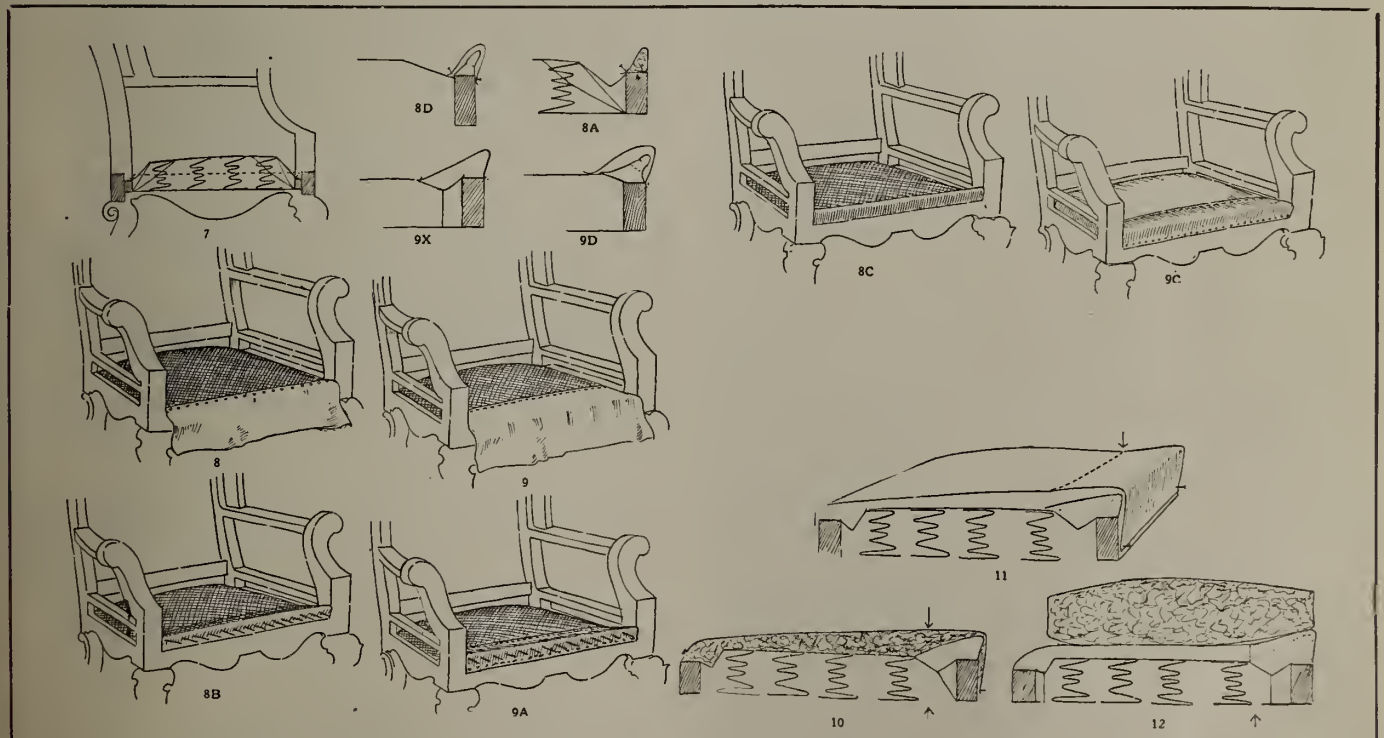
Fig. 8 shows the first step in forming the nosing. A strip of canton flannel is back-tacked to the front of the rail. This strip is filled uniformly with hair so as to produce a fairly compact roll, and the back edge is tacked to the back of the rail, as indicated in Fig. 8-A, a cross-section sketch. This nosing is given a single straight stitch after the manner of a regular stitched edge. See Fig. 8-B. When the canton flannel is carried back onto the springs, it is stitched to the spring canvas, as indicated by Fig. 9. This is stuffed into a regular edge, but kept low, and shaped to about 1½ inches high in front, as shown in the cross-section Fig. 9-X. The stitched appearance of this edge is illustrated in Fig. 9-A, while Fig. 8-B shows the stitched appearance of a nosing, the front view really appearing very little different, except that the nosing, being low, requires practically a straight stitch.

Covering the Nosing

The next step in the treatment of the seat is to cover the nosing with a layer of hair. Another strip of canton flannel is back-tacked to the top of the front rail, and carried back and tacked, if a nosing, or stitched, if an edge, so as to make the finished foundation, as illustrated in Fig. 9-C and cross-section 9-X(the stitched edge, covered, and Fig. 8-C and cross-section 8-D, the nosing covered.

A light layer of hair is now placed over the spring canvas, and a covering of muslin is drawn over this hair pad and slip-tacked into position, the cross-section of the chair appearing like Fig. 10. Then, at a distance of about three to four inches from the front edge, a line is drawn on the muslin, as indicated in this figure by an arrow, and on this line the filling and muslin are stitched through and through. (See Fig. 11.)

It should be borne in mind that the object of the nosing or stitched edge, and the stitching of the muslin, which we have just described, is all to provide a base which will allow for the ultimate shape of the down cushion, which is always thicker in the middle than at the edge, and the foundation must be made concave to allow for the convexity of the cushion. This is best explained by a reference to Fig. 12,



Details for building seat foundation

Successive Steps in preparing Back

which shows the cross-section and contour of the muslin foundation and the cross-section of the down cushion.

After the muslin has been stitched down, as indicated by the arrow on Fig. 11, the edges are tacked all around and the foundation is finished, ready for the covering.

The seat of the chair, having reached the stage where it is in muslin, is preferably left in this condition while the balance of the chair is brought up to the muslin stage. The back is, therefore, next to be considered.

Springs for Soft Back

In connection with the chair under consideration, there are two ways of upholstering the back, either with springs, as shown in Fig. 15, or as a plain, softly upholstered pac-back without springs, which will be described a little later in connection with Figs. 29a and 29b.

To produce the softest form of back, it is necessary to use a foundation of springs, and these must be kept quite low, it being sometimes necessary to cut a pillow spring in half in order that the upholstering of the back shall not be too thick.

The first stages of the upholstering of the back of the chair we are describing are illustrated in Fig. 13. A thickness of canvas is stretched over the entire outside back and across this four strips of webbing are stretched and tacked, as indicated in the figure just mentioned. This provides a foundation for the springs, eighteen in number, which are placed as indicated by the crosses in Fig. 13, and by the circles in Fig. 14. The springs are sewn to the canvas by four stitches, preferably knotted as shown in Figs. 14a and 14b, after which they are tied down in the regular way, as shown in Fig. 15. A layer of canvas is next placed over the springs and tacked. The springs are sewn in this canvas covering also by four knotted stitches, as shown in Figs. 16 and 21a.

Building Up Edge

The next step, following the appearance of the chair in Fig. 16, is to provide the top edge of the back with a roll similar to the edge or nosing which has been placed on the front of the seat, described in earlier paragraphs. This edging is built up something like the nosing illustrated in Figs. 8a, 8b, 8c, and 8d, and is really a nosing, in that it is built up on the frame of the chair and is not sewn in the spring canvas. The flannel for this nosing is back-tacked on the top edge of the chair, as described for Fig. 8.

It is filled to a compact consistency with hair, tacked into position and stitched to form the shape indicated in Fig. 20 and in cross-section Fig. 20a. The reason for back-tacking the flannel which forms the nosing on the edge of the top rail is that allowance is thus automatically made for the swell of the curve, and fullness is disposed of.

The next step is the laying on of the hair covering, which may be done in either of two ways: by the bridling method, shown in Fig. 17a, and by the stitching method, shown in Fig. 17b. The bridling method consists, as will be observed in the figure mentioned, 17a, of having long stitches of twine

caught at intervals in the canvas, at a distance of about six inches from the outside edges of the back, also criss-crossed across the back.

Placing the Hair

The hair, already picked out so as to be free from lumps, is inserted beneath the twines in a compact mass, and woven together during the insertion by manipulating the fingers. (See Fig. 17c.) Over this another smooth layer of hair is worked into the first coating, so that the entire mass will be of the same thickness and consistency, after which a covering of muslin is drawn over and slip-tacked into position, as Fig. 18.

The other method of placing the hair, indicated in Fig. 17b, does away with the bridling twines. The hair is laid on the back to the required thickness and stitched through the canvas by long stitches which prevent the hair from slipping out of place. The softer the upholstering, the greater the necessity of the twines, which hold the first layers of hair in place, independent of the coverings.

After the muslin has been slip-tacked all around, as indicated in Fig. 18, it is again very carefully and permanently tacked, covering the wood frame of the chair if it is to be shown for display in muslin, but not necessarily so carefully covered if it is to be sold in the cover.

Fig. 21 shows a vertical cross-section of the back as completed in the muslin.

It is an old dodge to tie two thin boards on the overhead shafting to cool the surrounding air. Be sure they are secure and above a man's head.

Upholstering Springs

6½ cents per pound

Any Size, Height or Gauge

No charge for boxing or cartage

We make metal strips or supports with 2, 3 or 4 springs to the strip, any height, length or lifting power

Assembled constructions for Couches, Day Beds, Davenports, Chaise Lounges and Cloth Covered Loose Pillows.

D'Arcy Spring Company

Kalamazoo, Mich.

ZAPONITE is a wood lacquer

It's far removed from metal finish. We make finishes for both wood and metal and in recent years have studied furniture needs with a view of reducing costs through greater production. ¶ These years of experience have produced a wonderful Lacquer—ZAPONITE. ¶ It is easily applied and requires only a few minutes to dry. It gives a finish that is hard, durable and proof against dampness—one which induces economy and does not mar easily.

ZAPON

LACQUERS and ENAMELS

The Zapon Service Man will bring finishing experience right to your workroom and aid you in producing better merchandise and in obtaining greater production at lower costs.

Finishing Decorated Furniture

Demand for Decorated Furniture on Increase—Development of Enamel Finish—Requires Artistic Ability of High Order

To convey to the mind what is covered by the term "Decorated Furniture," it becomes obvious that we must cover enamel, enamel decorated, parchment, and polychrome furniture, says W. K. Schmidt, in the Furniture Manufacturer and Artisan. That the present day decorative work is a refinement of the heretofore enameled furniture can readily be understood. Enameled furniture was usually made with two undercoats, two coats of colored enamel put on in various harmonious shades with moulding trimmings, artificial carved decoration and usually rubbed finish. That beautiful results were obtained, we all know; that the extremes were modified, and that the decorations have passed through the ornate to the dignified. We still see real hand painted decorations in the shape of views, scenery, and figures, but mostly is the relief obtained by the decoration of the carving. This verges very much on polychrome in many cases. One might say a "modernized polychrome" effect.

All manners of ideas have been carried out on the mouldings, such as an undercoat of bronze, over which the color scheme has been worked and wiped off, permitting the bronze to show through the various portions of the moulding—the same as highlighting old ivory only getting brown tones in the recesses. The trimmed color being in the recesses brings decorated furniture to its present day standards and the work of quality is done by hand painted decorations which are laid under the finish and thus are protected against the rubbing and wear.

Very Attractive Results.

It is most difficult to produce a word picture that will correctly convey the beautiful results thus obtained. After a good ground coat has been produced—a perfectly smooth finish—the decorations are done by hand and consists in many cases of conventional designs, many of them of the Japanese theme, others of leaves and flowers. In many cases the top of a table will have a modeled parchment effect with an absolutelyplain off-set color in soft tones of blue or browns, harmonizing with the shades of the parchment. This parchment effect is produced in many ways. Imagine tiffany wall paper with its soft shades of brown rubbing into the lighter shades of orange, buffs and the like—one continuous wave of harmonizing colors without a definite design whatever. Then imagine this same color scheme done with a brownish black ground, but finished with a dull brown effect. It takes an artist to do it with a brush, but the clouding effect is easily produced with small spray. This same effect is carried out in any shade that the eye may conceive but always done in harmony. As stated this may be the border effect, or it may be the center effect. The center may be of a dull blue with a gold parchment border and again this parchment border may be decorated with design or flowers. Still another idea is to get what is known as an "autumn of brown"—brownish orange with leaf work on the table legs and chair legs, which again may carry a small decoration; but the one point that takes this modern day decorations away from its predecessors is the fact that the final finish is absolutely smooth and that the decorations are under this final fiinish, and hardly show a raised portion where the decorations are applied. This of course is accomplished in different ways, some using transparent shellac that has been clerified by filtering, and then rubbed flat or a thin, very transparent varnish, one that sets up well, gives a hard coat and will rub flat easily. Others prefer a wood lacquer, which gives the transparency desired and the finest film possible but assures a moisture proof surface, as well as a heat resisting coat. It requires experience, so as to avoid a disturbing of the hand decorations and still give an absolute transparent finsh which leaves the appearance of being a part of the entire finishing process. Finally the entire piece is rubbed dull.

Distinct from Polychrome.

It at once becomes necessary for those undertaking the manufacture of decorative furniture to maintain their designs in color schemes other than those of the polychrome style. We stated that many of them verged on the Japanese, this from the fact that in factories where Japs are doing the work, they are attempting to get American ideas into their decorative schemes In factories where Americans are employed it is presumed that they in turn get some of the Jap's ideas of decoration and thus it becomes a composite all the way through. Beautiful conventional designs are obtained from art journals, in which color plates appear and many of them have proven regular panaceas for the decorator who is always groping around for new ideas.

Another point the decorator of this kind of furniture should avoid is that of smutting his colors or designs. That would be conflicting with polychrome finish, and it is desirable to have both of these styles of decorative art go along on the distinctive lines rather than to be come ntermingled and thus lose their distinctiveness.

We have stated that the better grades of decorated furniture received a final coat of wood lacquer, and therefore we can say that as regards water resisting qualities, a lacquer film compares very favourably with out door spar varnsh. A panel to which three coats of lacquer were applied with spray, did not show a greater passage of moisture through the film by complete immersion in water over a period of ten days, than a similar test with spar varnish. Lacquer films show great resistance to heat. A film rubbed vigorously until heat unbearable to the touch will show no signs of gumming up. In this connection it might be stated that upon at least two days drying after the

final coat of lacquer the film is sufficiently hard as not to appear marked.

Suggestions to Follow.

The entire scheme of decorative furniture, one can readily see, carries with it the process or the art of enameling furniture to a more or less degree of perfection before decoration is undertaken. By enamels the furniture manufacturer as a rule understands a product whose vehicle consists of oils, varnish, and dryers of various kinds. We were fortunate in obtaining some technical notes on lacquer enamels which offer advantages and which will appeal to many owing to these advantageous qualities. Unlike the old style enamels they give a harder surface and results are obtained in a shorter time. Therefore the following pertinent facts are well worthy of consideration. The following being an extract from a laboratory report:

"For enamel finishes wood should be prepared by applying one or two coats of a combination filler and surfacer, the number of coats depending on the nature of the wood. For this work a lacquer pigmented surfacer is preferred over an oil surfacer for the following reasons: Has greater adhesion; presents a harder surface; can be applied and dried in three to four hours ready for enamel coat as against 20 to 30 hours for oil surfacer; being closely allied to lacquer, enamels require less enamel coats and enamel adheres better to it; no sealer is necessary over lacquer surfacer to serve as protection against action of enamel, the enamel tending to blister the oil surfacer.

"Oil surfacers are very soft and chalk readily. In deep groves they bridge when enamel is applied due to contraction of the enamel film and lack of adhesion of the surfacer. Oil surfacers can be used to advantage in end wood and pitted surfaces after which the lacquer surfacers should be applied.

"For spraying, lacquer surfacers should be thinned 30% using 50 pounds pressure.

"Oil surfacer, thinned 50 to 50 with 30 pounds pressure, for deep corners larger quantities of thinner should be used. After sanding for leveling and smoothing surfacer, enamel is applied. Enamel to be thinned 20 to 30% using 50 pounds pressure.

"Over lacquer surfacer only one or two coats of enamel are necessary, whereas two or three coats of enamel are necessary over oil surfacer, on account of the color and softness of the latter.

The first coat of enamel will attack the oil surfacer forming blisters which have to be sanded down. The second and third coats of enamel will insure a hard surface in case the oil surfacer is used. For the lacquer surface only a color surface is necessary. In case of flat enamels buffing is necessary for gloss if gloss is desired. Lustrous enamels can be used as a final coat to eliminate buffing. Time of drying between coats holds true with enamels same as with lacquers, two or three hours. Spray should be regulated and operated in the same manner.

"For metal parts oil surfacer is desirable for filling the pores and levelling off. Lacquer surfacer is too hard and brittle for this purpose, but can be used over the oil surfacer as a hardening coat and preparatory coat for enamel. Otherwise a sealer is necessary in some cases between surfacer and enamel coat to prevent enamel attacking surfacer.

"Very often an intermediate thin coat of shellac is necessary for adhesion to enamel. Other details for metal finish are the same as for wood."

We have not touched upon the kind of wood to employ. This is a matter entirely up to the manufacturer, but it is our conviction that in many cases not enough attention is given to the wood in the belief that enamel process covers a multitude of sins, and sins they truly become, where too soft woods are employed. The enameling process should always carry with it the idea of producing the finish so that the successive coats are bound thoroughly to the wood and will not chip off, for it is almost impossible to do a respectable repair job on faulty enameled work.

The Keeping Properties of Finishing Materials

Finishing products are manufactured on principles that require them to be used within a reasonable length of time. However, there are instances of varnish, etc., being kept for forty years and upon the container being opened, the contents were found to be in practically the same state as when made, and careful consideration of the following facts will enable the finishing room department to keep materials, so that they will be kept in a proper state for a considerable length of time.

In practically all finishing materials there are two conditions that affect the quality of the goods, namely, evaporation and oxidization; and these two conditions naturally play a large part in the final use and durability of the products, as both of these conditions go to make the products dry; consequently, the longer the air can be kept away from the product, the longer it will keep. Cork is the usual medium for filling the openings, but is more or less porous, and will (after a period of twelve months) go to pieces. However, it can be kept in its proper state by the liquid in the container coming in contact at all times with the cork. This is the reason why the manufacturers (in times past) of expensive wines, made a rule to have all bottles laid down on their side, thus enabling the cork to be at all times saturated with the liquid, thereby insuring a perfectly air-tight container.

With all stains and other liquids, it is necessary to shake the contents (or in other ways agitate the contents) in order that there may be perfect uniformity with all the different vehicles or solvents contained therein. This agitation is absolutely necessary, whenever a pigment is incorporated into the vehicle.

The incorporating of pigments into liquids in many cases has to be done by the user, in such instances as paste wood fillers, and enamels, in which are such pigments as heavy oxides, as it is impossible to prevent the settling of these heavy pigments into the bottom of the container, which will form a hard cake or mass, which cannot again be put into solution by the agitation; consequently, many such articles are put out by the manufacturer in a paste form, which have to be reduced by the user.

The containers in which finishing room products are sent out, are governed to a large extent, by the length of time which the products can be kept. Containers, such as cans, steel drums, earthenware jugs and glass bottles are very satisfactory mediums for the keeping of any material a long time, as such materials as mentioned above are perfectly airtight.

The woden barrel, however, is of a necessity, more or less porous, and is always subjected to the climatic changes which will expand or contract the staves of the barrel, consequently causing leakage, which is a condi

tion that practically every finishing room foreman is aware of; therefore, the storage of wooden barrels must be carefully guarded, so that they will be kept in a place where the temperature and humidity will be more or less constant.

A customer who is using goods about one hundred (100) gallons per year, should at all times buy his products in one or five gallon cans, taking from same just sufficient to finish up his work, and keep the containers as free from air as possible. This applies, of course, to the filled containers, as well as to the partly filled containers.

Slow drying stains and varnishes, etc., are not affected by evaporation and oxidization as much as the fast drying varnishes and stains are. Most varnishes will skin over (which is due to the oxidization of the oil) and this skin must be all removed before proceeding to stir up the liquid.

Shellacs, substitute shellacs, spirit copals, and other liquids containing alcohol, should not be allowed to stand longer than two or three months in a tin container, as otherwise they will turn black. This action of turning black also applies to tin containers, when any liquid of an acid nature is put into them, and it is advisable, where the product is known to contain alcohol or any acid, to put them as soon as possible, into wooden or earthenware containers.—"Finishing Facts."

"Mouthpieces of Commerce Department."

An official and generous recogntion of business and technical newspapers as essential factors in modern commerce and industry has been given by Secretary Herbert Hoover, of the Commerce Department at Washington.

One of the first steps taken by Mr. Hoover, after he was installed as head of this important department was to invite the heads of the leading business and technical newspapers of the United States to meet him in Washington to discuss with them the problems of his department. Sixty-two men accepted the invitation, and at this meeting Mr. Hoover gave evidence of his high appreciation of the value of the business and technical press by saying: "My view of the matter is that we may well consider the trade publications of the country as the mouthpiece of the Department of Commerce—the contact points by which the business world is to know what we are doing and how we are doing it, and also to carry our industry this message of co-operation which it is my hope to place before every manufacturer in every industry in the country."

As an outcome of this initial conference a monthly meeting has been arranged and every month since, Mr. Hoover has held conferences with these publishers. He has frankly admitted that the meetings with the heads of business and technical newspapers are of material benefit to him. He needs the close-up view of business and industry which he can get from those men—as he can from no other source.

The minister in charge of the Canadian Department of Trade and Commerce might profit by this experience of Mr. Hoover, and summon to his aid the heads of business and technical newspapers in Canada. A conference with these men wuld give him some vitally important information about trade conditions in Canada, which, it is safe to say, he does not possess at the present time.

Linseed Oil has its best equivalent in "FLAXICON." Either in boiled or raw, is elastic, durable and waterproof. Working to the best advantage with colors ground in oil.

Veneers and Panels

Science of Moisture Control

Working Toward Definite Objective—Controlling Drying and Storage Conditions—Immense Savings may be Effected.

By J. F. Hirt, Forest Products Engineering Co., Chicago.

Another important factor in our favor is the time required for the finished product to imbibe or give up moisture. A carload of carted panels could ordinarily be in transit for a year or more without any ill effects if they have been treated in accordance with definitely known conditions and correct practice. The reason for difficulties on this score are obviously due to a lack of comparison of conditions in the plant of the veneer and panel manufacturer and his customer, and an effort to reach a satisfactory mean E. M. C.

Panels, because of their constructions of plys at right angles, set up opposing forces that assist geratly in retarding expansion and contraction.

The same does not apply with veneers and, therefore, greater accuracy in controlling moisture and more care in shipping should be exercised. In packing high-grade figured veneers, especially crotch stock and burls, it may be advisable under some extreme conditions to use a wrapping of waxed paper.

Packing veneers under pressure is another way to decrease moisture attraction. A simple hand-operated plunger press constructed in your shipping department would not only accomplish this, but at the same time would reduce your crating costs. The crates are filled under the raised plunger of the press. The plunger is slotted to receive the top slats of the crate so they can be nailed in position while the pressure is on. This method can be used in crating rotary core stock, cross-banding, backs, and dimensioned face stock, but would not apply quite so well in crating sliced logs and sawed flitches.

Other practices tending to assist in relieving the natural contraction and expansion of wood are in a state of development at the present time, but at best none of them promise to do any more than to contribute in a measure to the full solution of the problem which brings us back to the point of finding our E. M. C. and governing our product accordingly.

The Drying of Veneers

One of the most helpful and least costly methods of controlling moisture is the proper arrangement of material storage rooms. This is a matter that has had little attention by both the veneer and panel manufacturer, and a brief resume of what commonly occurs in drying and shipping veneers might be interesting.

The veneer manufacturer may be using any of the present commercial types of dryers or even the old style kiln or dryhouse in which he piles racks, or hangs the veneer. If he is using the former, he may succeed in bringing his veneer out of the dryer in a straight condition, but the stock very often contains an unknown quantity of moisture. If an effort is being made to dry it to a definite moisture per cent., the calculations on which this is based are sometimes incorrect. At any rate, the veneer is seldom at a moisture content in equilibrium with the air when it leaves the dryer and, therefore, it will either give up more moisture and shrink, or it will imbibe moisture and expand; in any case this "working" will not be evenly distributed over the surface of the sheets and local expansion, or "buckling," will result. If the stock is piled on trucks and rushed into crates, it will perhaps remain fairly straight until received by the customer.

In case the more obsolete equipment is used, it is impossible to dry the stock flat and very often without severe checking. What is still worse, an effort to dry to the correct moisture content is very seldom made. Usually the stock is said to "look and feel" dry, and the manufacturer consoles himself with the thought or expression that it is as good as his competitors are doing anyway, which is an assumption that may apply less generally in the near future.

Care in Handling and Storing

At our next observation we find the crated veneer or bundled flitches being unloaded at the customer's plant. We often see oak flitches thrown on the factory floors without even making any effort to control the moisture. Crated stock, as well as the veneers, are often dumped into a cool, damp basement, so that even if the stock had been dried correctly by the manufacturer, it would again imbibe moisture with the results previously explained. Then the customer redries the stock when he is ready to put it into panels. Here again he reduces the moisture content to the unknown quantity. To overcome the mistake of incorrect drying at this point, the stock is rushed right through the jointing, taping, and joint gluing operations into built-up bundles, when the veneer is considered quite safe, at least from "buckling." If something happens during this regular process, the taped-up veneers often take on enough moisture again and buckle so badly that they must be straightened out. In this event they are again redried to the same unknown condition, which is usually too dry, and then the regular process is again carried out.

In drying veneers the general assumption seems to be that the chief requisite is to get them sufficiently dry. This is decidedly wrong, as just as bad as not dry enough, providing the moisture has been reduced below the danger of mould. Without losing sight of our objective, I would like to point out right here one of the great sources of lost energy and money which is contributed to jointly and perhaps equally by the veneer and panel manufacturer. It is not uncommon to find veneer manufacturers loading

their logs to the limit of moisture they will hold in preparing them for the lathe or slicer through either one of the two methods: boiling or steaming, at atmospheric pressure. The procedure is then to dry them far below the E. M. C., which causes the stock to pick up moisture to this point. Then the panel manufacturer stores the stock where it will pick up still more moisture, and again redries it to a percentage considerably below the E. M. C. in his plant. After all this procedure, complaints are still heard from all quarters about "buckling" and breakage. I am trying to emphasize that each unnecessary drying operation adds just that much more to your unit costs, and in addition there is always more or less material lost in handling veneers even under correct procedure.

Keeping Stock in Good Shape

By proper storage, veneers will not only be held in perfect shape, but as a matter of fact can be improved and brought into absolute equilibrium with the atmosphere, and at this point will remain perfectly flat. Therefore, instead of dumping them into a moist basement or shed or any other room in which the atmosphere is not controlled, why not make these storage spaces into conditioning rooms?

This can be accomplished at surprisingly small expense. It requires proper arrangement for retaining uniform temperature and humidity and means for circulating the air within the room.

Under these conditions the veneer manufacturer could leave his stock stored almost indefinitely without injury. The panel manufacturer could do the same, and, what is more important, he can forget all about his redrying operation except in cases of stock that must be glued soon after it is received. Of greater importance still is the assurance that stock taken from a properly arranged and controlled conditioning room will remain straight and flat, because it will neither be taking on or giving up sufficient moisture to cause any local expansion or contraction.

What occurs in drying and controlling moisture in veneers is almost identical with lumber except as stated at the outset, the time required is proportionately greater according to the thickness, and no matter what specie of thickness of lumber you are drying and regardless of conditions under which you are manufacturing, there is no reason why any of the common ills should be tolerated.

Cause of Drying Troubles

Case-hardening, excessive warping, bowing, cupping, and honeycombing are all due to unequal drying. In other words, the atmosphere in the kiln is too dry in comparison to the moisture in the stock, and, therefore, the outer portions of the board shrink faster than the inside, because the moisture can not be transfused outwardly fast enough to prevent this. When the outside portion of a board is dried in this way, the fibres are drawn or stretched apart over the wet interior and set rigidly in this condition. Surface checking results frequently in this case, but more often this does not occur. A board, when warm and moist, is somewhat plastic and is not unlike papier mache. When the outside portions of a board have taken a rigid position or formed a shell, it is known to be "case-hardened."

Later on in the drying period, when the inner portion gives up moisture, and consequently must shrink, it is prevented from doing so by the set outer shell. When the internal stresses develop beyond the strength of the fibres, numerous ruptures occur, which we call "honeycombing." Practically all other drying ills can be attributed to the same causes.

Working Out Drying Schedules

Drying schedules should provide specifications of temperatures and humidities for moisture content in the species you are drying in five per cent. reductions. As for example, drying conditions for black walnut containing over 40 per cent. moisture, which is to be used for high-grade furniture, can safely be started at a temperature of 115 deg. Fahrenheit and 85 per cent. Relative Humidity. Tests of the lumber should be made to determine a change of these conditions, as time is a very poor indicator. When the stock shows a reduction in moisture to 35 per cent., the temperature should be increased to 120 deg., and the humidity lowered to 80 per cent. This procedure must be carried out by degrees in accordance with frequent tests of the lumber to an ultimate condition of 150 deg. Fahrenheit and 30 per cent. relative humidity. It may be noted that the first or initial drying condition is equal to an E. M. C. of much less than 40 per cent. moisture; in fact, it is between 16 per cent. and 18 per cent. It is, of course, necessary to maintain a considerably lower E. M. C. than the moisture in lumber in order to reduce it, and, in other words, these conditions indicate a safe drying speed. Because walnut in drying is subject to fine surface checking and other uncommon ills, and for the reason that in this case the stock is to be used for high-grade furniture, conditions are controlled from 40 per cent. moisture instead of 30 per cent., which may be applied in less exacting circumstances, and, in fact, conditions considerably more severe can be applied when the kiln operator at all times is thoroughly familiar with what actually is taking place in the lumber and the kiln.

Tests should be made on two pieces—one to determine the average moisture content and the other to determine distribution of the moisture. The first is common, the second is made by cutting away the outer shell to a line about ¼ inch all around the section and testing this and the remaining centre piece separately. This is very important, especially in all cases where considerable case-hardening and other troubles exist which can only be eliminated by correction of faulty kiln design.

I have attempted to outline in this discussion the fundamental and known principles underlying the process of reducing and controlling moisture in wood and the logical deductions to aid in their practical application in the manufacture of veneers and panels. Discussion of the various details of operation and design of drying equipment has been purposely avoided, my aim being rather to establish the standards with which you can study and compare your present methods and practices.

One advantage the chain mortiser has over that of the chisel one is that it does not make so much noise.

Keep your mortise chain well sharpened, and you lessen the possibility of it breaking.

A very small electric emery wheel, which could be held against the cutters when they are on the machine, would save a great deal of rubbing with the oil stone.

Test babbitt metal by putting a stick in it. If it just browns the stick it is the right temperature; if the stick catches alight it is too hot.

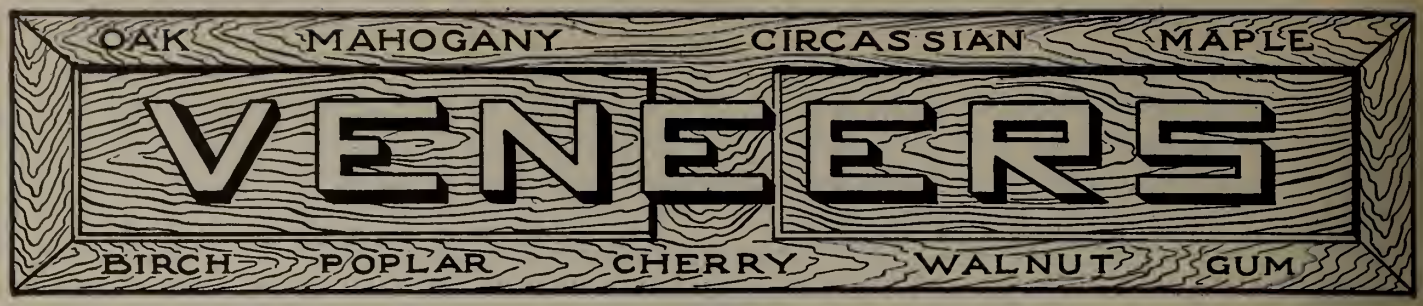
ESTABLISHED-1867 HB INCORPORATED-1904
Reg. U.S. Pat Off.

WHAT does it mean to you as a buyer to have implicit confidence in the source of your most important raw material supply? For instance, all informed buyers recognise the true superiority of northern grown hardwood lumber and veneers—the product in which we specialize. Big customers stay on our books for years because it is easy for them to determine that we never have cut anything but the genuine northern grown logs in oak, walnut, maple, ash and other major species. The same sincerity maintains with our rotary cut poplar offering. And withal is that correctness of manufacture and honesty of contact with customers that has been the bulwark of this business for over a half century. It will profit you to know us better.

Hoffman Brothers Co.

Ft. Wayne, Indiana



Poplar and Walnut
Veneers

We specialize in large size poplar veneers as we have extra fine poplar logs. We can cut veneer up to 10 feet square.

Our walnut veneer cannot be beat, both in plain and figured wood.

How Many Feet of Panels Do *You* Get From a Thousand Feet of Veneers?

FOR two generations Bachman has been supplying veneers that will lay fifty per cent over the average. That is no boast—there are five sound reasons why we can do it year after year:

(1) Our logs are absolutely all from Indiana—hence no costly defects in veneer.
(2) We use no flitches except our own manufacture. Thus we are able to carefully select our veneer logs.
(3) All veneers are cut full thickness. This gives plenty of wood for sanding and minimizes breakage in handling.
(4) The sawed stock is so smooth that it can scarcely be told from sliced.
(5) Our stock is never either sorted or picked over.

Our cut runs principally 1/16″ and 1/20″ quarter-sawed white oak, but includes sliced quartered oak; sliced walnut and butts and sliced gum. We are now able to offer to careful buyers the same old fashioned service that has been the pride of our business for two generations.

Do you wish a place on the list? Write

An organization complete in all details is a guarantee of correct product if properly operated

The operations of the Wood-Mosaic Company function with precision because every step has been part of a well-conceived plan. The basic thought is a plant for each type of production. Thus, every foot of Wood-Mosaic hardwood lumber and veneers in walnut, oak and poplar is produced in a plant designed especially for the manufacture of each class of product.

This holds from the logs, which are the careful selection of a trained corps of twenty timber buyers, through the final operations of handling the manufactured product, special equipment having been provided for each unit of manufacture so that the lumber and veneer product may be always correctly dried and further prepared for consumer's use. We solicit the opportunity of demonstrating the value to you of such an organization.

ALGOMA *the Better* Plywood

Speed!

Did you ever get an order of plywood SHIPPED THE DAY YOUR ORDER WAS RECEIVED?

If you did, was it absolutely correct in surface, correct in dimensions, seasoned, and ready to use?

Such accurate speed is a regular occurrence with Algoma, the Better Plywood. We have a special label to put on orders shipped in this way—we are proud to give such service and offer it to you.

The reason we can handle rush orders so perfectly is that we always work ahead on stock-sized panels. We have a large quantity, in great variety, ready for such emergencies. In a few hours they can be cut, crated and shipped. Whatever you make of plywood, you can make better with Algoma Plywood. Prove this fact by trying one order.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

Time Proves Permanency of Veneers

Investigation Discloses this Practice Common from Earliest Times — Many Famous Pieces are Veneered — Should Answer Skeptics as to Serviceability of Veneered Work

The forthcoming $50,000 trade extension campaign of the National Veneer and Panel Manufacturers' Association bids fair to take a position of importance in the ranks of group movements. The advertising and publicity will be directed by William Clendenin, of the Conover-Mooney Co., Chicago, who conducted the research work for the National Association.

In an interview for "Canadian Woodworker and Furniture Manufacturer," Mr. Clendenin, explaining the purposes and plans of the proposition, stated:—Without tracing the cause, a prejudice seems to have developed in America against things veneered, and even the word "veneer." Realizing the injustice of this indictment, and in order to remove from the public mind this unwarranted prejudice, the Publicity Committee of the National Veneer and Plywood interests had about decided to drop the term "Veneer."

Dates Back to Earliest Times

Before doing so, however, we recommended a research to determine the status of the art, if such it was.

It was found that the art of veneering goes back historically to the dawn of time. The finest furniture of the Pharaohs of Egypt was veneered. The principle of flywood, as well as veneer, was known to them, to the Assyrians, Babylonians, Greeks, and the ancient world generally. Photographs of original fragments and original pictures prove this beyond question. The whole process of veneer has been found delineated on the wall of the tomb of the Pharaoh of the Exodus, described in the Bible.

The throne of Sennacharib, of the Assyrians, was veneered. The warships, the longboats, of Rameses II. of Egypt were built of plywood, on the same principle that the new patrol-wagon bodies of the Department of Police of Chicago are built of plywood, because bullet-proof, bandit-proof—and superior to steel for the purpose.

George Washington's writing desk was veneered; also those of Thomas Jefferson, William Penn, and Dolly Madison. The finest furniture of the famous English periods—the masterpieces of Chippendale, Hepplewhite, the brothers Adam, Sheraton; the famous chest of Cornwall built in Italy in 1592, and probably the forerunner of our modern creations in this line; small pieces de resistance by Cellini, done under the splendid patronage of Francis I., "King of the Renaissance"; superb and exclusive specimens of Florentine veneers, including the world-famous credenzas; specimens in kind from "The Treasures of the Vatican," all owe their excellence and permanence to veneers. Reproductions of plates and authorities taken from Sir Austin Layard's "Assyrian Manuscript," and English magazine articles on Sheraton; "Arts of the Ancients"—including Nippur, Chaldea, Babylon, and Persia; also Hellsing's elaborate French work and plates describing the treasures of the Museum of Cluny, Paris; Jacquemart's "Furniture"—a Viennese work on medieval furniture by von Falke; together with various references in the Ames manuscript (East Indian and Hindoo), in possession of the Crerar Library, Chicago, are convincing evidence of the merits, longevity, and value of veneered articles.

Must Have Some Recommendation

Going back again to the classical period—Cicero paid $45,000 for a veneered table of citrus wood. The proudest possession in the palace of the imperial Caesar was a veneered table. "Tiger Tables," "Panther Tables," and "Bee Tops" were literally the vogue in ancient Rome—and every one of them veneered.

Very ancient specimens of plywood construction and veneered surface are peresrved not only among the treasures of the Vatican and the famous museums of the Louvre and the Cluny of Paris, but also in the South Kensington Museum in London, the British Museum—not to mention many famous specimens preserved and treasured in this country. For instance, in the museum of Portland, Maine, they have the famous escritoire or writing cabinet of Marie Antoinette, saved from the wreck of the French Revolution and brought to this country by General Knox. All these pieces are veneered—as is also the most beautiful piece of furniture in the world, the "Bureau du Roi," the cabinet of the king—made at a cost of half a million dollars for Louis XV. of France.

The little cabinet which the soldiers of the Old Guard called the "Bureau de Campagne," and which accompanied Napoleon on the most famous battlefields of Europe—was a veneered piece done in rosewood.

Prove Serviceability and Permanence

The importance of these facts is that they are at once the supreme answer to the prejudice against veneer. Veneer is a fine art and has been through the highest civilizations of mankind and in every land, anciently, through the medieval period and the Renaissance, down to the splendid modern processes which made veneer the fine art of today.

Hundreds of photographs of these specimens and exhibits were accumulated during the course of this research and will furnish the background and picture matrial for the advertising campaign, both for veneer and plywood.

The trade extension advertising campaign will include trade papers, to reach the business interests concerned, also leading publications read by the general public. The campaign will be educational in character and every point advanced will be proved by authority and photograph. All advertisecments, booklets, and follow-up literature will convey two stories, one on veneer and the other on plywood, showing the built-up laminations or layers of plywood and the grains of the alternate pieces running at right angles, all bound together in monolith by glue and under heat and pressure. The campaign will be launched this fall.

Emery is in its right place when made into a wheel. When allowed to get into the bearings of a machine its usefulness is gone, and its cutting powers spoil the bearings.

VENEERS

The Quality Kind

We carry in stock, for immediate shipment, 3 and 5 ply Panels in Birch, Oak, and Mahogany — sizes 24" and 30" wide, 48", 60" and 72" long.

A complete range of American Walnut, Quartered Oak, Mahogany, Figured Gum Veneers and Rotary Cut Veneers.

It is not uncommon that a really fine piece of furniture has been practically ruined after a few months service because of the poor grade of veneer used. Such happenings do much to harm the manufacturer's reputation. That is why many will not consider anything but the best—usually they insist on Toronto Veneers—the quality kind.

Plywood Automobile Wheels

One of the newer developments in the production of plywood articles is the manufacture of built-up wood wheels for automobiles and trucks. These wheels, which are known a sthe "Smith Woodisk Wheel," are made of the same woods as were used in the propellers for aeroplanes, and are so constructed that the grain of the different layers of wood runs in various directions. In weight they are about the same as the ordinary wooden wheels with spokes, but are much stronger, particularly in regard to side stresses, i.e., skidding strains. The wheel band, which is of steel, is shrunk on what practically amounts to end grain and, therefore, does not work loose or slip.

In comparison with cast steel wheels for auto trucks, they show a saving in weight of 33 pounds for each rear wheel, and 42 pounds for each of the front wheels, giving a total saving in unsprung weight of 150 pounds in favor of the laminated wheel. It is also claimed that, owing to their resiliency, they absorb a certain percentage of the knocks and jolts encountered on the roadway.

The use of disc wheels, whether of wood or steel, is growing in popular favor. This is probably due to the fact that they give the car an air of smartness which would otherwise be unattainable. In addition they conform to the finish and general lines of the car. It would appear as if, when the advantages of the laminated wood wheel over those of steel construction are more widely recognized, that this type of wheel will be adopted as standard equipment by many of the larger manufacturers of automobiles, as well as being in strong demand by car owners in general.

This is but another step in the direction of the all-wood car. At the present time there are cars on the market with laminated wood tops, laminated wood bodies, wood frames for the chassis, and now we have the plywood wheel.

Comparative Prices on Basic Commodities

A recent issue of the "Commerce Monthly," published by the National Bank of Commerce of New York, contains a number of wholesale prices on every-day commodities which are of particular interest because they give comparative values covering the years 1913 to 1921.

Cattle that were selling for $7.85 a cwt. in January, 1913, $8.60 in January, 1914, and which reached $16.80 in October, 1919, are now being offered at $8.10. Anthracite coal, $4 in January, 1913, advanced to $8, October, 1920, is now selling for $7.90. Bituminous coal, run of mine, based on values in the Pittsburg district, was $1.30 in January, 1913, $10 in July, 1920, and is now selling for $2.50. Copper was quoted at $17 in 1913, $28.25 in 1916, while to-day's quotation is around $1.37. Cotton, $12.50 in 1913; $41.50 in April, 1920, and $11.88 in July, 1921. Hides, 18¾c in January, 1913; 52c in July, 1919; 13c in July, 1921. Hogs, $7.40 a cwt. in January, 1913; $8.25 in January, 1914; $22.10 in July, 1919; $9.40 in July, 1921; Pig iron, $16.35 in January, 1913; $46 the latter part of 1920; $19 in July, 1921. Steel billets, $29, January, 1913; $20, January, 1914; $65, April, 1920; $33, July, 1921. Lead, $4.35, 1913; $9, April, 1920; $4.55, July, 1921. Crude Pennsylvania petroleum, $2.05, January, 1913; $6.10, the latter part of 1920; $2.25, July, 1921. Crude rubber, $1.10, 1913; $16.50, 1914; 56c, July, 1921. Wheat, 91c a bushel in 1913; $3.10 in January, 1920; $1.40 in July, 1921. Wool, 72c in January, 1913; $2.33 in April, 1920; 83c in July, 1921.

A glance at these figures will show that, while the values of some of the commodities are still considerably above their pre-war levels, such items as cattle, copper, cotton, hides, petroleum, and rubber are selling to-day at prices below those which prevailed in 1913 and 1914. Iron and steel and wheat are considered to be basic commodities which, if they do not control, give a fair indication of the trend and level of values. Iron is still about 35 per cent. higher than it was in January, 1914, but the present quotation of $19 per ton shows a marked reduction from the peak price of $46 reached in 1920. The same holds true of steel. It is still a little over 50 per cent. higher than it was in 1914, but, like steel, this commodity shows a decline of from 50 to 60 per cent. from the high levels of 1920.

On the whole, these figures would seem to indicate that values are rapidly reaching a level—some have already touched such a point—which presages a return of business in normal volume. Iron, steel, and labor are still declining, and when these commodities drop to a satisfactory figure, we can look for business to increase in a very satisfactory manner.

J. Victor Tobey, a former resident of Owen Sound, has invented a dispensing showcase for use in grocery stores. It is claimed that this is an improvement on any similar line on the market, being a dispensing showcase, a display case and a silent salesman combined. The device has a glass front for display, a drawer for sampling and a hinge top for refilling. One feature of the bins is the fact that the goods are taken from the bottom and as each scoopful is withdrawn, the contents automatically drop. This assures that the old stock is sold first as the new stock is always on top. Application has been made for patents, and if granted, this device will be put on the market.

WE HAVE A COMPLETE STOCK OF 3 and 5 PLY PANELS IN VARIOUS WOODS AND THICKNESSES FOR QUICK SHIPMENT

Also offer ⅜" 3 ply Fir s-2-s Panels for Drawer Bottoms and Backing.
⅛" Rotary Cut Northern Red Oak
⅛" Rotary Cut Northern White Oak.
⅛" Birch Veneer 6 to 36" wide 60 to 86" long.
Panels also made to your dimensions.

PREVENTION AND REMOVAL OF GLUE STAINS.

Casein and vegetable glues containng caustic soda produce stains on certain kinds of wood, notably the oaks, maple, cherry, elm, ash, birch, and beech. Some glues stain the wood more than others, and those that contain the most alkali are likely to be most injurious Staining is due to the action of the alkali in the glue on the tannins and other constituents of the wood, whereby a substance related to ink is formed. No means have yet been found of preventing this chemical action. Precautions can be taken, however, which will keep the discoloration from the finished surfaces. The most trouble with glue stain in woodworking is caused by the penetration of the glue solution through thin face veneers. This seepage s very likely to occur if the veneer is less than 1/20 inch thick and somewhat porous. The consistency of a glue in part determines whether it will be squeezed through the wood or not. It is quite obvious that under similar conditions a thin glue will penetrate further than a thick glue. For this reason the quantity of water that is added to the glue might be deminished and "fillers" added when staining is feared. The amount of pressure exerted by the panels in the press is also a factor, but it would not be advisable to reduce the pressure in order to check the flow of the glue.

If a panel is dried promptly, the caustic-soda solution will have difficulty in coming to the surface. Rapid drying can be brought about by removing the panels from the press as soon as it is safe to do so, and placing them on stickers. The amount of staining can also be decreased somewhat by placing a caul or some other flat object between adjacent panels in the press.

Casein and vegetable stains can be almost entirely removed by sponging the staned surface with an oxalic-acid solution, prepared by disolving 1 ounce of oxalic-acid crystals in about 12 ounces of water. Still better results may sometimes be obtained by moistening the wood first with a sodium-sulphite solution made up in the same concentration as the oxalic-acid. In this way very stubborn stains can be almost obliterated.

USE AND CARE OF DRY KILN INSTRUMENTS.

The correct use of the hygrometer is of vital importance in the interpretation and consequent regulation of kiln conditions. Drying conditions altered because of the false conception of the conditions present often result in honeycomb and other highly detrimental degrade. Several basic practices are guggested by the Forest Products Laboratory for the proper handling of hygrometers.

Calibration.

Hygrometers should never be assumed as registering the correct reading until their accuracy has been established. It is not at all unusual for a thermometer to register a few degrees higher or lower than the correct temperature. Each thermomenter of a hygrometer should be checked against a standard thermometer of known accuracy over the range of temperatures anticipated in its use. Corrections for several temperatures may thus be determined if inaccuracy exists. Checking should be done with the bulbs of the standard and the tested thermometers close together and in the same medium and temperature of medium. The correction factor for a thermometer at a certain reaing being known, it is simple enough to determine the true temperature.

Filling and Care.

Hygrometer reservoirs should be filled with pure water only. The open-top type of reservoir is easily filled but the inverted type often presents difficulties. The latter type may be filled if submerged horizontally in a pail of water with the water level slightly above the well opening. Others methods of filling such a tube are by means of a wash bottle or small bentstem funnel. In any case the body should be dropped below the mount level.

It is important that silk or muslin covering of the wet bulb be kept in good condition at all times. At least a small amount of solid material is always left in the meshes after evaporation, and sooner or later such deposit impedes the transfusion of miosture. It is because of this pure or distilled water should always be used in the reservoir and that the wick frequently be changed.

Placing the Hygrometer.

The hygrometer should be placed at exact points where information as to conditions is desired. Do not place it near a door or a wall, or where it will be subjected to direct radiation from the heating coils, as conditions at these points are probably not representative. To obtain representative conditions take an average of several readings in different parts of the kiln.

Taking the Readings.

In reading the wet-bulb thermometer care should be taken that there is sufficient air circulation to give the maximum evaporation rate from the bulb covering, at low temperatures, i. e., up to 120° F., there should be an air velocity of at least fifteen feet per second. At the higher tempeartrues this rate is not quite so essential. A thorough fanning of this air about the wet bulb is usually required. The lowest wet bulb reading for any air condition is the one desired.

EXPORTS OF BOX SHOOKS.

According to figures contained in the May issue of the Monthly Trade Report, the Canadian manufacturers of boxes and box shooks are gradually increasing their export trade. The figures for April and May 1921 show exports of these lines to the value of $168,000. as compared with $64,000. for the same period of 1920 and $50,000. for April and May 1919. This total is made up as follows:—Exports to U. S. markets $20,000.; Australia, $1,000.; Straits Settlements, $140,000.; British South Africa, $5,500.; British West Indies, $1.000. These figures only go to show the possibilities which lie in the export of boxes and box shooks.

There are many other large foreign markets, such as Egypt, India, South America and others, which apparently have not been touched by Canadian manufacturers. The imports of box material by some of these countries runs into millions of dollars.

Heavy felt fasteners are very dangerous in belts. They may come against one with terrific force when the belt breaks.

The chances of accidents increase rapidly with every hour a man works without a rest. Four hours should be the limit for one period of work upon a machine.

Adverse Conditions Have Not Affected the Quality of Our Lumber or Service

AT ONE POINT in the development of a modern busines its driving force may keep it going brilliantly while conditions are favorable. Later it gains a solidly established state, imparting a degree of momentum sufficient to maintain the forward movement even under the most trying circumstances.

So with the Anderson-Tully Company, pioneer manufacturers of Southern hardwood lumber, veneer and plywood. Great diffculty in operation has in no way impaired our ability to serve you correctly. The Anderson-Tully Company trademark will always be known where the best in goods and service are most appreciated.

The garage of the M. F. Beach Co., furniture manufacturers, Winchester, Ont., was recenty destroyed by fire; loss $20,000.

An addition is being made to the plant of the Crown Furniture Co., Limited, Preston, Ont. This will be used as a machine shop.

Calvin S. Kunkel, Canadian representative for the Marietta Paint & Color Co., Marietta, Ohio, recently joined the ranks of the benedicts.

F. A. Shand, president of the Windsor Furniture Company., Windsor, N. S. spent a few days in Toronto recently on his way to B. C.

Casavant Freres of St. Hyacinthe, P. Q., recently installed a new organ in St. John's Church, Arthur, Ont.,

Mrs. E. B. Eddy, widow of the late president of E. B. Eddy, Co., Limited, Hull, Que., recently passed away at her home in Ottawa.

Spence & Wilds, furniture manufacturers, Vancouver, B. C., have disolved partnership. The business will be continued under the directorship of J. Spence.

J. A. Cadenhead of Toronto, formerly with the Anderson-Miller Lumber Co., has been engaged as an inspector with the National Hardwood Lumber Association, and has entered upon his new duties.

The Brockville Furniture Co., Brockville, Ont., who have been conducting a retail business for many years, recently commenced the manufacture of a line of high-grade Chesterfields.

John W. Nelson recently opened a cabinet-making and upholstering shop at 216 Wellington St. Sarnia. Mr. Nelson has had many years' experience in this line and should make a success of his new venture.

Chandler & Allen are equipping a new woodworking plant at Windsor, Ont. The lines to be manufactured include sash, doors, cabinet work, interior and exterior fixtures and fittings of all kinds and store fronts.

The sawmill and woodworking plant of the Richards Mfg. Co., Campbellton, N. B., was recently destroyed by fire. The loss amounts to about $60,000. In all probability this plant will be rebuilt early in the coming year.

Beique, Limited, Montreal, were recently incorporated to manufacture and deal in pianos, phonographs and other musical instruments. H. M. Duchesne and C. A. Beique, both of Montreal, are two of the incorporators. Capital $20.000.

N. Blain, Limited, Montreal, were recently granted a provincial charter to manufacture and deal in carriages, wagons, sleighs, motor trucks and automobiles. Capital $49,000. Hector Blain and Albert Blain, two Montreal accountants, are among the incorporators.

A general meeting of the newly incorporated Alliston Wood Products Limited was held at 95 King St. East, Toronto, on August 9th for the purpose of electing a board of directors.

The St. Johns Board of Trade Housing Scheme Co. contemplate erecting a large number of houses in the near future. The sum of $150,000. has been granted them and if found necessary, another $150,000. will be forthcoming.

A firm known as the "Canadian Automatic Barrel Machinery Co., Limited," Toronto, was recently incorporated with a capital of $1.000,000., to manufacture barrels and barrel-making equipment. A. G. Ferguson, barrister-at-law, and E. C. Buckle, builder, are among the incorporators.

The Berliner Gramophone Co., Montreal, held their eighth annual picnic recently. About 1200 persons were in attendance. Edgar M. Berliner, vice-president of the company, and R. L. Chivers, sales-manager, together with the entire executive staff, were in attendance.

Delaney & Petit Co. of Toronto, are now manufacturing a line of sandpaper, This firm has been handling this product for many years but it is only recently that they commenced producing a line of their own. The brands, grading and quality will be the same as that with which they have been supplying the trade.

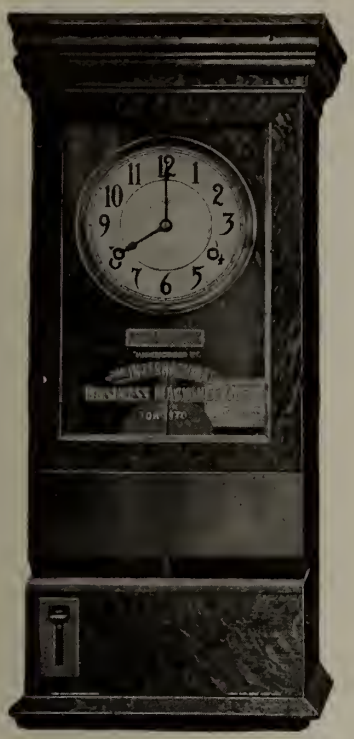
According to a Kingston report, the Collingwood Shipbuilding Co. have put into effect a 55-hour week, that is 10 hours per day for 5 days, with 5 hours on Saturday. A slight reduction in pay was also embodied in the new announcement. Some time ago the same shipyard reverted from the 8-hour day to the 9-hour day.

Bournival Piano & Gramophone, Limited, Montreal, were recently incorporated to manufacture and deal in pianos, phonographs, musical instruments of all kinds and household furniture. Capital $200,000. L. O. Bournival, M. D., Outremont, P. Q., and J. E. Drouin, Sault-aus-Recollets, Montreal, P. Q., are two of the incorporators.

The Chatham plant of the International Harvester Co., Limited, is being equiped to manufacture "International" motor trucks. Heretofore these trucks have been imported from the American plant. This change has been found necessary because of the increased demand. The Chatham plant formerly produced a line of wagons and sleighs.

McLagan Phonograph Corporation, Limited, Stratford, Ont., have issued a new price list which shows a considerable reduction over previous lists. This is in keeping with their policy of cutting their prices as low as possible without sacrificing quality. The McLagan phonograph has been accorded gererous support, having met with popular demand, and it is only through high production that such reasonable prices are possible.

The North American Funiture Co., Limited, Owen Sound, recently furnished a rest room for their employees. This room is about 20 ft. square and is situated on the main floor of their factory. Both hot and cold water are available and an electric stove has been provided for heating tea, coffee and other food. A number of comfortable settees are being built and when completed will be placed around the room, giv-



THE
INTERNATIONAL
Job Time Recorder

by which your actual productive hours are easily computed. It gives you a reliable printed record of every job—a record that you know is accurate and unchangeable. It is flexible enough to easily handle the work of any department in your plant.

The number of large furniture and woodworking factories that have installed them is your assurance that they are a profitable investment.

Time - Loss Insurance

Almost every business risk is covered by modern insurance except perhaps – ***loss of time.***

If you have a system that keeps an accurate record of the labor purchased, you are only "half insured"– you are not protected against loss of production.

We suggest a complete ***time-loss policy*** – one that checks your productive hours against your purhased hours. It is the only sure method of regulating your labor costs.

INTERNATIONAL Time Recorders and Job Time Recorders

will give you ***absolute*** protection. You can tell by a glance at the printed sheets or cards the margin of difference – the margin that represents a dead loss in your production costs.

This difference can only be regulated to the lowest point by records that are accurate, unchangeable and at all times readily accessible.

If you are interested in insuring your plant against ***time-losses*** and ***under-production,*** get in touch with our nearest branch.

International Business Machines
SPEED ACCURACY ECONOMY

International Business Machines Co.
LIMITED

F. E. MUTTON, Vice-President and General Manager

Head Office and Factory: 300-350 Campbell Avenue, Toronto

HALIFAX, 44 Granville St. ST. JOHN, 29 Dock St. QUEBEC, 506 Merger Bldg. MONTREAL, 1 and 3 Notre Dame St. OTTAWA, 190 Queen St. TORONTO, 409½ Yonge St. HAMILTON, Room 8, 36 James St. S. LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd. WINNIPEG, 227 McDermott Ave. VANCOUVER, 230 Cambie St. SASKATOON, 254 Third Ave. S.

Also manufacturers of International Dayton Scales and International Electric Tabulators

ing it a comfortable, cosy appearance. A fine large library table and a bookcase for magazines, trade journals and other reading material, completes the furnishings. At the present time about eighty men are employed, but as the prospects are rather bright for increased business in the fall, it is expected that the staff will be increased.

H. Leir and M. S. Peacock are equiping a box factory to be operatted in connection with their sawmill at Penticton, B. C. They have purchased a box factory at Langley Prairie, B. C., and are moving the machinery and other equipment to Penticton.

E. D. Palmer, the energetic representative of the Windsor Paint & Varnish Co., Limited, Windsor, Ont., is once more able to resume his duties and call on the trade. Mr. Palmer has been seriously sick during the past nine months and his many friends and acquaintances will be glad to see him in harness again.

The John Morrisey Furniture Co., Limited, Newcastle, N. B., was recently incorporated to take over as a going concern the business conducted at Newcastle, Caraquet and Dalhousie, N. B., by John Morrissey, and to manufacture and deal in furniture, lumber and wood products of all kinds. Capital $75,000.

The large planing mill of the J. B. Snowball Co., Chatham, N. B. was recently visited by fire. This part of the plant was completely destroyed and it was only by strenuous efforts that the foreman suceeded in saving the large sawmill and stock of lumber. The loss is a heavy one, particularly so as this was the only part of the plant which was in operation.

Figures recently issued by the Dominion Bureau of Statistics covering the furniture industry in Canada during 1920, deal with 270 individual plants; total capital invested $24,500,000.; number of employees 9000; aggregate salaries and wages $7,900,000.; cost of material used $9,700,000; total values of product estimated at point of manufacture $25,175,000.

Patrick Ryan recently passed away at his home in Toronto. Mr. Ryan was a partner in the firm of Ryan & Hughes, manufacturers and dealers in antique furniture. The deceased was born in Lismore County, Ireland, and came to Canada at an early age, settling in Guelph. He moved to Toronto about sixteen years ago. Thomas F. Ryan, manager of Ryan & Hughes, is a brother.

The different furniture factories at Stratford, which have been idle for periods of varied length, resumed manufacturing on August 2nd. Orders have been coming in more freely of late and from present indications there will be sufficient work to keep the factories operating for the balance of the year. This affects the McLagan Furniture Co., Limited; Stratford Chair Co., Limited; Farquharson-Gifford Furniture Co., Limited, Globe-Wernicke Co., and Kindel Bed Co.

It is hard to understand why, when Canadian plants are in need of orders to provide work for their employees, that the imports of certain lines of woodwork, such as doors and furniture, should remain at a comparatively high figure. During April and May 1921 doors to the value of $46,000., were purchased in American markets, while for the same period furniture to the value of $58,000., was brought into Canada.

The Canadian Air Board contemplates the construction of an all-Canadian flying boat, designed and built in Canada to meet Canadian civil flying conditions. This Board is doing all in its power to foster the air craft industry, and it is felt that the designing of a special flying boat, to meet conditions peculiar to Canada, may pave the way to operations on a larger scale. The design is to be based on the experience gained from actual operations and experiments which have been carried out.

Certain buildings belonging to the Sutherland-Innes Co., Limited, Chatham, Ont., cooperage stock manufacturers, were recently destroyed by fire. The loss amounts to around $15,000. The buildings destroyed were filled with staves, heading and hoops, very little equipment beng burned. Manufacturing operations are being carried on as usual.

A Fredericton despatch records the arrival of the Stratford furniture manufacturers who left recently for a tour of the Maritime Provinces. The party includes L. J. Salter, H. W. Strudley, Chas. Farquharson, D. W. Burns, W. J. Anderson, Chas. Lordley and Mr. and Mrs. Moore. The visitors were entertained by the local furniture men and were shown the various points of interest in and about the city.

Meaford Mfg. Co., Limited, Meaford, Ont., are placing a line of attractive furniture on the market in what is known as "Meaford Walnut Finish." This has a very handsome appearance and can scarcely be distinguished from real walnut. It is secured by transferring the imprint of walnut grain to maple and then finishing by a special process. Meaford walnut will be made in dining room, bedroom, hall and library furniture.

The Da-Nite Furniture Co., Limited, were recently incorporated to manufacture and deal in folding and apartment furniture of all kinds. The line includes folding davenports, combination bed and table, combination dressing table and bedroom table, and combination desk and table. Capital $200,000. T. Draper and R. Walton, both of Toronto, are among the incorporators. In connection with this new firm, the W. A. Moore Co. of 11 St. Albans St., Toronto, have secured a contract to manufacture their lines.

The Georgian Bay Stave & Shook Mills is the name of a concern recently organized in Owen Sound, Ont., to manufacture barrel and keg staves, heading and boxes. N. E. Bumstead and W. E. Theaker are the proprietors of the new company. A building formerly used by the Grey & Bruce Cement Co., has been taken over and the necessary equipment is being installed. It is not expected that the plant will be in operation in time to cater to the apple industry, but several orders have been secured for kegs for nails, iron, etc. A considerable volume of business is in sight, and it is expected that the plant will be able to operate continously.

The Japanese box manufacturers are becoming quite a factor in the Indian and Singapore markets. They import rough dimension stock from B. C. and resaw it up in their own plant. The government of Japan maintains an import duty on woods of various kinds and sizes, but for some time large timbers have been permitted to enter Japan duty free. For this reason the box manufacturers of the country have been importing big timbers up to 25 x 24 x 40' long. However, special provision has been made for the free entry of lumber to be worked up into boxes and box shooks. This should have the effect of stimulating the box industry.

One Reason why Kraetzer Cured Gum is Straight and Flat.

Kraetzer-Cured Gum

THE ONLY KIND THAT IS ALWAYS BRIGHT, STRAIGHT AND FLAT

Kraetzer-Cured Gum does not "work" after being made up into furniture. It does not warp or open at the joints, or check in panels in the way that other less scientifically handled lumber does.

If you have used Kraetzer-Cured Gum, you know this already. If not, you owe it to yourself to find out about this super hardwood.

This "quality product" does not happen by chance. One reason is that Kraetzer-Cured Gum is steamed in the Kraetzer Preparator. Then every board is carefully graded, the sticking is scientifically and perfectly done, every stack is side ventilated, is elevated, and every pile is on wheels. Then, to begin with, remember that Kraetzer-Cured lumber is made from large virgin timber of exceptional quality.

Besides Gum, we have Oak, Ash, Tupelo, and Cypress of a quality that is unsurpassed.

Write us today for the reasons why Kraetzer-Cured lumber is *different* and *better*. We guarantee every board.

According to officials of the Imperial Desk Co., Evansville, Ind., the European market for desks is showing signs of revivinng. This firm does a world-wide business and early in the year shipped a considerable proportion of its product to Europe, but the unfavorable exchange situation tended to check this business. With the solution of the war debt payment problem seemingly nearer, foreign buyers are again evincing an interest in desks made on this side of the water. Globe-Wernicke Co., and Kindel Bed Co.,

Claude A. McMurtry, a director in the Gold Medal Furniture Mfg. Co. Ltd., has recently been appointed assistant general manager. Mr. McMurtry was a Field Artillery Officer during the war, being gazetted from the Royal Military College, Kingston to the Royal Horse and Royal Field Artillery. He served in France continuously from 1915 till after the armistice and resigned his commission in November 1919 to enter the services of the Gold Medal Furniture Mfg. Co. Ltd.

The employees of the Canadian Blower & Forge Co., Limited, Kitchener, Ont., held their second annual picnic recently in Waterloo Park. A number of interesting sporting events were run off, including baseball, races and other similar numbers. Out-of-town visitors in the attendance included E. S. Wendt, Buffalo, N. Y., vice-president of the Buffalo Forge Co. and of the Canadian Blower & Forge Co., also George Neher, superintendent of the Buffalo Forge Co's. plant. The picnic was an outstanding success.

WHEN TO REPLACE OLD MACHINES.

By A. C. Kaufmann.

I was talking to one of the world's largest sewing-machine manufacturers the other day and the question came up: When should a machne be replaced by one that is more up-to-date and adapted to the work? His answer was—" By keeping up-to-date in the matter of machine equipment I find that we have been able to meet the enormous increase in our business without having to increase our floor space. The moderm high-speed machines not only require the same room necessary to the old slow moving ones, but increase capacity several times.

They also conduce to greater uniformity as one machine can do the work of several old type ones. Besides they're easier on the men. Many of our high-speed tools have automatic-feed and require little exertion on the operator's part. Had it not been for power-saving machines to increase the world's productive power, men would still have to toil from dawn until night to supply the bare necessties of life.

" But to get back to the point. I believe in making changes as they come without waiting until the old machines are being taxed to their utmost capacity. If your business has not doubled, but machine capacity has by all means install those machines which will do the necessary work in half the time. In this way half the time your operators could be doing something else, and this would bring a high interest on the money invested in new equipment.

" Take our case. We had 27 old style 6" stickers in operation on oak, Walnut and Gum, running on widths up to 4" and in lengths from one to two feet. On these old machines the operators had to handle each piece separately and give it an extra hard push at the start as the feed rolls had to be low in order to give proper tension and an effective feed. Our men worked piece work, feeding the stock at from 20 to 30 feet per minute for ten hours straight so you can imagine a man's arm and shoulder got pretty sore at the end of a day's work of that kind."

One mill, I know, runs four planers most of the time, day and night, one sngle sizer, two matchers used as surfacer and for S1S1E. Old machines, all of them. Matchers running at the highest only 80' vinced that the company could cut out the night crew kind, also loss tightening side head belts, because of lacing and no adjustable tighteners. With one of the old matchers thrown out and one new fast feed matcher with top and botom profiler installed, I am firmly con-more altogether than the old ont (and doing better entirely. I figure the new matcher would do 2½ times as much work as the present running, and ½ times as much through saving, in changing. Doing three times more altogether than the old one (and dong better work besides) it would mean as much as two more old type machines, which is about all running on the night crew. The night crew consists of one fireman, two feeders, two offbearers, two loaders, about $28.00 a night outside of saving in belting, light, grease for engine and planers and line and shafting and fan, etc.

However, the new machine would necessitate say two men more on the day crew to take proper care ot bringing stock to the machine and pushing out of the finished product. Come to thnk that three times more output is almost too low an estimate when I see that even with 1 x 12 the daily output per machine is between 16 and 20 M ft.,

In any event, if the company is intending to run for a longer future period, it would pay I think, to install a fast machine, which ought to pay for itself in almost a year.—" Yate's Quality."

Pointers on Knife Grinding

Always caliper each end of knife before clamping it fast. Some cases when one end is wider, set that end out far enough to equalize it in the grinding; if one end is wider than the other it throws head out of balance. It is a hard job to try to keep thin knives straight in the clamp and the operator who sets the knives must spring them some in the head.

Great care should be taken in selecting the proper grinding wheels with proper qualities for that particular work and keep this wheel free from glaze with a wheel dresser or by chipping it off with a piece of steel. Chipping the wheel aids it in cutting with less heat and naturally saving the temperature of the cutting edge of knife.

When ordering a grinding wheel, give dimensions, the speed, and whether it is to be run wet or dry; the kind of knives to be ground should be also given.

A round gullet in the tooth prevents cracks coming in the saw.

One of the most essential things for a country's prosperity is very cheap power.

Round cutter safety heads are now made to cut with the same angle as square heads.

Large pulleys, while weighing more upon the bearings than small ones, reduce the slip of the belting to a minimum. They are better than dope for ensuring certainty of action.

VENEERED PANELS

FOR KITCHEN CABINETS DRAWER BOTTOMS, Etc.

PLAIN OAK and MAPLE

We can furnish panels for kitchen cabinets, phonograph cabinets, drawer bottoms, furniture, etc., in plain Oak and Maple. Prices on request.

Panels are also made in Walnut, Quarter Oak, Basswood, etc. Large sizes (72x24; 60x30; 60x24; 56x25; 60x20; 60x18; 48x18) carried in stock at all times.

Enlarges Scope of Engineering School.

Princeton has given an undergraduate course in civil engineering and a graduate course in electrical engineering for many years. Next fall undergraduate courses in mechanical, electrical, mining and chemical engineering will be added to the curriculum. A four-year course will lead to the degree of B. S. in engineering and is designed to meet the needs of the student who does not expect to practice the profession of engineering, but wishes the engineering training to fit him for business or manufacturing. For those who decide to follow engineering as a profession an additional year of special work in the chosen branch will bring the engineer's degree. The establishment of the new courses has been largely due to the efforts of certain of Princeton's engineering alumni through the graduate body known as the Princeton Engineering Association.

Prof. Arthur M. Greene will become head of the Princeton Engineering School in 1922.

Construction of National Road.

It is reported that work has been started on the construction of approximately 6 miles of improved surface roadway from the "Casino" at Panama City to Old Panama. The amount of the contract is approximately $275,000, and the work has been contracted to be completed in four to five months' time. The portion of the road from Panama City to the Sabanas is subjected to the greatest amount of traffic and is to be constructed of concrete. The remaining portion from the Sabanas to Old Panama is to be built of an asphalt wearing surface on a macadam foundation. The roadway will be about 20 feet in width. This is a continuation of the road-building program started by the Republic of Panama about the beginning of the present year, and is the third award which has been made since that time.

The Jamaican Government plans the improvement of Kingston harbor at a cost of $5,000,000, and hopes to attract the ships passing through the Panama Canal Vessels from New Zealand, Australia, Tasmania, and the ships of the Canadian Government Mercantile Marine coming to Jamaica have been exempted from tonnage and lighthouse dues from 1921 to 1923, inclusive.

END PILING OF MOULDING.

End storage ot moulding is becoming more popular, as it is claimed that this method has many distinct advantages over any other. A light tap of moulding stored on end will cause dust to slide off. Furthermore moulding so stored is more easily, quickly and cheaplyy handled, and a piece of any length can be picked out at a glance. The greatest objecton to end storage is that it is likely to cause more warpage than flat storage. Warpage in small storage is not serious, but warpege of heavier stock somtimes causes regrettable loss.

Warpage can be greatly lessened by proper piling and by seeing that the moulding is not slanted too much in the bins. In other words moulding should be stacked as nearly upright as possible. Warpage can be practically eliminated by bulding up solid backs for the moulding rack or even by running boards across to provide backing. Shiplap or ordinary sheeting lumber will do for this purpose.

It is very easwy to construct rack for the end storage of moulding provided sufficient space is available. The heght of the room must accomodate the longest lengths carried. For each pattern shere should be a separate bin or pocket. Usually bins two feet wide by six feet deep will be sufficiently large for an ordinary retail stock.

Whoile the end storage of moulding mitigates damage from dust, it is always best to store moulding in a dust proof-room equiped with doors opposite each mouldng alley. This room should be dry and well ventilated. Each bin should be numbered and beside each door on the outside these should be a sample of every moulding in the particular alley. Beside each samule should be set a bin number, so that it is possible to tell at a glance the bin in which any desired pattern is stored.

A GOOD BUSINESS POLICY.

The creed as adopted by the National Association of Purchasing Agents should not be confiined to members of any one organization but could be adopted and practised with profit by anyone engaged in any field of endeavour. In our modern business life too little attention is given to the ideals and feelings of others. Let us adopt a more tolerant attitude in all dealings with our fellow man.

I believe absolutely in honesty and sincerity—in thought, action and deed.

I believe it is my duty to elevate the standards of my profession by study and service.

I believe in the ideals embodied in the Golden Rule—"All things whatsoever that men should do unto you, do you even so unto them." Therefore, I believe in courtesy and good will toward all.

I believe in the "square deal" toward the company I represent, with myself, and toward the men with whom I do business.

I believe it is the duty to refuse and renounce gifts or perquisites from those with whom I transact business.

I believe in enthusiasm, progressive methods, and success; in the exchange of ideas and association among fellow purchasing agents and in fulfilling all my obligations like a man.

The safety valve that always passes a certain amount of steam requires "grinding-in."

LONDON ONTARIO

Opportunity for Young Men in Big Business

Head of the Westinghouse Company Demonstrates How Hard Work Brings Results—The Example of Samuel Insull

Preparing oneself for opportunities to be ready when they come was the theme of the address of General Guy E. Tripp, chairman of the board of directors, Westinghouse Electric & Manufacturing Company, at the commencement exercises of the Westinghouse Technical Night School a few weeks ago. He told how one man prominent in the electrical industry, Samuel Insull, took advantage of learning more by doing more work, and what resulted from his effort. General Tripp said further:

"There never was a time when such a young man with loyal instincts had so many opportunities as at the present time.

"I have spent many hours on different occasions in conference with others trying to select young men for responsible positions both within my own company and outside. It is more difficult to find such men than you imagine.

"In the first place, while we know that there are many of them, we unfortunately do not know who they are. They have not yet attracted wide enough attention to be known beyond a comparatively small circle.

"Then, again, there are too many who have got a wrong start, a wrong attitude of mind, whose daily actions are based solely upon selfish considerations. However able such a young man may be, those who are responsible for the selections for important positions fear to run the risk that he would change his outlook upon life and become loyal to a trust for others; there much ability is wasted in unsuccessful and ultimately discontented men.

"However, these are all generalities and it doesn't do to generalize too much. When all is said, the fact remains that men usually select themselves for higher positions and I can best illustrate that by reading to you from an interview by Mr. Samuel Insull of Chicago, who is not only the dean of the electric light and power industry, but is also one of the outstanding successful men of America. Mr. Insull began his business life in London and he describes his own experience as follows:

" 'I had answered a "blind" advertisement, and, as a result, had secured a position as secretary to Mr. Edison's business representative in London. I had come into the business without any knowledge of either the technical or the commercial side of it.

" 'What prepared me rather quickly for a better place, and attracted the attention and support necessary to get it, were two pieces of work outside of my regular duties.

Chances for Advancement.

" 'The first chance came only a few weeks after I had taken the job, when my chief sailed for the United States and left me behind. There was not much to be done in the office, and I might have had most of my time free. In fact, it was expected that I would. But thanks to an immense curiosity about the business, I didn't; I stayed in the office and read, and re-read, every document I could lay my hands on.

" 'When the chief came back I was able to supply him with information on current affairs and even on things which had occurred before I came with the business. And I could relieve him of more work than he had expected I could. It had all come about in the simplest possible way, that would have been open to anyone; yet it made a considerable impression on him.

" 'The second outside task—of course, there were other smaller ones in between—came a year or so later. Mr. Edison's technical representative in London was getting out a report on electrical developments in England and on the Continent. He wanted a stenographer to work with him evenings, for perhaps two months, and he asked me if I couldn't find one for him.

Hard Work Brought Results.

" 'By this time I had become fairly well informed on the commercial side of the business, but on the technical side I was still pretty ignorant. It struck me that here was my opportunity to brush up on that side, and I volunteered for the job.

" 'It was hard work. It kept me busy often until midnight, on top of unusually active days, as it turned out. But it brought quick results.

" 'This is they way they developed. The technical man went to New York with his finished report. While he was away he wanted someone in the London office to keep posted on certain European properties in which he was interested, and to send him weekly reports. I was chosen to do it. I was chosen simply because of my familiarity with the properties, and with the requirements of this technical man, which I had gained from my evening sessions with him as a stenographer.

" 'In the ordinary course, the weekly reports were shown by the technical man to Mr. Edison. There was nothing elaborate or difficult about them. They were simple compilations of certain data, which my work with the technical man had made it easy for me to prepare. But they showed a familiarity with the properties, and with other details of the business, that Mr. Edison liked. It happened that he himself was needing a secretary at the time. He asked the technical man about me, and then sent for me.

" 'You see how directly one of the unnecessary tasks brought the opportunity; how the two of them together had prepared me for it; and how impossible the opportunity would have been but for my undertaking those tasks, no matter what sort of natural ability I might have had. As a matter of fact, the real opportunity was not the call from Mr. Edison, but the chance at those bits of outside study and work. And there are similar opportunities opening up from every job.

" 'I found them again when I became Mr. Edison's secretary, although it was not so easy to take advantage of them. The actual requirements of the work were stiffer. The night I landed in New York—I got there about six in the evening—I called on Mr. Edison immediately, and worked straight through with him until four in the morning.

" 'That was unusual; but even under ordinary conditions there was a good deal of overtime work. Mr. Edison was as likely to be in his laboratory at midnight as at midday. Often the most convenient time for him to attend to his business affairs was after he had finished in the laboratory. It was not uncommon for me to spend the day in the office in New York and then go down to his home at Menlo Park, in New Jersey, for a session with him at almost any hour of the night.

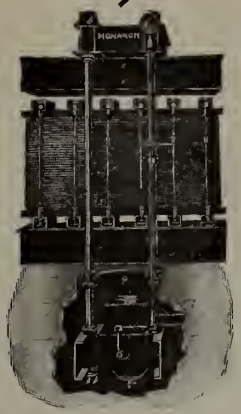
Farquhar Hydraulic Machinery



Monarch Veneer Presses

Farquhar Hydraulic Veneer Presses have double steel head and base, and heavy steel strain rods. Cylinder, which is of steel with detachable saddle, can be repacked without removing the ram. Pump is quick acting, of rigid construction. A pressure of 100-lbs. to the square inch is applied to the veneering surface. Stock is handled by retainer system, unsurpassed both for efficiency and economy.

These presses are built to suit all requirements, liberal proportions with first quality material and workmanship throughout.

We make a specialty of Pumps, Accumulators, Etc. Also all kinds of special Hydraulic Presses and equipment to order. Write us concerning your requirements.

There is supreme satisfaction in Garnet Cloth and Paper you can believe n - which you know will run true and smooth, giving a finish that every good workman demands.

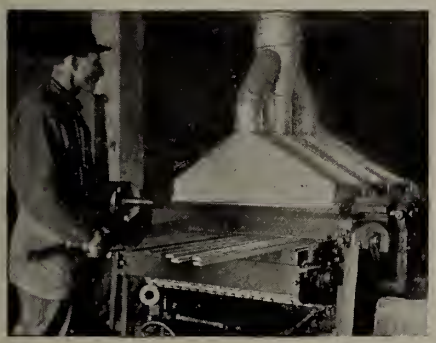
Carborundum Brand Garnet Paper and Cloth

are made of the very best material coated with North River Garnet which cuts fast and uniform.

A complete stock of sheets and rolls in all standard widths and grades carried here.

NORMAN MACDONALD
62-64 Temperence Street TORONTO ONT

The Cleanliness and Purity of Carborundum Brand Garnet



GARNET grain must be clean and pure. It must be free from dust, dirt, iron and other impurities. If it isn't, your garnet paper or cloth fills up—it clogs. The result is that it cuts slowly, leaves a most uneven finish.

Carborundum Brand Garnet is clean—it's pure—it's uniformly graded. There is no dirt—no impurities—no fines. That is why Carborundum Brand Garnet Paper and Cloth cut so clean, so fast, and show such long life. Other reasons are found in the fact that the backing is of the highest quality—the glue of the best grade—the method of manufacture the most modern and approved.

Carborundum Brand Garnet Paper and Cloth

Will Make Good Sanders Better Sanders

PLANER KNIVES and CUTTERS

OF ALL DESCRIPTIONS

The Peter Hay Knife Co., Limited

GALT, ONTARIO

A KILN is as GOOD as its PROCESS— plus its EQUIPMENT— plus the SERVICE of the MAKER— plus the ORGANIZATION back of it all—

OUR PROCESS assures the control of the three fundamental factors—HEAT—HUMIDITY—CIRCULATION.

OUR EQUIPMENT is guaranteed complete, sturdy in construction, simple in its installation, economical to maintain.

OUR SERVICE is the broadest—engineers for layouts, building designs and operation—superintendents for erection and installation—experienced woodworkers for consultation and service during the life of your kiln.

OUR ORGANIZATION has been composed of woodworkers for thirty-five years, men who know wood and have handled it through the complete range of manufacturing operations.

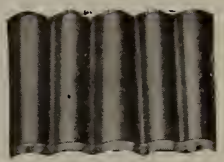
Cary's SUPERIOR QUALITY Corrugated Fasteners

SAW EDGE



PLAIN EDGE

According to final decision, after long litigation, we have been granted the SOLE RIGHT to manufacture a Saw Tooth Corrugated Fastener with a continuous cutting edge. Our fastener is beveled evenly on both sides, which enables fasteners to be driven in straight, and much easier than any other fastener made. Our Corrugated Fastener is made in various widths and corrugations, also in coils wound right and left. Try our products and you will use no other.

Samples and prices on request.

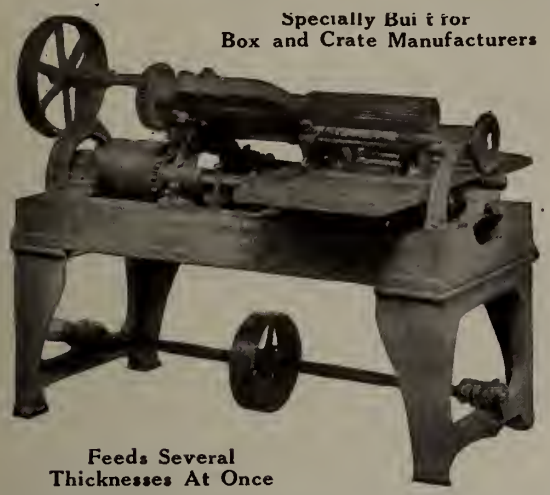
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier

For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.

STARTED right with the finest nickel alloy steel and made mechanically right by expert saw makers Simonds Band Saws have long been recognized as leaders in woodworking shops. They hold their tension and retain their cutting edge longer.

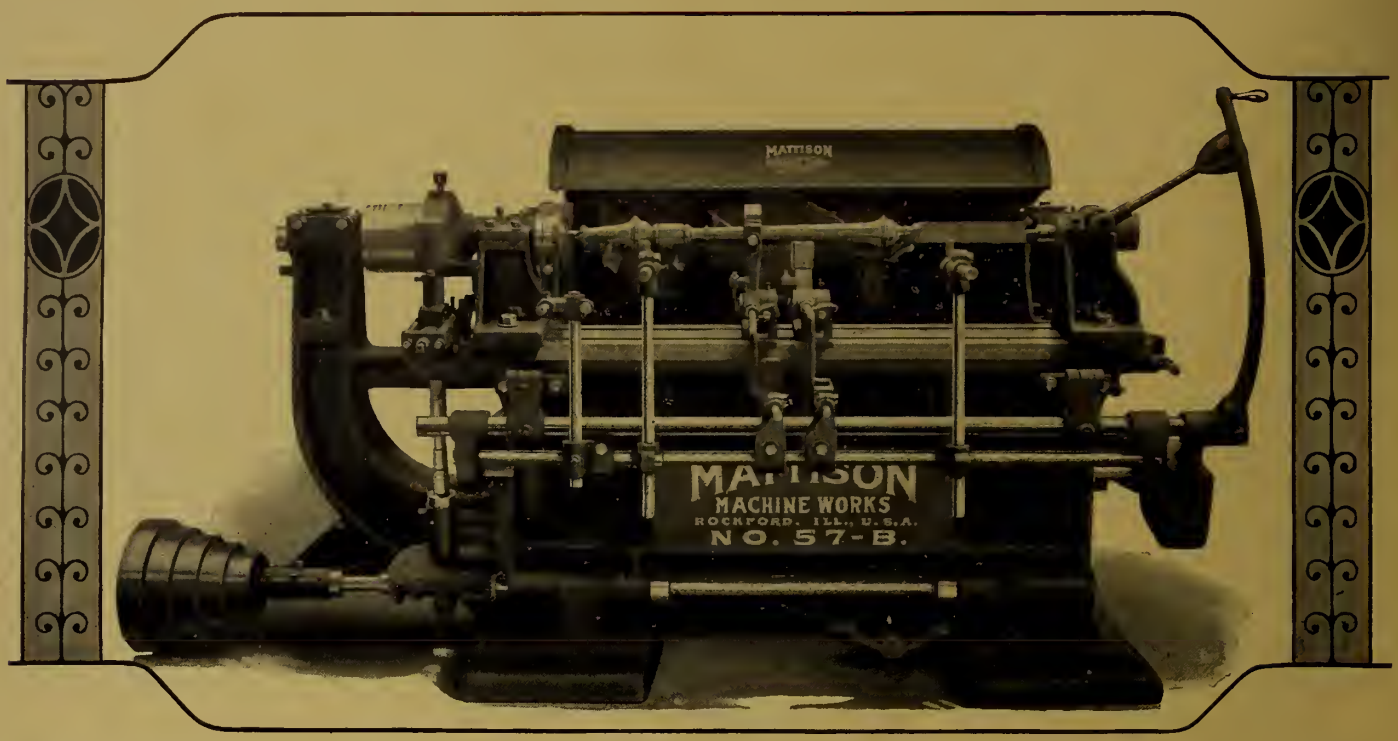
MATTISON
Automatic
The Standard Shaping Lathe
OVER 3000 IN USE



New Styles Demand More Turnings

The Mattison Automatic Shaping Lathe produces turnings much faster and cheaper than is possible with hand methods or with old style machine equipment. But of even greater importance is its flexibility which gives your designer free play in creating his designs. It faithfully reproduces all the historic round, square and octagon turned work, which plays so important a part in the new, distinctive patterns of today

If it is worth while to bring out new patterns, isn't it just as important to give equal consideration to the best and most economical method of producing those patterns?

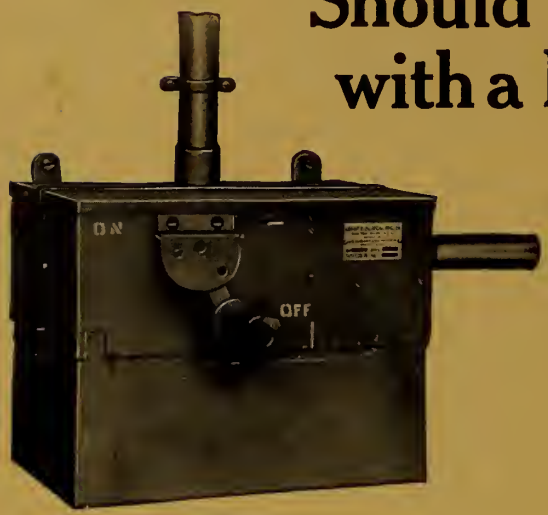
CONDIT

No Power Circuit Should be Broken with a Knife Switch



Condit Type N-2 Oil Switch

Condit Type 1 Oil Starter

By using Condit Oil Starters and small industrial Oil Switches to protect small motors and small power and lighting circuits in woodworking plants, the fire hazard is eliminated and many delays caused by trouble with small motors not properly protected, is avoided. When a circuit is opened, the arc is under oil which immediately extinguishes it. Thus, serious trouble very often caused by knife switch blades burning in ways which prevent proper contact and allowing a three phase motor to operate on single phase, is obviated.

CONDIT: *the Synonym of Safety in Electrical Protective Equipment*

Andrew Carnegie says

in his autobiography:

"It is surprising how few men appreciate the enormous dividends derivable from investment in their own business. There is scarcely a manufacturer in the world who has not in his works some machinery that should be thrown out and replaced by improved appliances; or who does not, for the want of additional machinery or new methods, lose more than sufficient to pay the largest dividend obtainable by investment beyond his own demand."

If you need additional machine equipment or are i nterested in the latest improved machines, write us.

A few machines offered from stock are listed below:

1—McGregor-Gourlay Double Arbor Universal Saw Table, same as C.M.C. No. 618, with 14" saws, self-contained countershaft, full complement of gauges, saws, wrenches, etc.

1—Preston No. 127 Variety Saw Table, countershaft attached, one 14" saw.

1—Ballantine 36" Band Saw, with solid lower wheel, complete with saw blades, wrenches, etc.

1—Ballantine Two Spindle Shaper, Spindles 20½" centres, diameter of spindles where collars go on 1⅛", top 42" x 42".

1—American No. 1 Single Spindle Shaper. Fig. 937 with plain countershaft.

1—C. M. C. No. 507 Mortiser, with boring attachment.

1—C.M.C. No. 624 Hand Feed Rip Saw Machine, with self-contained counter shaft, table 6'6" long by 40" wide, with plain box gauge, 22" saw blades, 1¼" arbor with cone for receiving saws different diameter.

1—Ballantine 8" Four Sided Moulder, complete with square heads and straight knives on all heads.

1—American No. 2½ Single End Tenoner, with two copes and cut-off saw attachment. Fig. 9431 in American Woodworking Machinery Catalog.

1—C.M.C. No. 646 Roller Table Cut-off Saw, sliding table 7'6" long. stationary table 50" to the saw, sliding table equipped with stop gauge, including five stops, with countershaft, complete with saws, wrenches , etc.

1—Cowan Combination Vertical and Horizontal Boring Machine, complete with wrenches, etc.

1—Hespeler 12" Buzz Planer, fitted with round cylinder, full set of knives, countershaft, wrenches, guard, etc.

1—Preston 36" Band saw, lower web wheel and guards.

8—Sections Cowan Four Screw Veneer Press 12"x50", four sections 27" clear space under screw plates, four sections 32" under screw plates.

1—24" Francis Double Roll Glue Spreader.

4—Sections Cowan Three Screw Veneer Press 38"x12", 28" clear space under screw plates.

1—C.M.C. Arm Sander, No. 438, with paper cutter.

1—Universal Knife Grinder, 37", made by American Wood Working Machinery Co., Fig. 1126 in their catalogue.

1—60" Sturtevant Single Slow Speed Exhauster, left hand, top vertical discharge, complete with platform and rods to suspend from ceiling.

1—Cowan Chain Mortiser with grinder.

1—Ballantine 36" Band Saw, lower web wheel.

1—American No. 3 Double Cut-Off Saw, new machine, capacity from 8" to 6' 9" in length, 4" thick and 30" wide.

1—American No. 25 Edging and Ripping Saw, new machine.

1—American No. 30 Double Arbor Universal Saw Bench, new machine.

1—Preston 24" No. 121 Pony Planer, used only couple of months.

1—McGregor-Gourlay 24" Pony Planer.

1—Mershon Band Rip Saw.

SPECIALS

1—Morgan Two-Arm Shock Fastener, used machine, but in firstclass condition.
1—Used Morgan Eight-roll Box Board Matcher.

An Open Letter to Railroad Men on the No. 171 "Lightning" Timber Sizer

Facilitate the car shop with the new developments of this Sizer.

"The Lightning" Line
TRADE MARK REG.

Mr. Railroad Man:

In order to meet the increased demands made upon your woodworking shops, production must be speeded up to the limit.

You cannot speed up production on an old-style Planer and Matcher. Discard that slow and out-of-date machine and install this new efficient fast-feed Planer, Matcher and Sizer.

Made to work 20″ or 30″ wide and 14″ thick. All adjustments are quickly and easily made, particularly in changing for different classes of work.

It will pay you to investigate this modern fast-feed tool.

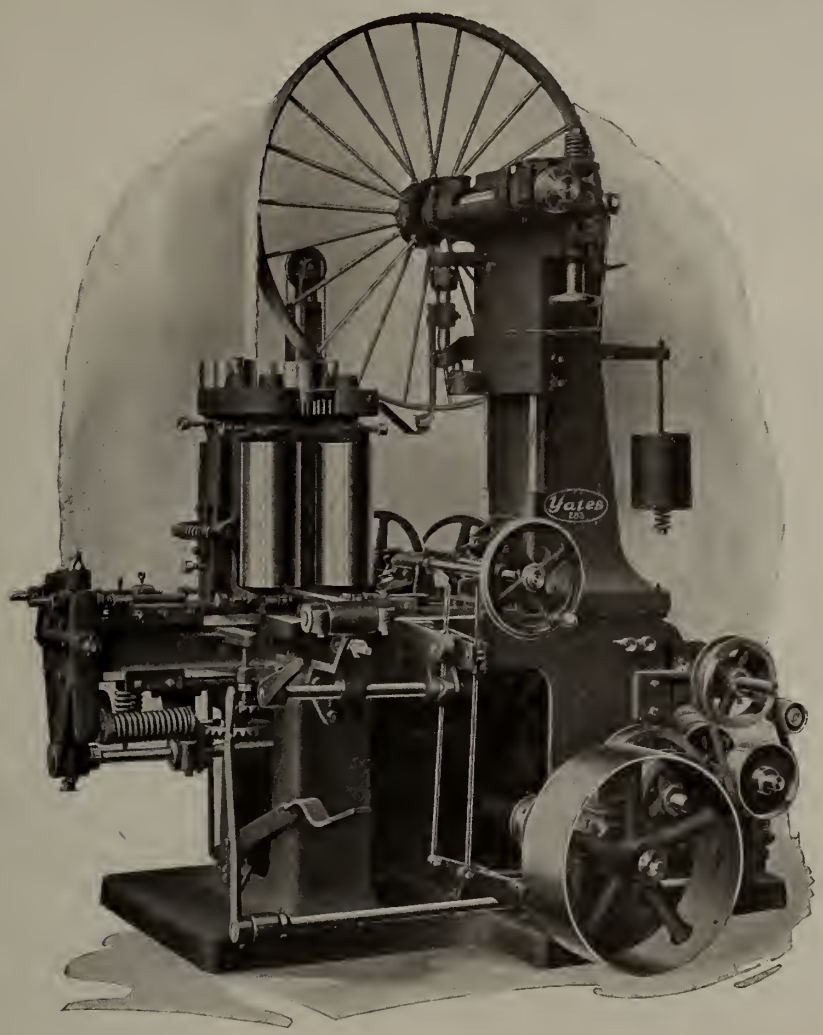
"Setting the Pace"



Yates

No. 283 Band Resaw

For Lighter Resawing in Furniture Factories

Where fine and accurate work is absolutely necessary the "283" for turning out this class of work has "set the pace" for many years. When it comes to "finish" it leads them all. One user says "The finish has been all that we could desire."

Have you seen the Yellow and Black Circular ?
Sent gladly upon request — No obligation.

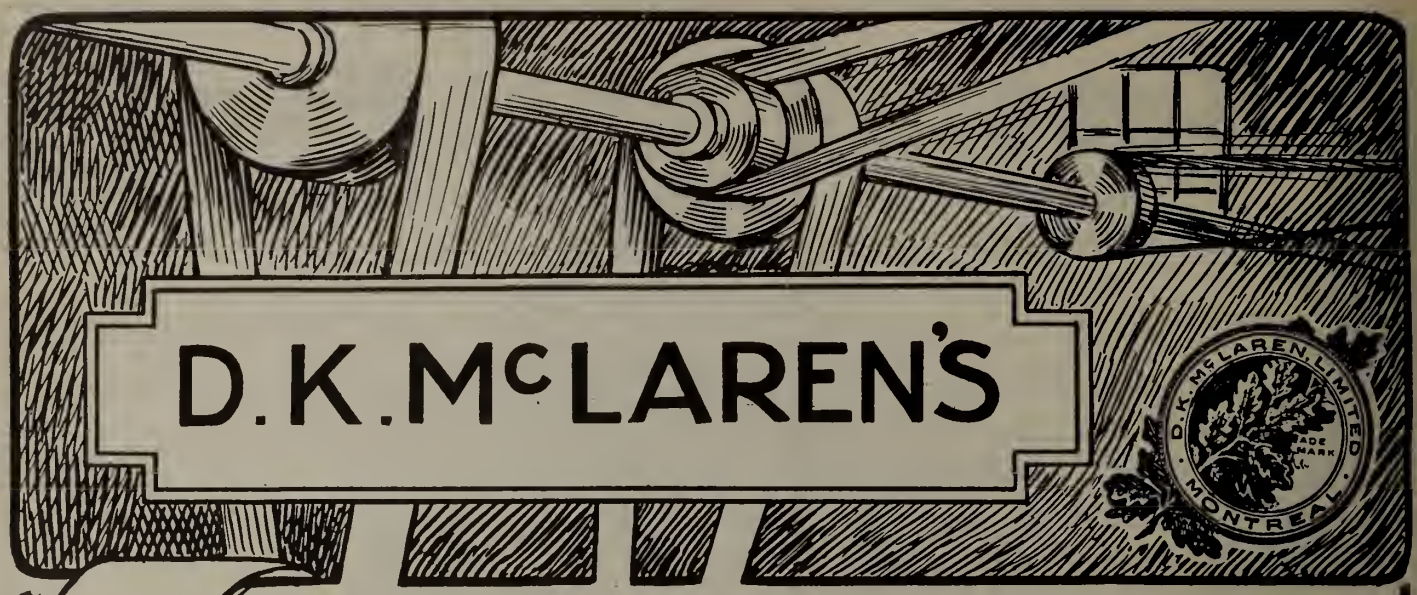
Hamilton - Canada



Genuine·British·Oak·Tanned LEATHER·BELTING

POWER is expensive-too expensive to waste. And yet that is what hundreds of belting users are doing when they employ a belt that is continually stretching and slipping.

The small difference in the cost of such a belt and D. K. McLAREN'S GENUINE BRITISH OAK TANNED LEATHER BELTING is quickly swallowed up in the wasted power for which the cheap belt is responsible.

Do not be misled. Cheap belts are not cheap. They are expensive. Let's talk it over!

D. K. McLAREN, LIMITED

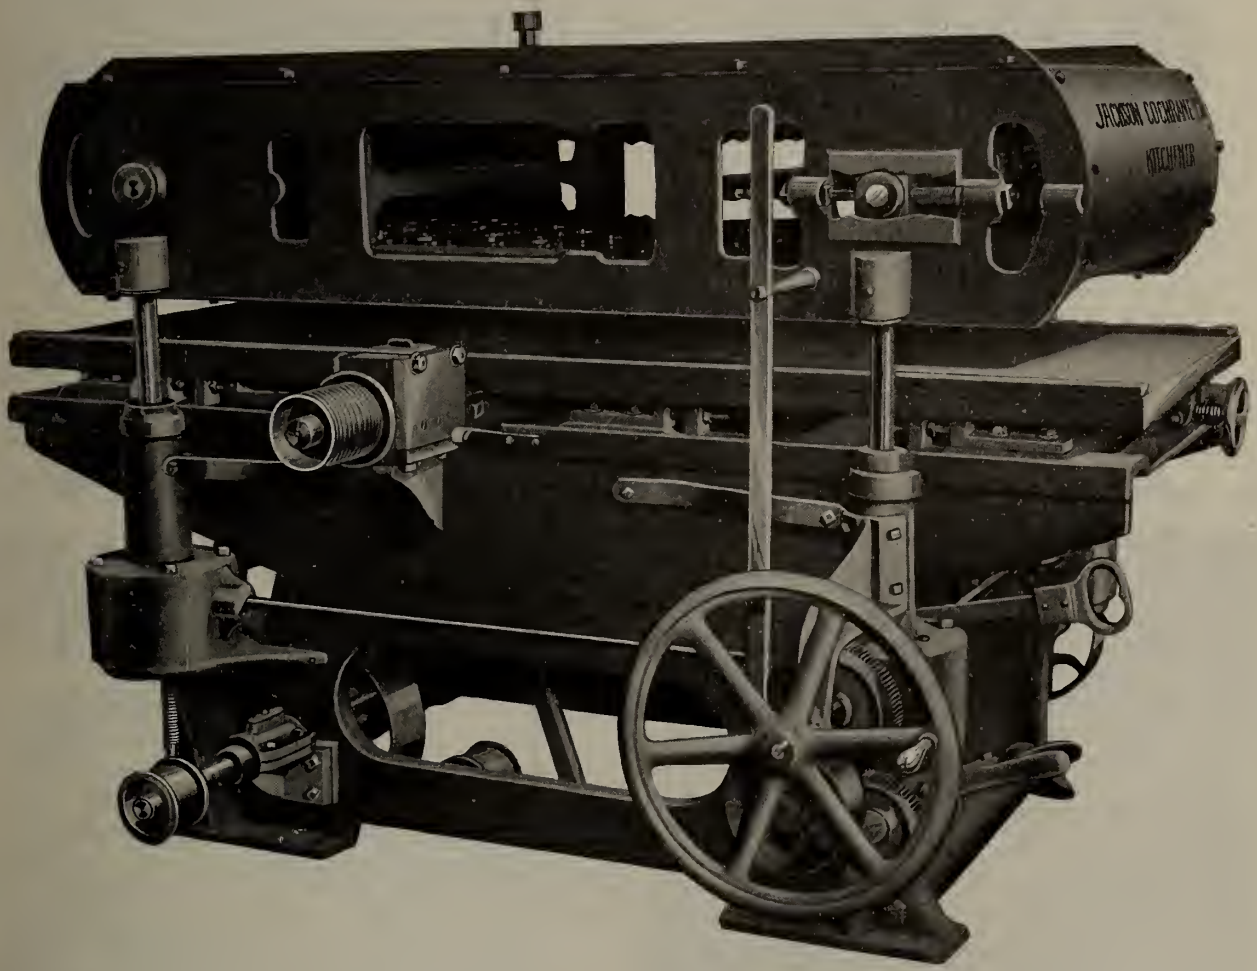
The Herzog Self-Feed Jointer

means

Increased Production **Simplicity of Operation**
Small Floor Space **Safety to Employees**

Does four times the work of the Hand Jointer



Our No. 34 Herzog Jointer, illustrated above, is one of the most efficient machines on the market to-day. It is appreciated by the manufacturer and employees alike, because, while it will produce from three to five times as much work as the hand jointer, it does not require skilled operators, but eliminates the danger so common to other makes. It can be operated by two boys. It will handle stock varying in width from 1 inch to the full width of the jointer, will feed fast or slow, takes only one-fourth the floor space of hand jointers, and requires only one-fifth of the sharpening of the knives. It is fitted with power feed raising and lowering attachment, with cylinder double belted and driven from both ends.

If interested in reducing your costs, write us

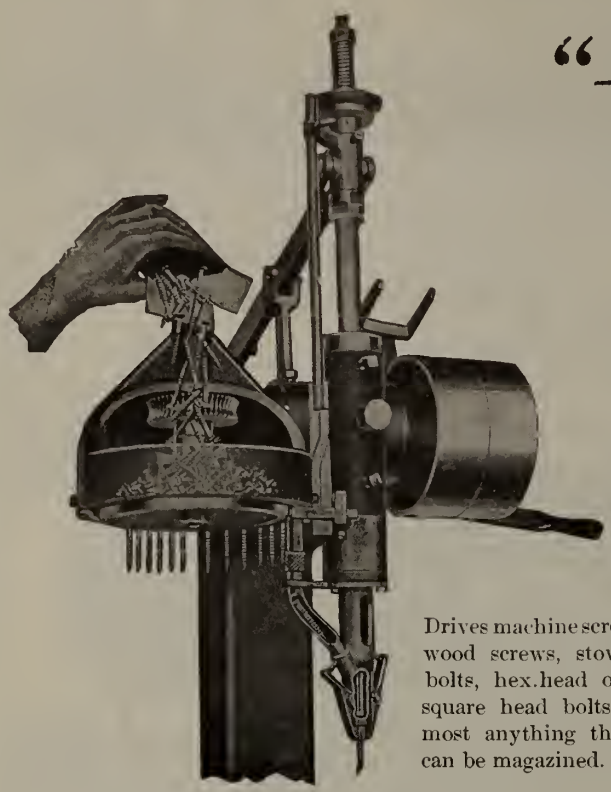
KITCHENER - CANADA



Drives machine screws wood screws, stove bolts, hex.head or square head bolts, or most anything that can be magazined.

"—and the machine does the rest"

This unique piece of mechanism is revolutionizing the operation wherever installed. It is an important part of almost every up-to-date woodworking plant on the continent.

The
Reynolds Machine Co
Department C.
Massillon, Ohio, U. S. A.

BOX-MAKING UP-TO-DATE

Box-making is an important, though only one, use to which Robertson's "Recessed Head" screw is best suited.

The advantage of this screw—greater rapidity in driving, less chance of slipping, elimination of splitting, etc., are well known to the operator in the photograph. In this instance he is shown running a Reynolds Automatic screw-driving machine. This combination, he declares, has resulted in a marked increase in production.

Drivers and Bits to fit and style power machine, or ratchet driver free with first order.

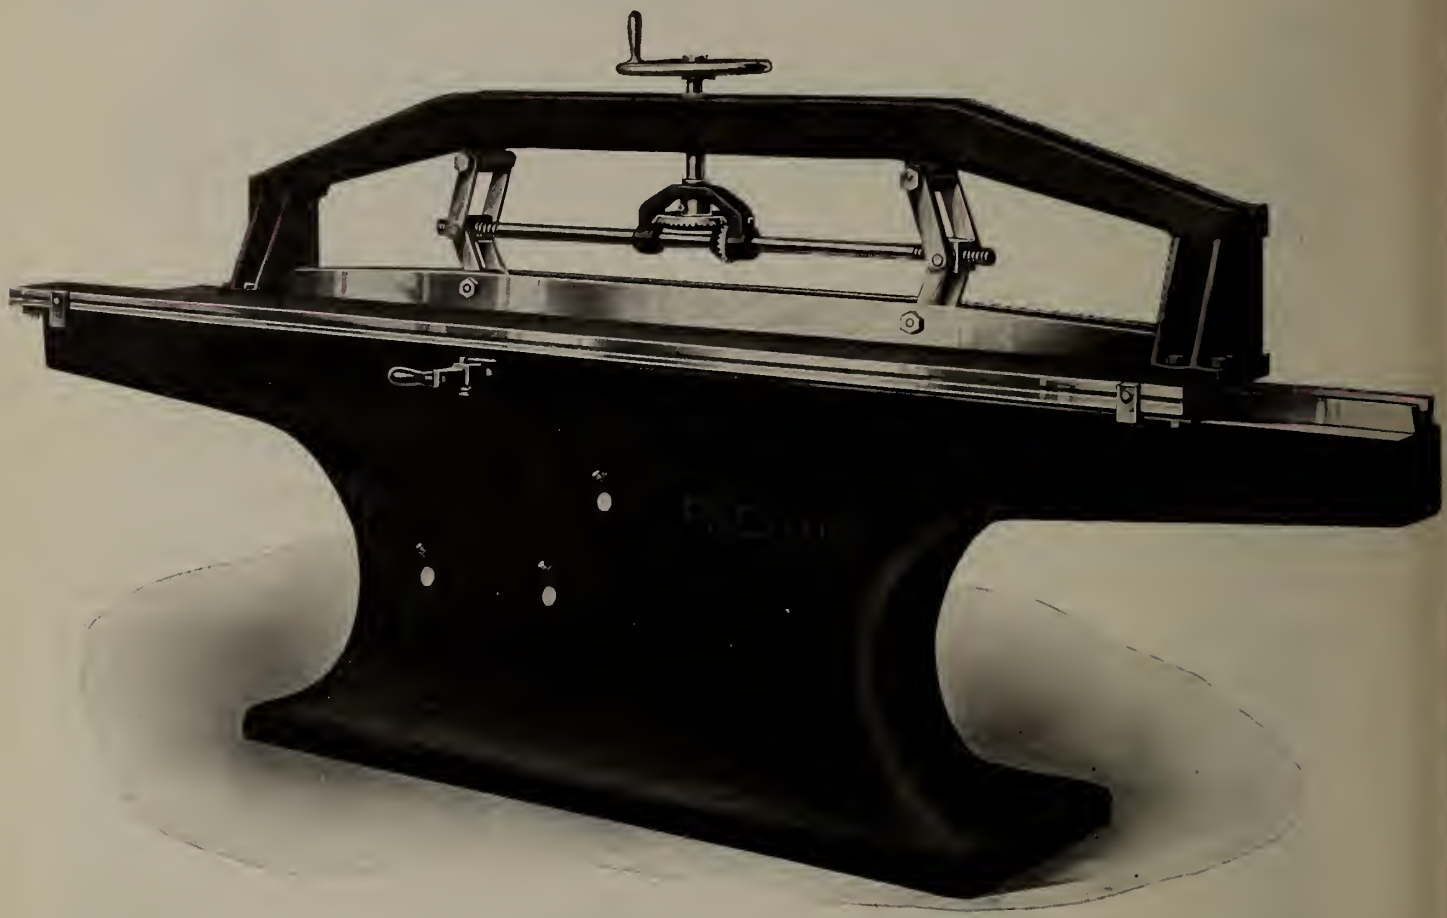
The Preston Veneer Jointer has many exclusive features



Designed for the purpose of making commercially perfect face joints, butt or crosswise, as well as lengthwise of the grain on the highest figured Circassian Walnut or Crotch Mahogany Veneer.

As rigidity is an essential feature of this type of machine, special care was taken in its construction. The frame, which is of cored section, is cast in one solid piece.

It is the only machine that will effectively joint buckled veneer.

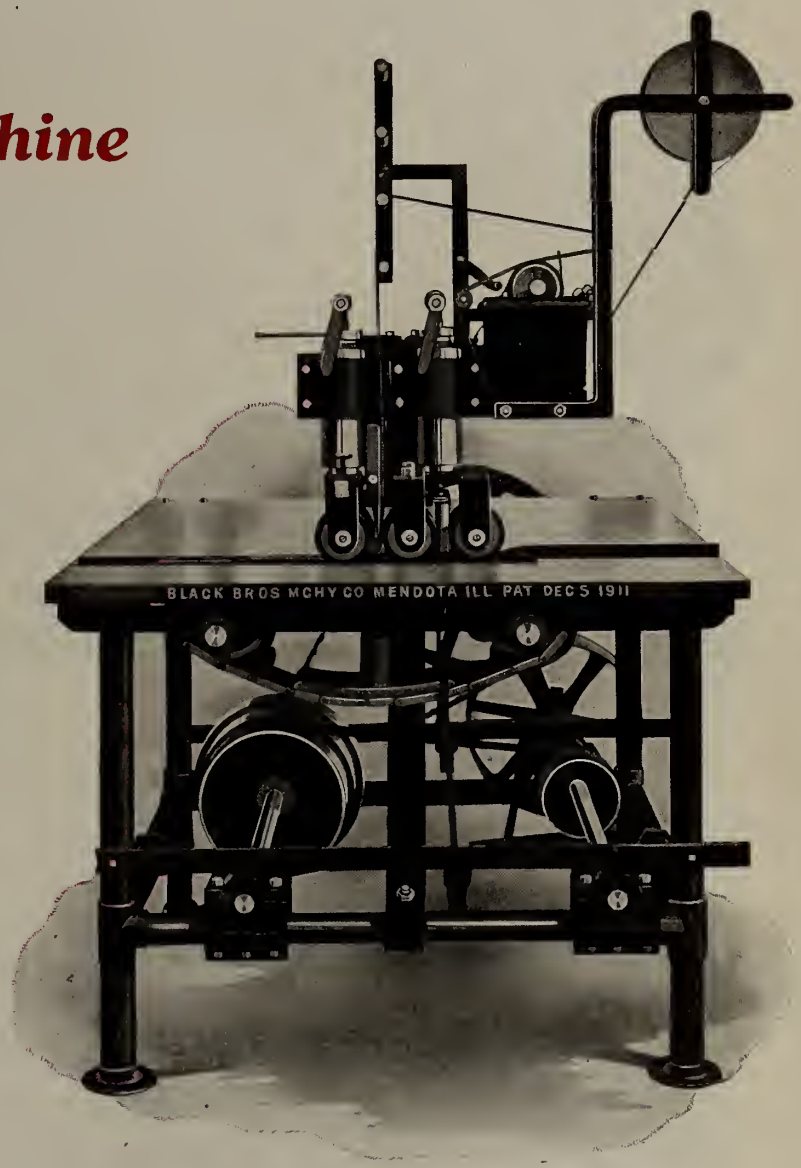
We are the Sole Manufacturers and Agents in Canada of the Eaglesfield Patented Beltless Swing Saw

This Machine is just what you Need in Your Veneer Room

The "Black Bros." Veneer Taping Machine



Any machine that will increase the output of your plant without adding to the overhead is surely worth your consideration. The Veneer Taping Machine here illustrated does this to an unusual degree, hence its popularity throughout the length and breadth of the woodworking industry. So sure are we that it will win your approval that we will instal it on trial. You can be the judge.

In operation it will handle with equal speed veneer of any thickness, using the ordinary gum tape or plain tape and applying its own gum or glue as it is used.

Built in two sizes—24 in. and 36 in.

The Shimer Round Safety Cylinder with High Speed Knives

A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

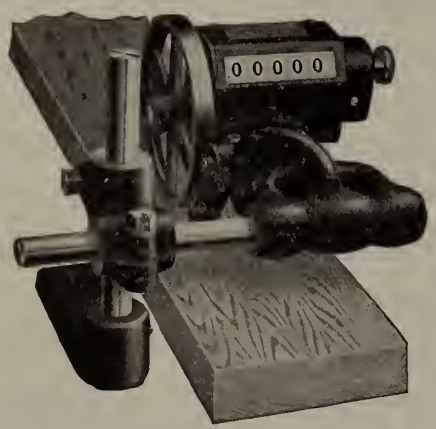
If made of hide for mechanical purposes we have it

Almost Human— In a Measure



The Productimeter

Men will sometimes guess when making estimates—or when measuring lumber.

This little automatic machine, easily applied to moulders, matchers, stickers, self-feed rip saws, etc., does not guess, lose count or "lay down" on the job. It measures every foot of lumber that passes, and gives you instant, accurate, reliable figures to base your estimates and costs, without guessing. Works honestly—doesn't need watching.

Send for catalog. Or tell us what machine you want to check up on and we'll send you the Productimeter on 30 days' trial.

Durant Manufacturing Co.

615 Buffum St. Milwaukee, Wis.

(1230)

The Berry Combination Band and Circular Automatic Saw Sharpener

Belt or Motor Driven. Capacity: Bands, 3-16" to 4", Circulars 4" to 32". Simple, Universal, Automatic in Action.

It is the only *combination* grinder that is *automatic*

It is the only grinder that will grind a saw absolutely round after three months continuous use—without readjustment or rebabbiting. It will take an unevenly spaced, hand-filed saw and make it perfectly round and even spaced. No other machine will do this.

For All Shops Using Circular or Band Saws

The Berry Tooth is far superior to the ordinary peg tooth. All teeth are alike, evenly spaced—ground right from the center. A saw ground with this machine does twice the work in half the time.

Write for Booklet to-day.

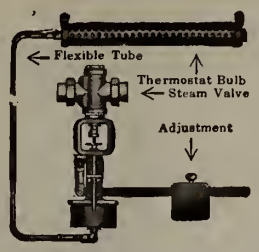
Man's Mind Makes Mistakes



The Powers Regulator No. 15
Specially adapted for control of air temperatures in leather dryers, ovens and kilns. Write for Bulletin No. 138. There are other Powers Regulators for other places—acid baths, hot water tanks, etc.

Wherever there is need for maintaining a definite uniform temperature —as in drying rooms, ovens, vats, kilns, etc.—men may forget—but machines cannot. You depend on your men to watch the temperatures, but they are only human and, as careful as they try to be, they have sometimes allowed valuable hides to be spoiled.

The Powers Automatic Heat Regulator

Built scientifically in accordance with known physical laws. Self contained; entirely automatic; can be adjusted to maintain any desired degree of heat; stays on the job every minute and does not **forget to** "turn 'er on" or off when the temperature even **approaches** the danger point. Prevents loss and damage and worry. Set the Powers Regulator and you can **depend** on results.

Perkins Vegetable Glue

The Picture Shows The Present Home of

PERKINS 183

TRADE MARK (Reg. U.S. Pat. Off.)

The Solution to All Glue Room Troubles

We will not lower the standard which we ourselves have set and you cannot afford to use anything but the best. Labor costs for poor glue should go into glue costs. Add to your Vegetable Glue Costs your labor bill for allowances on returned goods on account of defective glue; divide that by your output and your "glue line" cost looks different. Add to that cost the indeterminate figure represented by factory troubles and "general irritation" and you will decide that good old PERKINS 183 is the best in the long run.

Process and Product Patents covering PerkinsGlue were granted July 2nd and March 19th, 1912, and have been held valid and infringed by the United States Circuit Court of Appeals. Patents have also been granted in Canada, Great Britain, France, Belgium, Italy and other foreign countries.

ECONOMY AND RELIABILITY GOES FAR

LACTOCOL

STANDS THE STRAIN

THE COLD WATER GLUE
IN POWDER

REQUIRES NO HEATING OR RE-HEATING. PREPARED IN A MOMENT BY MIXING AN EQUAL VOLUME OF COLD WATER WITH THE POWDER. YOUR GAS BILL BE HALVED AND YOUR OUTPUT CONSIDERABLY INCREASED BY USING LACTOCOL, THE GOVERNMENT APPROVED GLUE.

LACTOCOL IS SPECIALLY ADAPTED FOR GLUEING LARGE SURFACES, AS IT DOES NOT SET PREMATURELY LIKE CAKE GLUES. IT CAN BE USED FOR THE MOST DELICATE OPERATION OR FOR THE LARGEST WORK WITHOUT THE POSSIBILITY OF FAILURE.

ALL JOINTS MADE WITH LACTOCOL ARE WATERTIGHT AND UNAFFECTED BY HEAT. IT IS GUARANTEED TO WITHSTAND A STRAIN OF CONSIDERABLY MORE THAN 1,000 LBS. PER SQUARE INCH. IT SETS HARD AND THE JOINT IS STRONGER THAN THE WOOD. LACTOCOL IS EASILY APPLIED, GOES A LONG WAY, AND IS PERFECTLY RELIABLE.

Used for all classes of Joinery and Builders' Work either inside or outside, Cabinet Making, Parquet Floors, Wooden Tanks and Receptacles, Upholstering, Built-up Mouldings and Cornices, Carriage Building, etc., etc.

LACTOCOL WAS APPROVED BY THE GOVERNMENT FOR CLASS I AIRCRAFT CONSTRUCTION.

Test it against the Glue you are now using. Lactocol has proved itself to be the best and most economical of all.
LACTOCOL is used extensively in Canada in the mass production of joinery work.

Manufactured solely by

LACTOCOL LTD., 2 STUDLEY ROAD, LONDON, S.W. 4.

UNION FOUNDRY AND MACHINE WORKS, Limited
(Successors to Allan's Foundry)
Office: 909 Duke Street
Saint John, West, N.B., Aug 2nd, 1921.

Holloway, Randell & Co., Ltd.,
Halifax, N.S.

Gentlemen,—

Your favor July 30th to hand. We received tin of glue and have found it to give the best satisfaction we have had yet.

We are now glueing up a large friction and will let you know later how everything turns out.

Yours very truly,
THE UNION FOUNDRY & MACHINE WORKS, Limited,
Per M. E.

Messrs. Holloway, Randell & Company, Limited,
Halifax, N.S.

Gentlemen,—

Replying to yours of August 1st, we beg to report that we have tested the Lactocol Glue and find it stands up to all tests very satisfactorily. It seems to us that this is the best thing in this line that we have yet had.

Yours very truly,
SAINT JOHN IRON WORKS, LIMITED
HPJ/VMF H. P. Jenkins, Manager.

D. G. KIRK WOODWORKING AND CONTRACTING CO.
ANTIGONISH, N.S., Aug. 3, 1921.

Holloway, Randell & Co., Ltd.,
Halifax, N.S.

Dear Sirs,—

Your favor of July 30th to hand, asking if we found Lactocol Cold Water Glue satisfactory. In reply, we may say that it is perfectly satisfactory. We soaked a glued piece of Douglas Fir for forty-eight hours and we were unable to take it apart.

Yours very truly,
D. G. KIRK WOODWORKING CO. RHD/MD

CHAPPELLS LIMITED
Wood Workers and Builders
SYDNEY, N.S., Aug. 1, 1921.

Messrs. Holloway, Randell & Co., Ltd.,
Halifax, N.S.

Dear Sirs,—

Replying to your communication of July 29th, would say that we have tested out Lactocol Cold Water Glue and up to the present are entirely satisfied with results in connection with its adhesive qualities. Another feature which Lactocol has is its price, which we find compares favorably with the ordinary glue on the market; the initial cost is a little more, but on account of its economic quality, we find it is cheaper in the long run.

Yours truly,
CHAPPELLS LIMITED
Per M. R. Chappell.

Pattern Work a Specialty
DARTMOUTH, N.S., June 20th, 1921.

Messrs. Holloway, Randell & Co.,
Halifax, N.S.

Gentlemen,—

We have given your Lactocol Cold Water Glue some very severe tests, namely, joining two pieces of teak, which, owing to its oily nature, makes it almost impossible to join satisfactorily with ordinary glue; also we joined a piece of hemlock to white birch, which withstood heavy hammer blows, and after being submerged in sea water for over 12 hours, still clung together as tight as ever.

We, after making these tests, highly recommend this glue for any kind of woodwork.

Yours very truly,
THE DOUGLASS FULLERTON CO., LTD.

Hardwood Products Par Excellent

Buyers requiring an exact standard of manufacture plus lumber cut from good timber will find it in our band-sawn White and Red Oak, Ash, Gum and other Arkansas hardwoods.

In addition to affording a reliable source of supply for these items, we also offer you the practical convenience of filling out special schedules with finely manufactured Oak Flooring, square edge parquetry strips, oak trim and moulding, which can be shipped in the same car.

Ours is a service of unusual scope and value, which it will pay you well to investigate.

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS ALL WALNUT."

AMERICAN WALNUT

"The Cabinet-wood Superlative."

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS ALL WALNUT."

"FOR DISTINGUISHED SERVICE."

Genuine American Walnut earned high honors for its enduring qualities when used for aeroplane propellers and gun stocks during the war.

Genuine American Walnut does not warp, shrink, split, twist or splinter. (See report in Bulletin, Ohio Experimental Station, March, 1921.)

These same excellent properties make it the preferred cabinet-wood of furniture manufacturers in the "piping times of peace." (*The public likes it.*—"That helps some.")

The genuine American Walnut furniture and paneling of today will retain its good form and be a credit to its makers for centuries to come.

Words of praise come to us from those who have received the Walnut Brochure de luxe, an illustrated informative history of this historic wood. You ought to be familiar with it. May we send you a free copy?

AMERICAN WALNUT MANUFACTURERS' ASSOCIATION

ROOM 1019 616 SOUTH MICHIGAN BOULEVARD CHICAGO, U. S. A.

Dimension Stock you can depend on

One of the largest and best equipped Dimension Plants in the South offers you its facilities. Situated in the heart of the Blue Ridge Hardwood district. Capacity 1,500,000 Feet per Month.

OUR MOTTO

REASONABLE PRICES—that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

BY MAKING TEST RUNS OF YOUR LUMBER

You will find that our stock will reduce your costs to a minimum and improve the quality of your product. Indiana hardwoods cost no more than the other kinds—then why not use them ?

We are the largest hardwood producers in Indiana and give below a partial list of stock on hand:

"What Others Say"

"Your letter of February 15th received and we want to say that this was a very nice lot of lumber. It was good widths and lengths and well manufactured, dry stock and the grading was very liberal. We are sorry we cannot use more of this lumber at the present time. ***We received several cars from other manufacturers at a cheaper price but the lumber was not nearly as satisfactory.*** When we are in need of more stock we will take the matter up with you."

(Note—The above was sent us February 24, 1921 unsolicited. Name given on application).

For Better Service

On January 10, 1887, there was organized by three young men, the Chapman and Dewey Lumber Company, with its office located in Kansas City, Mo.

On October 1, 1921, after thirty-four years of active business, the main offices of the company will be moved from Kansas City, Mo., to the Bank of Commerce Bldg. in Memphis, Tenn. This move has been ordered to increase our service to our customers. Inquiries will at all times receive the prompt and personal attention of one of the officers of the company. The Memphis office will be in touch, by long distance telephone with our yards and mills at Marked Tree, Arkansas. Our stock of 15,000,000 feet of Southern Hardwoods will be immediately available to fill your requirements.

We pledge you our word that the the thirty-four-year reputation of "Chapman & Dewey" lumber grades and quality will be maintained. We offer increased sales service at our new offices, and would welcome a personal call when you are in Memphis.

Is Business on Upgrade?

Is the much talked-of turning point from which business is expected to show a slow, sound, steady improvement a thing of the past? During the last few weeks furniture has been in stronger demand. Furniture manufacturers look for a busy fall. Building is on the increase and allied lines show signs of awakening.

Figures issued by MacLean Building Reports, Limited, covering August 1921, show an increase of over 100 per cent. over the total for July 1921. The figure as given is $36,307,200. This is by far the largest monthly aggregate since August 1914. This total is divided as follows:—residential $5 872,300., business $10,049,000., industrial $7,935,900. and engineering $12,450,000. The total for the first eight months of 1921 is $165,812 100. as against $192,470,200. for the same period last year.

An analysis of these figures shows that work was started on new factories and industrial plants to the value of $7,935,000. This is an increase of nearly 100 per cent. over the combined totals for the preceding seven months. That this is an indication of better times, cannot be disputed because industrial expansion in times like these is planned and carried out on a conservative basis. The manufacturers of Canada must have good reasons for embarking on this increased construction program.

Let us all put our shoulders to the wheel and do our part to bring about a resumption of business on a more substantial scale. After all, we as individuals are responsible for it is our attitude and our actions which mould and control general conditions.

Standardization Has Practical Value

Many favorable comments have been made on the suggestions contained in the article entitled "What About Standardization?" which was published on this page in the August "Canadian Woodworker and Furniture Manufacturer." The following remarks taken from a letter received from a large American woodwork manufacturer deserve more than passing attention for they represent on opinion based on the knowledge gained through sixteen years' experience in the production of standardized frames.

"We note with interest your remarks in regard to standardized window and door openings. This is a matter that is of importance to the entire mill-working industry. As you know, there are a large number of different opening sizes used throughout the United States and Canada and there is really no justification for the differences except tradition. The fact that these special opening sizes are used undoubtedly costs the builders of homes considerable money on account of the extra expense in making these special openings.

"We began manufacturing standardized window and door frames sixteen years ago and make all of our frames for the standard Western opening size which allows 4" in width and 6" in height for wood over the glass size on a 2 light window; and have either induced our customers to change to the Western openings or have kept out of the markets where special opening sizes are required.

"Without a doubt, if opening sizes were standardized there would be a tremendous saving to the consumer on windows and sash as manufacturers would be able to make a considerable reduction in the cost of manufacture if they were not required to make so many different sizes of stiles and rails."

Purchasing Power of Furniture Industry

According to figures recently issued by the Department of Statistics at Ottawa, covering the furniture industry in Canada for the year 1919, the value of the furniture produced was in round numbers $25,000,000., the exact figures given being $24,966,305. The value of the raw material used is given at $9,666,000. and is made up as follows:—Lumber $3,371,000.; veneer $340,000.; furniture frames $482 000.; furniture hardware $552,000.; fittings and finishing supplies $284,000.; glass and mirrors $601,000.; paints, oils, varnishes, stains, etc., $483,000.; iron and steel castings $198,000.; canes and reeds $87,000.; leather and imitations $313,000.; tapestry $642,000.; satins, velvets and velours $196,000.; tow, moss, hair, etc., $201,000.; other upholstering materials $351,000.; other furniture materials $816,000.; wire $77,000.; mattress ticking $86,000.; twine and buttons $34,000.; other mattress material $549,000.

Printers Still on Strike

The printers' strike is entering its sixteenth week. In spite of this handicap we are gradually bringing the "Canadian Woodworker" back to its pre-strike standard. We wish to thank you for the support you have given us.

Basic Rates in Furniture Work

Mr. Snaith Presents New Idea which May Revolutionize Time Study and Piece Rate Practice — One Practical Man Writes: " This Idea Advances the Woodworker About a Century, to Where He Belongs"

By WM. SNAITH, C. E., Associate Engineer with Forests Products Engineering Co., Chicago.

The setting of accurate rates for piece-work in furniture factories by means of time studies involves a number of considerations which rather sharply differentiate it from rate setting in other branches of industry. It need hardly be pointed out that accurate rates can only be established from the analysis of carefully made time studies. Records of past performance or the best judgment of individuals are sometimes used as a basis for rates but this is invariably unsatisfactory. In woodworking operations the cutting speeds are extremely high compared with metals of any kind. Hand feeds are the rule rather than the exception and in many other ways conditions are the reverse of those obtaining in the iron industry. All operations consist of handling and cutting and it is not at all uncommon to find the handling time amounting to 20 times the cutting time.

It is a great advantage to express all rates in terms of time instead of money, or, in other words, to establish standard times which can subsequently be expressed in dollars and cents if desired. The reason for this lies in the fact that rates of pay inevitably vary, but unless the conditions under which an operation is performed are changed the standard time established by time study will not change. This will be further emphasized in the discussion which is to follow.

Special Problems Presented

As a branch of the woodworking industry the furniture business presents a number of special problems of its own in rate setting. There are few manufactured articles which consist of so many component parts as the average piece of furniture, such as a buffet or dresser. Even a simple part will call for quite a few separate operations. Each operation has to be rated, so there will be quite a few rates for each article. Most furniture manufacturers find it advisable to make a varied line. This multiplies the number of rates to be calculated. Now the "life" of a design of any article will not average much over two or three years, except in the case of articles as standard as kitchen chairs and tables. Hence the "life" of the multitude of rates mentioned will be correspondingly short.

Imagine a plant working on the daywork system and changing to piece work. Standard times and piece rates would be set on all operations on all parts of every article. Some of those articles would be on their last run and these rates would die as soon as that run were completed. Others would die in a few months. In a year and a half 50 per cent. of all the rates would have similarly died of old age, and in three years the last of the rates so carefully figured out at the start would have passed into oblivion. Manifestly some method of replacing these rates with new ones must be devised. As new lines are designed new rates must be calculated. It is very evident that if time studies had to be made each time there would have to be an organization and staff to handle the work. This would involve delay and expense and is therefore impracticable. The new lines might be compared as to general similarity with some of the old ones and rates established on that basis. Later on newer rates might be based on these rates and so on. After a while these rates would be about as satisfactory as a straight guess. This method is equally impracticable.

Accurate Basis for Standard Times

The solution of the problem is to be found in basic rates. Every operation consists of a number of motions. Some of these depend on the dimensions of the piece and others on the class of work done on it. If time studies are made, so that the times of the component motions are accurately determined, it is a comparatively simple matter to analyse the times so observed and arrive at standard times for the various parts of the motions. These times may be re-combined for similar operations on parts of somewhat different design with absolute certainty that the standard time thus arrived a will be correct.

As an example of what is meant the operation of shaping may be taken by way of illustration. The handling time will depend on the kind of fixture or the absence of any, and the cutting time will be affected by the length of cut and the class of work. Size of piece may be a factor, and the kind of wood may exert some influence, although actual observation fails to indicate that this has a measurable effect. In the simplest case the operation will consist of three motions:

(a) Pick up piece,
(b) Cut,
(c) Put down on truck.

In a more complex case we might have:

(a) Pick up 2 pieces,
(b) Clamp in fixture A,
(c) Cut,
(d) Turn fixture around,
(e) Cut,
(f) Unclamp and put 2 pieces on truck.

Time studies reveal that the time to pick up one piece and place it on the table of the machine varies but slightly. It will take slightly longer to pick up 2 pieces, but this time will maintain a constant average. If the pieces vary considerably in size it is found that they can be divided into two or three classes, and the time for each class will be constant. The same will be true of the times for clamping into a fixture, once the times for the particular type of fixture has been determined.

Factors to Consider

It is found that the depth and width of cut and the class of work affect the speed of cutting. But for the same class of work the cutting speed is constant, and when the various classes are determined from analysis the time to perform the cutting operation is arrived at by multiplying the length of cut by the rate of feed for he rlass in question. One slight modification may be noted as applying to this particnlar operation, the expedient used is applicable to other operations also. It takes longer to shape sharp corners than straight

work. To take this into account time studies are made and show that each corner is equivalent to a certain number of lineal inches of straight cutting. This allowance is made before multiplying the length by the feed when one or more corners are to be cut. In actual practice the calculations involved can be made with great celerity.

By means of time studies all the operations are similarly analysed. It is found that in many operations some of the motions are the same and can be done in the same time. Thus the standard times become a check one on the other and the basic rates calculated from them consistent with one another. In other words, all operations call for an equal effort or expenditure of energy. There are no "easy" jobs and no "hard jobs," all call for only a fair average day's work of an average good operator. Better conditions produce better work and more of it.

Estimating is put on a more certain and scientific basis by calculations based on "basic rates." The exact effect of changes in design or methods can be determined before the changes are made and unless a saving is indicated the existing conditions can be maintained.

Provide Foundation for Piece-work

Of course the chief use of basic rates is as a foundation for a piece work system. They occupy the position of standards whereby performance may be measured. It is developed from the careful study of an operation, that it can be done ordinarily in one hour, due allowance being made for personal time, care of machinery, incentive, etc. If one man takes 1.2 hours to do the job his efficiency is 80%, while that of the man who does it in .80 hours is 120%. Without such a standard these relative efficiencies could not be accurately measured. If the pace of the fast operator were adopted as standard the average man could not obtain it and would be discouraged. If the pace of the slow man were adopted the fast man would "beat" the rate to such an extent that he would be overpaid and a loss would be entailed.

A word of caution may not be out of place concerning the limits inside of which basic rates will apply. In what has been said an important assumption has been made. This is that the product is made in comparatively small lots, the average size of which varies within comparatively narrow limits. When quantity production is the rule the basic rates will have to be re-determined for that condition. It is obvious that rates based on jobs lasting a few hours each can be very materially improved on when an operator can be kept continuously at the same work week after week or month after month. These later conditions do not apply generally to the furniture business and hence the use of "basic rates" is simplified and offers a solution to a problem which has the appearance of being so vast that few manufacturers have had the nerve to attempt its solution in a scientific way.

CAN'T AFFORD THAT NEW MACHINE?

One of the successful business men in America was recently asked by a youngish man, who had but recently started his own company, for some helpful pointers. After listening to an outline of the youngish man's affairs the veteran recommended that he do a certain thing.

"But I couldn't afford such an expenditure," objected the youngish man.

Then the veteran gave him this morsel of business wisdom:

"Don't count only the cost. Figure what it will bring in return. No outlay is costly that more than pays for itself."

Business men of foresight in all lines of industry make aggressive constructive policies backed by vigorous advertising pay handsomely where the timid fail and fall by the trade wayside.

Walnut cabinet in Spanish style.

Conditions in U. S. Furniture Market

A glance at the following figures, which are complied from a questionnaire sent out by the "American Furniture Manufacturer" give a fairly accurate outline of the conditions which exist in the American furniture field. The information given covers both the manufacturing and retail branches of the industry. While conditions on both sides of the border are not by any means identical or subject to the same governing influences yet as a general rule where business is good in one country it seems to be about the same in the other.

In Manufacturing Field

Told in percentages, the factory symposium is this:

Do you find orders increasing?
Yes—82%.
No—18%.

Is the trend toward better furniture, not necessarily higher priced, but from a quality standpoint?
Yes—94%.
No—6%.

Are the new designs or the old selling the best?
New—68%.
Old—32%.

Are you carrying stocks of merchandise to any extent, or making up orders as these come in?
Yes—61%.
No—39%.

Are orders you are now receiving for future or immediate delivery?
Immediate—92%.
Future—8%.

Are your material prices stiffening or softening?
Stiffening—54%.
Softening—46%.

In your opinion, will present prices stand throughout 1921?
Yes—80%.
No—20%.

What is your opinion of the proposed advertising campaign to the public; will it increase business?
Yes—93%.

In Retail Field

In your opinion, will the fall and winter months yield more sales than the first half of the year?
Yes—66%.
No—34%.

Are things picking up noticeably?
Yes—52%.
No—48%.

Are your sales for the last three months above or below those of a year ago?
Yes—24%.
No—76%.

What kinds of merchandise are moving the most rapidly?
Floor coverings, cheaper and medium lines in bedroom and dining room furniture, bed, springs and mattresses, also upholstered pieces.

Is the public demanding "better furniture" —that is a higher grade of merchandise (not necessarily higher-priced) than heretofore?
Yes—60%.
No—40%.

Are your local conditions favorable to increased business this fall?
Yes—50%.
No—50%.

Is building going on in your locality?
Yes—57%.
No—43%.

Are collections keeping up?
Yes—45%.
No.—55%.

What is your opinion of the proposed advertising campaign to the public; will it increase business?
Yes—78%.
No—22%.

Red Cedar as a Moth Destroyer

Some doubt is often expressed as to the value of Tennessee Aromatic Red Cedar as a moth preventative and destroyer. Many people seem to be of the opinion that the moth-destroying properties of this wood are over-rated. This is not the case; in fact judging from a report issued by the Department of Agriculture at Washington, D.C., the insect-destroying property of this wood is under-rated rather than over-estimated. A number of experiments were carried out in which live moths were introduced into cedar chests, together with suitable flannels on which they could feed. In practically every case it was found that in the course of a week or two all the moths died. Similar experiments were carried on with partially developed larvae, and while it was found that they were able to resist the destroying property of this wood for a longer period than the fully-matured moths, yet in the long run the effect was the same. While these experiments were being conducted, check experiments were carried on in which moths were introduced under similar conditions into ordinary wooden boxes. When the results of the different experiments were confirmed, it was found that while the moths in the red cedar chests died, those in the ordinary boxes were not only very much alive but had increased in number.

In most mills more oil is wasted than used. Half of this waste is caused through not scrapping old and broken oil cans. Such vessels will waste more oil in a week than would buy a new oil can.

Most folks do not think so, but there is an art in piling a stack of timber so it will be weather-tight, and dry without any undue warping.

Scientific Management in Millwork Industry

Operators of Woodworking Plants not Making Most of Opportunities — Efficient Organization Developes Business — Outline of Complete Organization for Millwork Factory

By ALBERT STEVES Jr., Steves Sash & Door Co., San Antonio, Texas.

We, in the sash and door business, must, in these piping days of peace and new found competition, be a sort of a mixture of lawyer, doctor, engineer, preacher, and good fellow, and if we lack any one of these attributes, we automatically place ourselves in the rear rank of present-day activities. I have come for the purpose of throwing the spot-light on such leaders in our industry, who have gone forward in a manner which deserves attention, and to assure you that it is a pleasure and an honor to do so.

One of the most interesting things in any business man's life, is to see the service which he can render. By service is not meant the old hackneyed, advertised, thread-bare phrase of "Quality and Service," but now it means the building up of an organization with your eyes to the front, never thinking of dollars and cents except as an incidental proposition. It is true that all business is primarily conducted for gain; a financial, substantial, mtaerial gain, but the world has come to look upon a business man as something more than a tradesman; has come to look upon the laborer as an artisan, and the three estates as recognized in the generation just ahead of us, do not stand as pre-eminent now as they did in the past; and in the next generation, the scientific business man, the man who has put his brains into his work and studied his problem, will not be in the class with the man who at one time was so in the minority as to power.

Still Learning and Progressing

The business man of to-day is at school. It is mostly a school he is building himself, and the business man of the next generation is going to a scientific school of business, just as the doctor, the lawyer, and the preacher, have done in the past, before he ever really enters the real arena of business itself. The idea of turning a young man loose with a big business (or any kind of business for that matter) in which he has had no schooling or training, has to be discarded, and, furthermore, is being discarded; so much so that practically every university in this country worthy of the name has to-day a department for schooling men in business methods. Those of our fathers who were fortunate enough to have gone through high school, and even those who finally got to college, always topped their course with a three to five months' business-college course, which taught them the rudiments of bookkeeping, and that was all. To-day bookkeeping is taught in the grade schools, but the theory of business, of finance, of labor, of statistical information, of trade barometers, and the like, are all being studied by all worth-while business men, generally, during office hours.

Then there is the tremendous field of advertising. The average business man of yesterday will tell any advertising agent who comes into his office that he (said business man) knows more about the sash and door game than the advertising agent, who may only know that a door is made to pass through, and a window is made to let air and light in. The agent, very naturally, knows little, or perhaps nothing, of millwork—his field is not production—it is attracting attention to the finished product. Said advertising man has been taught, however, the fundamentals of business and it is on these fundamentals alone that he works.

Thorough Grasp of Fundamentals

All men in the sash and door game must begin, even at this late a day, with fundamentals. Unfortunately, too many of them have never considered fundamentals, and do not to-day. To them a day's work has to be gotten through with, so you might worry along with it and get it over with. However, the scientific manager does not feel that way about his business; he is glad when the sun comes over from the East, and sorry when it is time to go home. His office, in the first place, is not the usual dump, or hole in the wall, but it is a well ordered, well lighted, well ventilated place in which to work, and is in proportion and commensurate to the amount of work that his office must do in relation to the production end of the business. Fine books, and large adding machines, and beautiful desks, and lots of telephones, filing cases, and the like, do not make a scientific business. Any institution in which only brains have been put, and the heart has not been allowed to show itself, is not a scientifically managed business. You will please understand that I am preaching that a man's business must be a pleasure, and his pleasure must not alone be guided by his mind. In hiring his people, he must consider various qualifications, but the personal element must enter into every human machine that is employed. In other words, there must be a point of contact, and if this point of contact is overlooked, the wrong employment must not be given nor taken. I mean there must be complete understanding which does not necessarily come through intimacy.

My idea of co-ordination in a medium sized sash and door business is something like the following diagram:

Qualifications of a Manager

I presuppose, of course, that it is a chartered concern with a duly elected board of directors by the stockholders, and let me say in passing, that I always consider it a good idea to have some of the employees, or at least department heads, as stockholders. The manager of the institution need not necessarily be a member of the board of directors, but he certainly should be a stockholder. I shall set forth from time to time throughout this paper my ideas about qualifications of the manager without setting forth any sequence here; suffice it to say that all of the dependability and trust possible must be imposed in this most important position in the business, and all co-operation for successful administration should be given by both the stockholders, directors and department heads.

The temper of a manager is one of the biggest assets or liabilities that any concern can have. It might be all right for some supernumerary to lose his head once

in a while, even though that is not desirable, but the director of any organization must stay on an even keel. It doesn't mean that he must never get angry, but that he must never show it in any way. Also, one of the greatest mistakes would be to get angry, and then over-ride department heads. It doesn't necessarily mean that he is losing his prestige, or his power or his authority by getting after some sweeper in the mill, or some stacker in the yard, or some poor girl in the office. It doesn't mean that; but every time that he over-rides his authority or loses his head his business is hurt just that much, and in proportion to the loss

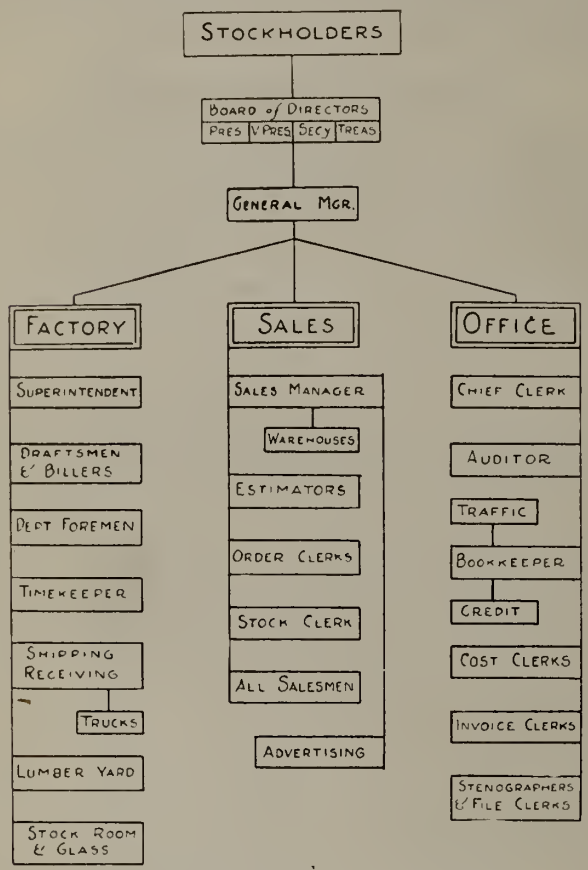

Chart showing distribution of responsibility

of his head. Also, there are some men who think when they start work in the morning that everything should be a bed of roses from the time that they arrive until they leave, and that the land of milk and honey is their business. The worth-while man looks for trouble; that is, he looks for a job, and just because things do not run smoothly he does not get angry, because he does not expect them to run smoothly—the first-class man does not expect things to always run smoothly; it is only the pee-wee who gets angry because things do not run on a greased sliding board, and unfortunately, there are a terrible lot of pee-wees.

A manager of any institution who gets in a "humdrum" fashion, or who does not attend to anything but his office, should be excused from his position by his board of directors as soon as convenient. Just about half the work that a manager does should be at his office or for his company directly. Any manager who does not take an interest in civic affairs—and the war certainly taught us how to handle civic affairs—should not be retained in the position he holds, or better, he should be asked before the position is given to him whether his qualifications are such that he is equipped to work in a general field shoulder to shoulder with men of every business. The Chamber of Commerce, the Rotary and Kiwanis Clubs, or any number of like organizations, offer fertile fields in which a man can show his ability. I have seen supposed executives who "cannot get away," or executives who attend to everything and do nothing worth while. There are, of course, businesses that have succeeded in piling up huge bank balances by methods of this sort, but the business and the executive merely tried to "get by," and the deplorable fact is that they think that they did.

Co-ordination of Departmental Activities

The purchasing department should be under direct supervision of the manager. Any business with co-ordinate heads should have the responsibility of the purchasing of various items, even merchandise, placed in the hands of the department heads. However, in this particular instance, above all others, the manager should exercise the closest scrutiny.

It is much to be desired that the closest of contact be maintained between the heads of departments, and certainly between whatever co-ordinative branches are set forth. The friendliest feeling must exist not only among the department heads, but among all the different men and women who go to make up one big family in any one organization. The spirit of friendly rivalry is, of course, greatly to be desired and looked for. Instituting dining rooms and service clubs and whatever you choose to call organizations that really meet out of business hours, either for safety, or for insurance, or for any other activity that is of vital importance to the employees—these always come back to the company with interest compounded. Particularly has all this been proven during the last two years when there has been such a spirit of unrest, even among the most satisfied of workers.

In the factory the most important item, of course, is the cost system. The superintendent should have under his immediate jurisdiction not less than four or five department heads, two or three draftsmen and a timekeeper. The factory heads or foremen should be responsible for their men and this makes a complete sequence, with the exception of the shipping department. The shipping department, of course, has delivery wagons and trucks, as well as the receiving department and local shipments, directly under their jurisdiction, and this work must be properly co-ordinated between the chief clerk and superintendent. Such management is extremely simple when properly worked out, but it is not as simple as it seems on paper. The only simplicity of it is that there must be only one rule over which there must be no deviation whatsoever. The matter of industrial remuneration is the one that has received the greatest amount of care and attention since the war. The superintendent should be given authority to handle this remuneration after a clear-cut policy is defined to him. The policy of the open shop or the American policy of equal rights to all and special privileges to none, should, in all cases, be impressed upon all superintendents.

Ninety-eight per cent. of all the trouble between employer and employee in industry is superinduced by the pestiferous, non-productive outsider who is sedulously busy telling those on the inside just how they can get more by doing less. These self-appointed guardians of the so-called oppressed, assume that the wage-earning masses are fools, and need experts to tell them how to deal with their employers. What red-blooded person can blame Judge Gary for refusing to

deal with a piece of communistic mistletoe like Foster, and others of his stripe, who thrives only upon the sweat of other brows? Detroit, whose record of remarkable growth, as revealed by the census, surprised the nation, was designated at the Montreal convention of the American Federation of Labor as "The Open Shop City." Whether the city's increase of one hundred per cent. in population in ten years, with 1,000,000 people and many great industrial establishments to its credit, can be attributed entirely to its freedom from domination by trade unions, the fact remains that in the most open of all open shop cities in the United States the persuasive arguments of the unions have failed, their theories have proven false—wages paid in "the open shop city," the city to which the American Federation of Labor would extend its influence, drew thousands of trade union men from closed shop towns. And these men were glad that the industrial "jugernaut" did not tramp them down; they were happy that the open shop was not closed to them.

The Moss Plan of industrial remuneration is one of the very best that I have seen applied to the sash and door industry. Mr. Moss, as you know, is the President of the American Sash and Door Company of Kansas City, and is one of the most able thinkers of our industry. His plan is to pay a preferred dividend to the stockholders from six to ten per cent.; and after that is paid, to consider the employees from the president to the sweepers as stockholders, using as a basis the annual wage of each employee. Group insurance is also a very splendid thought for the employees. This is given to them after a certain period of service, and is merely a life insurance policy of from five hundred to two thousand dollars, the premium which company pays. This is a form of additional pay, which is very much in use, and has worked out some very splendid results.

Intimate Knowledge of Costs

The chief clerk, or office manager, has under his control the bookkeepers, of whom there should be at least two; also, invoice clerks for the proper figuring of all charges, as here is the greatest leakage. The cost system should be attended to by the office for the benefit of the factory. Not that the chief clerk has any supervision or authority over the superintendent, except that when the authority is divided in this way, a sort of rivalry springs up, which is conducive to the best of results. The stenographers, invoice, and stock clerks, should all be under the chief clerk. When it comes to the cost system, many of you remember the dark hours of the war when the millwork industry appeared before the War Industries Board and was asked what it could do for the country, and the millwork industry had to stand open-mouthed before these men and tell them they did not know. When the same War Industries Board asked for costs, they could not be shown or given. That was deplorable. During the war, fortunately, the word "competition" was left out of the vocabulary of most businesses. Unfortunately, since the armistice the idea of keeping up the morale of your competitor has again subsided. A first-class manager must, above all else, know his competition and handle it on a scientific basis. He must work out a volume of business in his territory, or at least he must estimate it, and then not try to be a hog with it. In other words, he must in word, deed, and fact, mould and keep up his competitor's spirit. That is one of the biggest jobs of a manager.

Annual audits are, of course, in this age of taxation very much employed. There was a time when a bookkeeper very much objected to an audit. In this day and time, if a bookkeeper should object to an audit he should be immediately discharged, just the same as any employee, who is put under bond and objects, should be discharged. Every employee who has any position of trust should always be put under bond; the company, of course, paying the premium.

Sales and Advertising

The sales department should have, above all else, efficient estimators. A concern that does about a million dollars worth of custom-made work during the year will estimate between six or seven million dollars worth of work, and there should be one estimator for every two million dollars' worth of work to be estimated. This has been scientifically arrived at. Then there should be, of course, a competitive sales force. This, naturally, depends upon the territory in which the plant is situated, and ordinarily, the average salesman in the sash and door business should produce between twenty and thirty thousand dollars' worth of direct sales, and account for an equal amount in indirect sales per month. So it is easy to arrive at a figure here as to the amount of business that a concern feels that it can do or wants to do. The jobbing warehouse should be directly under the control of the sales department.

One of the most important duties of the sales department is, of course, the advertising. Now advertising should be intensively done, if done at all. Newspaper advertising in the sash and door business is waste of money. It is only the direct advertising that pays, and, by direct advertising, I mean advertising to contractors, lumber yards and prospective owners, who have indicated a desire to purchase something in the building line. Low prices have never made a sale of building material. A "desire" for them has made sales, and it is only by advertising that a desire can be created. When such a desire is created, then the sales department, in its advertising way, is accomplishing a purpose and that is what you want to arrive at, of course—a purpose. Handsome catalogues, pamphlets and booklets, together with an occasional trinket of some kind, is money intensively invested in the sash and door business. There are, of course, a great many ramifications to this subject. The minutia of detail is tremendous, but the results are also tremendous, if scientifically arrived at. Reports from department heads are absolutely essential; reports that can be made into graphs; reports that can be used for comparison—they are not only desirable, but they are really a pleasure, and any business that is not a pleasure is not worthy of the name.

One of the policies of a first-class company should be to align themselves with trade organizations, or other crafts. Every millwork industry should belong to a national, sectional and local organization. It should subscribe liberally to trade magazines; to business magazines. There are some splendid services to be subscribed for at practically no financial cost, which service, such as the Dartnell Service, is of tremendous value to sales and office forces. Forbes Magazine strikes more at the root of business than any that has come to my attention. It is passing strange that in practically no magazines is there ever an article on the millwork industry. When systems are asked for from any service that business writers or magazines solocit,

the millwork industry seems to be beyond the pale. There must be an answer for that, and it seems that the answer is that real systems have seldom been tried in the millwork industry. In the course of the next few years, however, great strides will have been made in the right direction. Most magazines now carry millwork advertising, and there is only one up-to-date national advertised lumber concern.

It is therefore with fitting interest that I call upon you to go to work. Go to work is a scientific way; study your problems in a dollars and cents way, if you please, but before all else, remember that there is a better way to do everything, and if you run your business in a co-operative and co-ordinative spirit, together with the gentility and suavity to do as you have naturally fallen heir to—the pendulum will swing back the other way and we will again come into our own.

Foreman Relation to Modern Industry

Should Strive to Retain Good Will and Respect of all Employees — Taking an Interest in Their Welfare and Home Life Creates Feeling of Friendliness and Confidence — Has Difficult but Extremely Important Position to Fill

By R. J. WALDO

(Continued from August issue)

After a most careful and exhaustive study of foremen, including the most successful in the field, I have made the following notes as to what makes a successful foreman. It is quite improbable that each and all will be found in every foreman, however, they are the fundamental elements which make for a successful department head.

No foreman will succeed for his employer who does not treat his men as he wants them to treat him. This practice of the golden rule is, I consider, most important of all. It is the one drawstring which enables the department head to get maximum production from his men and hold for his employer the practical, desirable men.

Favoritism Must Be Taboo

No foreman can succeed who plays favorites with his men. If there is anything a worker detests more than a favorite among his fellow-workers it is a foreman who plays favorites. The desirable employee and the employee who proves the most efficient is the one who wants to be recognized by his ability and not be favored because the foreman takes a liking to him or a dislike for others. There are times when a foreman is admired by workers because he shows a favor to some workmen, however, these times are when some employee is sick and unable to work. If the worker has a family dependent upon him this sort of a favor is appreciated by the fellow-workers of the employee who is in such unfortunate straits. By showing this sort of respect the foreman wins the good-will of his men and in turn his employer.

In shops where team-work is found the foreman must be a man demanding a fair deal among the workers as well as the fair deal toward the company. He must be man enough to speak up to his superiors when they issue an order which will render hardship upon his workers. Many a foreman has lost the respect of his workers because he would not speak against an order which he knew full well would work a hardship upon those under him. He should be able to distinguish between the company's rights as an employer as well as the workers' rights as a wage earner and be willing and ever ready to make suggestions which will rectify any mistakes which may be made by his superiors.

The foreman who is always criticizing the bad work his men do without a word about the good work done is in the wrong. No man desires to hear criticism continually about the work he has spoiled when he spoils very little and that possible because of some fault of the machine. The foreman who criticizes his men for poor workmanship when the machine is at fault will never gain the full co-operation of his men. This has been proved. Foremen must be able to distinguish when the machine is at fault and when the man is at fault. During the war I knew personally one foreman who tried to know every time an especially good lot passed through and was very prompt in recognizing the good work to the man who did it. He never had the record of scrap in his department that was found in some of the other departments of the same organization.

When passing through a plant one afternoon I happened to stop by the inspection table. The inspector had called the foreman and told him that there were three pieces that were not filed down as much as they should have been. The foreman did not return the pieces to the worker, but took a file and corrected them himself, saying that the man that had filed them down at first was busy on another lot and he could do them quicker than they could be returned to the man. After the foreman returned he said nothing to the man about it for several days, when he mentioned it to him casually and in no manner of criticism. He realized that an occasional mistake was being made by the men and during the rush which was being experienced he was prepared for them. Such foremen do not have such a high labor turnover and have always a waiting list from the plant of men who want to wor kin the department.

Interested in Advancement of Employee

Later when in the tool designing department I found that a special tool was being designed for one of the machines. This I understood to mean that the machine which had been idle for some time was to be put back into use again. The next time I saw the foreman I asked him if he wanted a new man for the machine He promptly informed me that he was going to put Young on it. He felt that he should do so, as it would mean more money for Young and he had proved so efficient upon the bench that he said he would rather do it. Young was put on the machine and curiously enough the foreman stayed wit hhim for two days to be certain that he understood thoroughly the machine before he left him. During the entire time that Young was being trained no rejected pieces was allowed to

be returned to him by the inspection department. This foreman made the part right and in a very pleasing and satisfactory manner corrected the mistake with the operator without him ever knowing that a mistake had been the cause of the foreman stopping to point out the error.

The foreman in event of a grievance should always be willing to hear the entire story from both employees before making any decision in the case. In former times a foreman heard the first story and decided that his favorite workman was right. However, those days have passed and now in place of them we find the foreman who is willing to hear both sides before making any decision.

I was standing upon a street corner one afternoon when two other men were standing near. They were talking about a sick child of the older man. Soon another man came along and promptly asked, "How is the kiddie, Jack?" The older man promptly responded, "Getting along first rate, Buck." The latter man then added, "Gladto hear it," then went on. It was a simply worded inquiry. Yet I understood from the conversation between the two men that it was his foreman. This sort of a foreman, who is interested enough in his workers affairs to make inquiry when out of work, is the man who is admired by his men.

Must Have Broad Outlook

I have been informed by a superintendent that he has a foreman who takes particular pains to keep close check upon what his workers are doing while away from the plant. In one instance the foreman stepped into the superintendent's office and asked for a raise for one of his men. The superintendent asked upon what grounds the man was asking for the raise, and was promptly informed that the man had not asked for it, but he knew he was starting to buy his home and knew that the raise would come in handy and in turn make him thoroughly appreciative of the raise. The raise was promptly granted.

Another foreman knows personally the district representative for one of the largest correspondence schools, nad whenever a man from his department makes an inquiry he always keeps posted as to whether or not the worker took the course or not, and if not, why not. When he sees a man taking a coarse he watches, and as soon as he sees an improvement he always puts in a raise before being asked. He also keeps a close check upon the worker to be certain that he does not drop it because of financial difficulties.

Again let mes ay that the foreman who makes a mistake in giving an order should be willing to shoulder the blame every time. I have seen foremen argue that they gave the order right and that the man was wrong. This draws contempt of his workers more than anything that I know of. It in timed estroys the moral of the department.

The foreman's job is beginning to be one of the important jobs of industry, and unless the men holding these places are willing to shoulder their part and be willing to do the things that will make for greater reospnsibility and efficiency of their department, then they beter step down and let some one take the place who will. Industry to-day is demanding broad-minded men for these places, and as soon as men are demanded they usually appear. However, if men wish to hold their places they must keep abreast with the times and advance as fast as the industrial world or they will awaken some day to find another man in their place.

Is Cooperage Industry on Retrograde?

In an effort to arouse the interest of its members and to increase the active membership of the organization of the nation the Association of Cooperage Manufacturers recently addressed a letter to present and prospective members from which the following startling queries and statements were taken. If the situation is anything like as serious as pictured it behooves every person interested in this important industry to assume the aggressive, and not only strive to regain lost ground, bnt to win new fields and new markets for barrels and cooperage stock. Regardless of how satisfactory or how serious the present situation may be or how little the industry is effected by the competition of rival containers, it is always a good, sound business policy to be constantly on the alert and ever on the aggressive:

Is the scythe of business Death starting its swing in the cooperage industry? Why?

Is it accident that the flour business is practically lost to cooperage?

Is it just "chance" that the sugar business is swinging to other packages?

Is it merely "general business conditions" that has crowded cooperage out of the cement field?

Whose fault is it that cooperage to-day has its back to the wall in the fruit trade?

What condition made possible the increasing use of steel barrels and drums?

While all this slipping and sliding has been going on has anyone in the cooperage business tried to check it?

Why is cooperage to-day a shrinking, dwindling industry—when ever flour men, cement men, sugar men and fruit men freely admit the splendid service value of the barrel?

The true answer to most of these questions may be summed up in the statement that, while many producers of cooperage are not even fairly keen on the manufacturing end, they have not as a class progressed much beyond the kindergarten stage when it comes to marketing that product.

This goes far beyond any question of price.

It means an understanding of the uses to which their product will be put; the service which such uses demand; the problems involved in the best handling of various products to their final users; the need for and adaptability to special purposes. Nothing, short of this, will save cooperage—or any other industry.

The record shows, however, that manufacturers have persistently and almost wilfully disregarded these vital elements.

Too many have been busy turning out rotten stock—afraid to face honest inspection—trying to skin out a little passing profit on an unknown basis of cost and an undreamed of basis of market needs.

All civilized countries require every man who would practice law or medicine to pass rigid examinations after long and arduous study before he is permitted to practice his profession.

Maybe sometime, reputable business will be protected from the suicidal tactics of the man who, because he can borrow some capital, embarks heedlessly upon some line of business that "looks good."

With persistent blindness to facts, in the face of earnest and continued efforts to bring about better conditions, the industry as a whole has ignored the growing evidences of a decline.

In the fact of strong, intelligent and persistent com-

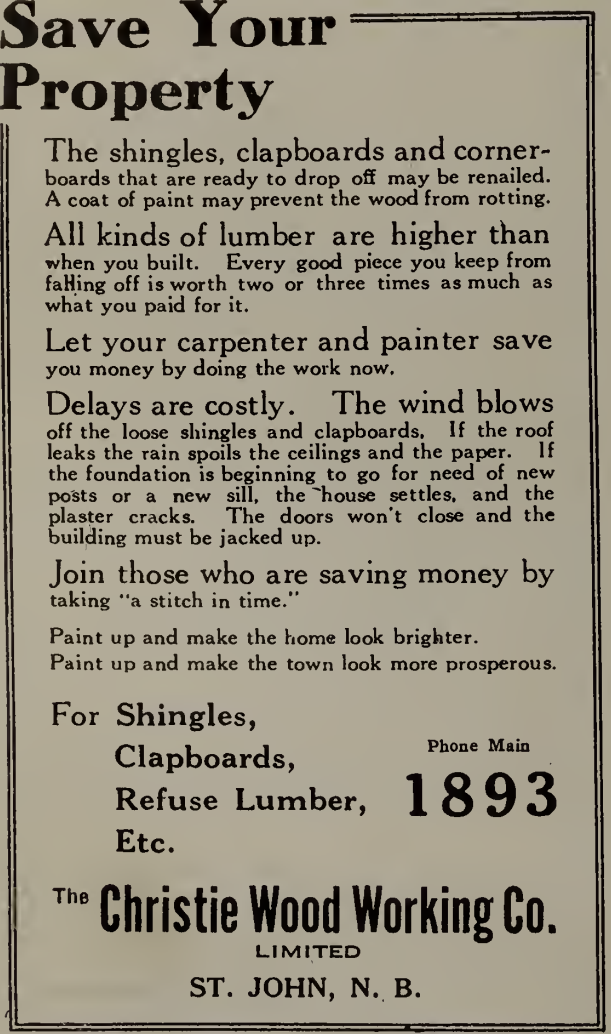
petition, it has held an attitude of indifference—and now comes the reckoning.

And to-day we find the cooperage industry headed straight for the rocks—and no amount of procrastination, refusal to face facts nor old-time tactics can save it. And it is almost too much to hope that the policies which have brought it there can be changed over night.

The "squeeze" is on. The competition of other containers of quality, adaptability to user's needs and backed by strong salesmanship is exerting its relentless pressure.

Co-operative Advertising

A number of progressive concerns in St. John, N.B., have been doing considerable co-operative advertising. Included among these firms are paint and hardware merchants and a number of woodworkers. The idea is that what benefits one usually means a little business for the other. Thus if people can be persuaded to repair their buildings, it means a sale of paint, while on the other hand if they can be persuaded to paint up, it often means a sale of lumber or building material for repair purposes. In this way the woodworking plants and merchants both stand to secure a share of all business accruing.



Type of Envelope Stuffer Used

Early in the season a newspaper advertising campaign was conducted along the line of Repair Up and Paint Up, and it is the opinion of those concerned that the large number of houses in St. John which have been repaired and painted this year, is due in no small degree to the publicity carried on.

At the present time they have prepared a large number of circulars for use as envelope stuffers, as shown in the accompanying illustration. While the expense of these stuffers is shared by those entering into the scheme, yet the advertising each firm sends out bears its own name. This is a very inexpensive form of advertising yet it is very efficient and in this particular instance is showing results.

The idea of co-operative advertising is a good one and could well be adopted by similar concerns in other cities. It is commonly believed that the revival of business rests largely with the building industry. Advertising of this kind offers one way of stimulating building and helping along the much heralded trade revival.

Among those taking part in this campaign are:—The Christie Woodworking Co., Limited, and Haley Bros. & Co., both of St. John, N.B.

The Distribution of Wealth

It would greatly simplify the industrial and social problem if everybody would grasp the fact that the great function and purpose of all legitimate business is to supply the needs and wants of the population, and that the aims of business should be to increase constantly the supply. The effort should be to meet the constantly expanding wants of the people. There is no limit to them. There is no danger of overproduction, so long as production is kept in balance, so that everybody has something to offe rin the exchange that is in demand. Every class and group in the population is interested in increasing production, so that the standard of living may be constantly raised.

When this general function of business is understood, and all classes concentrate upon it, the test of every policy will be the effect it has on production. It will soon be discovered then that there is no other employment for capital except in production for the public market and in distribution thereupon, and, therefore, that accumulations of capital are beneficial to the entire community, no matter who owns them.

A Convenient Humidity Table for the Wet and Dry Bulb Hygrometer

Users of wet and dry bulb hygrometers will find the following table, compiled at the Forest Products Laboratory, Madison, Wisconsin, very useful for quickly determining relative humidity values from wet and dry bulb thermometer readings. To use the table, read the temperatures and subtract the met bulb reading from the dry. Locate the vertical column of figures headed by the appropriate difference between wet and dry bulb readings, and the horizontal row of figures beginning at the extreme left with the observed dry bulb reading. The figure marking the intersection of these rows is the relative humidity value expressed in per cent.

Take the following as an example: Wet bulb temperature 13 2degrees Fahrenheit; dry bulb temperature 140 degrees; difference 8 degrees. The figure marking the intersection of the vertical column for 8 degrees difference with the horizontal row beginning with 140 at the extreme left is 79, which is the correct relative humidity for the given thermometer readings.

Relative Humidity Table

Difference between wet and dry bulb thermometers in degrees Fahrenheit.

Temperature of Dry Bulb.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40

Find difference between wet and dry bulb readings, then follow the row which corresponds to dry reading to column headed by difference in temperatures and the figure at the intersection will be relative humidity, expressed in per cent.

Interesting views taken at plant of Radford-Wright-Wilson Co., Limited, Winnipeg, Manitoba

General view of factory and warehouse Radford-Right-Wilson Co., Limited, Winnipeg, Man.

Modern Woodworking Industry in Manitoba

Has Built Up Large Business in Last Few Years — Plant and Equipment Modern in Every Respect — Giving More Attention to High Class Work

By E. H. CHAPMAN, Winnipeg, Man.

That all the progressive, up-to-date woodworking plants are not confined to Eastern Canada or the Pacific Coast section may be gathered from the accompanying views of the industry of Radford-Wright-Wilson Co., Limited, Winnipeg, Man. This firm started in a small way a few years ago, but has grown and expanded until to-day it is numbered among the largest woodworking concerns in the prairie provinces, if not in the whole of Canada. A glance at the illustration, showing a general view of the factory, storage buildings and yards, will give an idea of the size and completeness of the present unit. The addition shown on the left has been but recently been completed.

This business was founded in 1910 by W. F. Radford, who equipped a small sash and door factory. A disastrous fire, in which the plant was burned to the ground, occurred shortly after it was put in operation The fire proved to be of incendiary origin, having been set by a fire bug who was responsible for about twenty-five fires. The plan of this monomaniac was to start a fire, turn in an alarm and then assist the firemen in their efforts to extinguish the blaze. He was eventually captured and judged insane.

Have Developed an Efficient Plant

In spite of this set-back, the firm never faltered, but immediately commenced the construction of a new and larger plant on the site on which the present industry stands. This has been expanded and extended many times since 1910, but the efficiency of the factory and the comfort and convenience of the workmen has never been lost sight of. The pictures taken in and around the plant show a modern, well-lighted structure, with fire-breaks, fire-walls and an automatic sprinkler system to lessen the fire risk. The machinery is not crowded, as there is plenty of floor space allotted to each piece of equipment, tending for maximum production, also for the comfort and safety of the mechanics. A shavings exhaust system takes care of the lighter refuse, further adding to the comfort of the employees.

The first illustration shows a scene in the planing mill. This battery of stickers is kept steadily at work on mouldings, sheathing, special detail work, etc. Overhead among the exhaust system pipes can be seen a horizontal steam radiator. This ensures a more even distribution of the heat than if wall pipes or radiators had been used exclusively.

The second view shows a section of the cabinet-making department. An immense variety of work is handled here, including the regular line of millwork and special high-class woodwork jobs of all kinds. Here again it will be noticed that there is an abundance of light. A glimpse of the glue room may be had through the open doors.

Work Kept in Orderly Manner

The third picture depicts the operation of panel-raising. It also shows how the work in progress is stacked in neat, orderly piles. This is a noticeable feature of the whole plant and suggests efficient and careful supervision.

The fourth view was taken in the door department. The machine in question is a double end tenoner with chain feed, and as a rule is found only in plants where high production is sought. The fire-breaks mentioned previously can be noticed in this illustration. These are dropped down from the ceiling and extend the full width of the building. In the event of fire, they tend to retard the rapid spread of the blaze by preventing the blaze from running along under the roof.

The fifth photograph shows the dry kilns and some of the raw material. It will be noticed that the lumber is piled on kiln trucks so that it may be placed in the kiln without rehandling.

The last picture, No. 6, was taken in the sash department, and shows a fast feed sash sticker. In several of these views it will be noticed that the main shavings exhaust pipes are under the floor and that the auxiliary feeds are carried over and down.

When working to capacity the output consists of three hundred doors and six hundred windows each day, in addition to an immense quantity of frames and

general woodwork. While the plant was designed primarily for the production of sash, doors and millwork, in recent years they have gone after the very best jobs and have turned out special orders that compare favorably with anything produced on the continent.

About one hundred men are employed in the factory, and, as suggested before, nothing is left undone that would add to their comfort or convenience or that would tend to make them better satisfied with factory conditions. Lockers and other facilities have been provided, and to add to the cheerfulness of the plant, the walls are kept white and clean.

The electric drive is used throughout the plant, power being secured from the city of Winnipeg. The steam plant is used to provide heat for the kiln and factory.

The personnel of the company is as follows: W. T. Wright, president; Donald H. Radford, vice-president; James A. Wilson, secretary-treasurer and general manager, and C. W. Radford and F. W. Radford, directors The Radford family are pioneers in the woodworking field, as the last three generations have been engaged in this line. Under the able management of the above officials and directors, this industry has become a big factor in the woodworking field in Western Canada.

Interesting Machinery Displays at C. N. E.

Several New Machines Included in Exhibits — More Room and better Facilities Required —Machinery Hall Proved Centre of Interest

Whiel the quality of the displays at the Canadian National Exhibition was maintained at the usual high level, the number of machinery manufacturers and dealers making exhibits showed a marked decline. This was due to the fact that the building and facilities provided for displaying machinery and equipments are entirely inadequate. One can picture the interest aroused by a display of woodworking machines set up and in operation. Judging from the questions asked, the general public is in need of some education in this respect. As an example, one visitor happened to see a piece of moulding lying on the bed of a nailing machine, and asked if that was the machine in which such moulding was made. If proper space and facilities were available, the manufacturers of woodworking equipment would be only too glad to set up their newest and best creations and put them through their paces.

Displays of woodworking equipment serve a double purpose, in fact they serve many purposes. They enable the manufacturer to exhibit and explain his line and they provide an opportunity for the woodworker to keep fully informed as to all the new developments in the line of machinery and accessories. It is interesting to watch a practical woodworker approach a booth and see his eye brighten when he sees something new in his line. It does not take him long to size up the machine, note its weak and strong features and also make a mental note of where it could be used to advantage in his own plant.

Anyone interested in practical mechanics would have been amply repaid for a visit to "Machinery Hall." Among the exhibits of particular interest to woodworkers were the following:—

P. B. Yates Machine Co., Limited. The display of the P. B. Yates Machinery Co. was made in their usual location and consisted of a number of their woodworking machines. Probably the feature of the exhibit was the new No. 830 nailing machine. This machine was set up and in operation and was always a centre of attraction. In addition to the nailer, a G 2, straight edging and jointing saw, a No. 156, ball bearing single surfacer and a S 2, edge sander comprised the heavy machines, while a "Black Diamond" combination circular and band saw filer and setter and a "Black Diamond" band saw filer completed the machinery display. The G 2 straight edging and jointing saw was fitted with ball bearings. This is a new departure in the construction of this machine. Another feature was a flexible coupling between the drive pulley and the saw mandrel. This coupling serves two purposes. One is that it takes up all belt vibration which would otherwise be transmitted to the saw, and in addition it provides an easy means of attaching a motor if a direct-connected electric drive is preferred.

A. R. Williams Machinery Co., Limited. This firm made their usual comprehensive display of wood and iron-working equipment. The woodworking end of the exhibit was taken care of by three C.M.C. saws. Two of these are new machines, one the No. 613, light ripping and jointing saw, being a lighter edition of the well-known 611 straight edging and jointing saw, and the other No. 605 improved self-feed rip saw. embodies many new and improved features, some of which are being covered by patents. The third machine was a No. 617 variety saw. Included among the iron-working equipment was a number of engine lathes, together with milling machines, shapers, grinders and the equipment of a similar nature. A number of small tools and accessories, including some precision equipment, completed the exhibit.

Garlock-Walker Machinery Co., Limited. Instead of taking place in the Machinery Hall, as has been their custom in the past the Garlock-Walker Machinery Co., Limited, of Toronto, made their display in their machinery warehouse on Dufferin St. As this warehouse is situated just outside the main entrance to the grounds, they thought that they were in a favorable position to receive their many friends, as well as to attract new ones. Not only that but by making a display in this manner they weer in a position to show their entire stock of new and used woodworking and iron-working machines. Just inside the entrance to their warehouse they were showing a number of "American woodworking machines, including a No. 30, universal rip and cut-off saw, American No. 25 straight edging and jointing saw, American No. 3, double cut-off saw, with power adjustment, and an American power feed jointer and a disc and spindle sander. In addition almost any machine one would wish to see was on the floor.

Elliott Machinery Co., Limited. As usual the display of the Elliott Machinery Co., Belleville, Ont., was a centre of attraction. Their combination woodworking machine, together with the supplementary equipment, such as small pony planer, jig saw, drum sander and band saw attracted widespread attention. The construction of the Elliott combination woodworker is

such that two men may operate different parts of the machine at the same time. It is designed for such operations as ripping, cross-cutting, mitering, gaining, dadoing, jointing, bording and many other operations in an efficient manner. The construction is such that it can be driven either by electric or gasoline power. The interest in this display was increased by the fact that most of the machines were in operation. It if were possible for the manufacturers of woodworking equipment to set up and operate a representative display of their line, it would make an educational feature that would tend to arouse greater interest in woodworking equipment and wood products.

Cowan & Co. of Galt, Limited. This firm was not able to secure their usual space, but at the last moment a half section was offered them. As this space was limited, they found it impractical to make a very imposing display. They were showing their No. 319 belt sander, Cowan hollow chisel mortiser and a Cowan jig saw. Supplies, in the shape of moulder knives, saws, cutter heads, mortise chains and the Cowan round safety cylinder head, were also displayed. A representative of the Concord Piano & Player Piano Co., Melbourne, Australia, evinced considerable interest in the Cowan line, and before leaving he placed a good order for equipment for the new factory his firm are erecting at Melbourne.

Chapman Double Ball Bearing Co., Limited. A convincing demonstration of the low friction co-efficient of ball bearings for transmission purposes was staged in the exhibit of the Chapman Double Ball Bearing Co., Limited, Toronto, at the Canadian National Exhibition. Nineteen ball bearings and a number of short lengths of heavy shafting, together with pulley and fly wheels, one of the latter of which weighed in the neighborhood of 500 lbs., were all in operation, the power being furnished by a 1/20 h.p. motor, using a string drive. This load would be equal to about 200 feet of 3" shafting with the necessary hangers and bearings. Needless to say this demonstration aroused a lot of interest, and many favorable comments were made, not only as to the originality of the demonstration but as to the almost frictionless operation of the bearings. Other articles on display included the Chapman ball bearing lift-truck and ball and roller bearings for Ford and Chevrolet cars. Mr. Murray and Mr. Hawkin were in charge of the exhibit.

D. K. McLaren, Limited. The belting shown by D. K. McLaren of Montreal, in their stand at the Canadian National Exhibition made up a very attractive exhibit. Samples and rolls of the various kinds of belting, such as oak tan leather, Balata and cotton, were displayed in a very attractive manner. Other supplies on exhibition included various kinds of lacing, Phillips steel pulleys, wood pulleys and mill supplies of different kinds.

The International Business Machines, Limited. The wide range of time-recording and time-keeping clocks and other special machines for tabulating, sorting and assisting in keeping track of office details manufactured by the International Business Machines, Limited, Toronto, could be gathered from their exhibit in the Process Building.

The time-recording and time-keeping clocks included a full line of automatic and semi-automatic instruments. The automatic clock changes at specified times from "in" to "out," also from shift to shift. A door time clock was being demonstrated which made a record of each time the door was opened. Each employee would possess a key which when inserted in the lock would cause that employee's number to be recorded, together with the time they opened the door. In this way a complete check could be kept on each person, not only with regard to punctuality but also covering any periods during which they might be absent from the office.

Mechanical Leathers, Limited, Toronto. A very interesting assortment of leather products was on display at the Canadian National Exhibition in the booth of Mechanical Leathers, Limited, Toronto. The showing included their well-known Chicago rawhide belting, vulcanite krome belting, hi-grade oak belting, fabri-krome belting and round and twist machine belting. These were shown in various widths. The fabri-krome belting is a combination product having a fabric back cemented and stitched to a chrome leather facing. This produces a medium-priced belt having the strength and power delivering properties of chrome belting. Other leather products shown included rawhide gears, pinions, hammers, mallets, lacing and gear blanks. Also in chrome leather was displayed cups for pumps, valves, washers, gaskets, clutch faces, chrome laces and other articles of a similar nature. Another interesting exhibit was an imitation leather, having a face coating made of a leather product. In appearance this could not be distinguished from real leather and it had the flexibility of the genuine article as well. In this respect it differed from the ordinary imitations which are inclined to crack when creased.

Woodwork Exhibits Arouse Interest

That the public are interested in woodwork and building material was clearly demonstrated by the many inquiries made at the booths of the Laidlaw Lumber Company and the Buyer's Door & Manufacturing Co. These two displays consisted of a wide range of inside and outside doors, newel posts, turned columns, samples of grill and colonade work and other items in high-class woodwork. Many of the inquiries came from people who contemplated building and will, if followed up, likely result in a considerable volume of business being booked. The Canadian National Exhibition offers an opportunity for firms, manufacturing woodwork of all kinds, to arouse more interest in their product. By displaying high-class woodwork in an attractive setting they would be enabled to mould the tastes of the general public, to educate them to the value of fine work and thus increase the demand for better woodwork.

Technical School Makes Display

The practical value of the training given at the Central Technical School, Toronto, could be gathered from the showing made by the pupils of the different classes. In the woodworking line a range of articles including chairs, tables, wardrobes, grandfather's clock, tea waggons and numerous other pieces were shown. When it is borne in mind that these pieces were designed, worked out and finished by the pupils and that in producing these articles they were called upon to make their own drawings, lay off a "rod" and take off a stock bill, it will be seen that the training given covers woodworking in a very thorough manner.

The business man without understanding, without knowledge, belief, sense or reason is at the mercy of every one, including his customers and competitors. He knows not when or where to start nor when or where to stop. He bats about blindfolded, unarmed, in the dark.

Prime Costs in Box Industry

Items which Must be Considered Before True Lumber Cost at Plant Can Be Reached—Storage and Handling Waste No Small Factor

Ascertaining the cost of lumber delivered at planer or saw is not so simple a matter as it may seem. There are a number of important points which must be taken into consideration before a true delivered cost can be calculated. A glance at the following prime cost factors will give an indication of how complicated this phase of box costing is:

Item 1. Lumber replacement value—Note 1.

Item 2. Yard rental or interest on lumber yard land investment—Note 2.

Item 3. Insurance cost on lumber in yard—Note 3.

Item 4. Taxes on lumber holdings—Note 4.

Item 5. Taxes on yard valuation—Note 5.

Item 6. Interest on money invested in lumber—Note 6.

Item 7. Yard labor, including yard teaming costs—Note 7.

Item 8. Total overhead costs—Note 8.

Item 9. Cost of rough lumber to planer—Note 9.

Item 10. Percentage of waste due to manufacture—Note 10.

Item 11. Cost of lumber in 1,000 ft. finished shooks.

Note 1. This figure to represent replacement value of lumber used, before the addition of yard overhead expense and waste.

Note 2. Example: If lumber yard land be owned by box factory, and valued at $2,000, the interest on investment at current rate (6 per cent.) should be considered. ($2,000 at 6 per cent. is $120 per year.) Assuming the average annual amount of lumber handled through yard to be 5,000,000 ft., the charge would be $0.024 on each 1,000 ft. ($120 divided by 5 000 M).

Example: If lumber yard land be rented, the annual rental being $200, the amount of lumber handled being the same (5,000,000 ft.), the charge would be $.04 on each 1,000 ft. ($200 divided by 5 000 M).

Example: If the greater part of incoming lumber be unloaded direct from cars into the mill without passing through lumber yard, the total yard and unloading expense should be proportioned over entire amount of lumber used. Taking the figure of $120 in the first example. The yard storage being but 750,000 ft., the lumber used in mill 5,000,000 ft. (4,250 000 ft. going direct from cars to mill) the expense per M ft. would be the same $.024 per M.

Note: Item 2 should also include interest on money invested in lumber sheds and lumber yard equipment.

Note 3. Example: Lumber in yard 750,000 ft., value $38 per M. Total value for insurance purposes $28,500. Insurance cost at 1½ per cent., $427.50. Annual cut of lumber in box factory 5,000,000 ft. Insurance cost per M $.0855.

Note: Item 3 should also include insurance on lumber sheds and lumber yard investment.

Note 4. Example: Lumber value for tax purposes $25 to $30 per M. Take average of $27.50. Lumber in yard 750,000 ft. Tax value $20,625. Tax rate from $22 to $27.50. Take an average of $25 on each $1,000, cost of annual taxes $515.62. Annual movement of lumber through mill 5,000,000 ft. Tax cost per M $.103.

Note: Lumber purchased but not delivered upon which taxes accrue should be included in this item.

Note 5. Tax rate same as shown in Note 4 (average about $25 on each $1,000). Lumber yard value $2,000. Annual taxes $50. Lumber through mill 5,000,000 ft. Tax cost per M $.01.

Note: In this item should be included tax on lumber sheds and yard equipment.

Note 6. Average (bank) interest charge 7 per cent., but as it be necessary to carry a bank balance of from 10 per cent. to 20 per cent. of the amount borrowed it brings the actual interest cost up to 8 per cent. or more. Value lumber in yard (750,000 ft.) $28,500. Interest at 8 per cent., $2,280. Annual lumber used 5,000,000 ft. Interest cost per M $.456.

Note: Interest on money invested in lumber but not delivered should be included in this item.

Note 7. Example: All yard labor (unloaders, stackers, surveyors, teamsters, teams, trucks and truck drivers) expense should be included in this item. If this charge varies in different seasons, cost average should be taken once a week or at least every 30 days.

1 Surveyor at	$ 28.00
4 Lumber handlers at $26	104.00
1 Teamster at	25.00
1 Team at	36.00
Yard cost per week	$193.00
Yard cost per day	$ 32.17
Yard cost per month (26 days)	836.40

Monthly lumber turn over 416,000 ft. (5 000,000 ft. per year) yard labor cost per M $2.01.

Note 8. In this item show total of all costs itemized, items 2 to 6 inclusive.

Note 9. Add item 8 to item 1, gives cost of lumber to planer.

Note 10. Waste. Unless lumber is surveyed into the planer and a daily waste record taken, frequent tests should be made to ascertain the waste factor. The average waste will be about 17 per cent. To ascertain the cost of lumber in 1,000 ft. of shooks subtract the waste percentage from 100 per cent. (100 per cent. less 17 per cent.) which gives 83 per cent. Divide figure shown in Item 9 by 83 per cent., which gives cost figure to be used in Item 11.

Salesmanship for Box Manufacturers

Real salesmanship as displayed by a few box manufacturers is producing results to-day. Real salesmanship does not mean the sacrifice of quality, mis-cut shooks, indistinct printing and all the other items that make for speed in manufacture in order to meet the other fellow's price. Some of this is being done, but trade secured under such circumstances is not permanent. It is a price meet price, dog eat dog proposition.

When the real salesman comes along such tactics worry and cause trouble, but, that is his opportunity to display his training and he is doing it.

Stop and consider for just a moment the many angles of the selling game. Consider the wonderful opportunity given through handling the package question as it should be handled.

The railroads, trade associations, chambers of com-

merce and shipping organizations are looking to the container manufacturer t ohelp in designing better boxes; boxes that will safely carry the product through to destination. Boxes that will be stronger, that will eliminate danger of pilferage and that will stand the ordinary hazards of transportation. All this can be accomplished and without the use of additional lumber. In fact, the tests made at the Forest Products laboratory demonstrate that in general increasing the thickness of sides, top and botto mabove ⅜ in. does not materially strengthen the box. Thicknesses can be reduced provided cases are properly nailed. The reduction of thicknesses and the addition of a strap or two means a cheaper and stronger container.

The railroads demand that loss and damage claims be reduced. nI the packnig of articles subject to pilferage, the box salesman can show the prospective customer that the use of corrugated fasteners on the inside of a box—the boards in the sides, top and bottom of the ordinary box to be joined with three fasteners in each joint—and if further secured through the use of strapping around each end, will prevent the drawing of nails and sliding of a board to reach contents. The use of corrugated fasteners eliminates the necessity of matched stock (tongue and groove) for butt joints with fasteners give a stronger case than matched stock with fasteners.

A style 2½ box ⅜ in. all around, 13/16 in. cleats, with corrugated fasteners between joints and properly strapped, is a good insurance risk. All shipments do not require such strength, but many heavy boxes used to-day can be reduced in weight.

Think it over. Study the needs of your customers. Study scientific box construction. The salesman that takes advantage of laboratory data and sells service along with his boxes has learned the art of selling in this era of severe competition.

Wood Boxes Won Out

A large wholesale grocery house recently set out to secure the best containers for the products handled and to see that as far as possible manufacturers of lines purchased shipped such goods in suitable boxes. They decided that they would try and have all goods packed in wooden containers. The following extracts are taken from a letter addressed by the general manager of the firm to the buyers:

I am particularly against receiving so many goods packed in paper cartons. Glass goods, green or fresh soaps, canned goods, etc., are being delivered to us in paper containers. Glass goods are easily broken, so they can not be shipped a long distance; green soaps if piled in a freight car with a weight upon them are crushed, and if one or two containers of canned goods swell the whole package is spoiled.

We have recently sent the enclosed letter to our buyers instructing them if they can get away from this abuse to do so.

Here are the specific instructions issued to the buyers:

We are having too many goods delivered in paper containers.

They can not be shipped for export.

They can not be opened for sampling.

They crush easily under the weight of other goods when loaded on trucks, cars or steamships.

They egt wet and show damage.

If they contain liquid or moist goods like soaps or seeded raisins they crumple up.

We can get nearly all goods in wood if we insist on it.

Macaroni, vermicelli, raisins and hundreds of lines we handle can be bought in wood if buyer will think of it and insist on it.

Where it seems impossible to buy at best prices, unless we take containers, then, and then only, we want at least one-half of the order in wood.

You must respect this request and act accordingly. Always ask how goods are packed, put in your contract or order "wood cases only," and have enough sand to stand by your instructions.

Meeting Competition in Box Industry

Secretary H. L. Pease of the National Association of Box Manufacturers, Chicago, recently distributed the following bulletin to members, which not only exemplifies what can be accomplished by studying a consumer's container requirements, but incidentally the value of interchanging information.

"We have received correspondence from members of the association, indicating that our first letter of July 8 in regard to the reduction in thickneses of box parts has met with result. Many of our members, during the past thirty days, have ben able to redesign cases, giving boxes of lighter construction, and through such service have been able to compete with substitute containers. This campetition has not been entirely on a price basis. Selling price must be considered, but strength, serviceability and other factors have played an important part.

"The following from one of our members shows what can be done if a little time and study be devoted to scientific construction.

" 'One of our customers has been using a box with ⅜ in. sides, top and bottom, and 13/16 in. ends, with no cleats. When well nailed this box gave good results, but when tested it failed on the first drop of 36 inches.

" 'We changed the box byq using the same sides, top and bottom, with only half-inch ends, but added two cleats on each end, 1½ in. x ⅝ in.

" 'This box not only stood eight drops of 36 inches, but also eight drops of 48 inches and five of sixty inches before it gave way. Skillful designing produced, therefore, a box two o rthree times as strong, somewhat lighter, and at a saving of 2c per case..' "

Hints for Hardening Cutters

Good tool steel is very sensitive to differences in the water in which it is hardened. The softer the water the better will the tool harden. Too much emphasis cannot be laid on the necessity of having an ample supply of water when hardening high-speed steel tools. If possible it is advisable to have the water running, even if only slowly.

Generally speaking, good tool steel needs no mixtures or compounds or solutions added to the water at all; the purer the water the more satisfactory will be the results. If, however, it is desired to scale a tool for a special purpose, a little salt added to the water is permissible. Of course, sea water is the keenest natural water for hardening, but it strikes too keenly for general use, especially woodworking tools.

When hardening tools in an oil bath, a little sal-ammoniac added to the bath will help cutters to come out with a clean surface.

Machinery & Equipment

Yates Open Back Nailing Machine

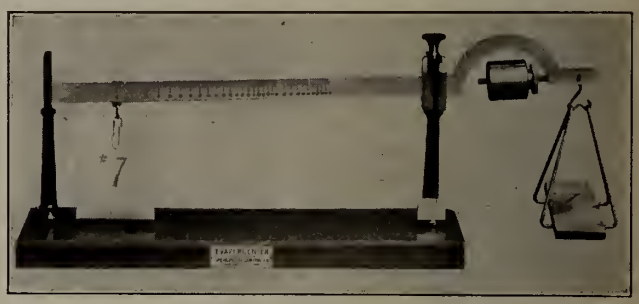
A new piece of equipment in the shape of an open back nailing machine, shown in the accompanying illustration, was recently placed on the market by the P. B. Yates Machine Co., Limited, Hamilton, Ont. This is what is known as a 30 in. machine, and is made in three models—No. 830, No. 930 and No. 1030—which are designed to drive, respectively, eight, nine and ten nails at one operation. As the name implies, anopening has been provided in the back through which the stock may be passed, enabling cleats to be attached anywhere on the shooks. Extreme distance possible between nails is thirty inches, and they may be driven as close together as 1⅜ inches. The driving chucks are atached in two rows, enabling the nails to be driven in one or two rows as desired. As equipped the machine will handle nails from 1¼ to 2 in., but special feed disks may be had for other sizes. A clinching

New Yates nailing machine

device is provided for clinching the nails in batens on cleated boxes. If the nails are not required to be clinched, this device may be rendered inoperative. Suitable gauges are furnished for holding the work in various positions. Special gauges have been designed to gauge the cleats when nailed on the ends of the shooks. While it has been designed primarily for belt drive, provision has been made whereby it may be quickly changed to motor drive. The recommended speed is 500 R.P.M., and the power required is five horsepower.

The National Evapercenter

Many plans have been perfected to determine the moisture content of lumber in process of drying and many of these plans are scientifically correct but are difficult to follow in the field. The "Evapercenter," which is probably the latest device for determining the moisture content of lumber, is so simple, however, that it is easy to operate and may be termed "fool proof." By referring to the illustration, the character



Instrument for determining dryness of stock

of the instrument is easily seen and the method of operation is also fully shown. An envelope is first attached to the scale bar at zero and then the test piece of lumber is placed on the scale. A balance is then secured by pouring "counterweight material" into the envelope until the scale balances. The envelope and the test piece are then removed and the number of the sample plainly marked on each. This operation is repeated on as many pieces as it is desired to test and the pieces are then heated in an oven until bone dry. When dry the test pieces are returned to the scale, one at a time, and the envelopes of corresponding numbers are hung in place. The envelope slide is then moved along the scale until a balance is again secured and the scale reading gives the percentage evaporated from the lumber. By this method the percentage is determined without the actual weight being known. This instrument is being placed on the market by the National Dry Kiln Co., of Indianapolis, Ind.

Automatic Hollow Chisel Mortiser

Herewith is shown an automatic hollow-chisel mortiser built by the J. A. Fay & Egan Co., 153-173 West Front St., Cincinnati, Ohio, U. S. A. It is adaptable for use in carriage, furniture, sash and door plants, cabinet shops and manual training schools.

The column is a rigid casting with broad floor supports. Chisel mandrel runs in self-oiling bearings, mounted in a housing traveling in gibbed ways on column, having a stroke of 4-inch by means of a crank plate, driven by worm and worm gear with quick-acting clutch. Two speeds of feed are provided by means of cone pulleys. The table is 5-inches wide, 36-inches long and has a vertical adjustment of 12-in. by means of ratchet lever; is provided with an automatic disappearing stop guage and arranged to angle 40 degrees either way. Stop guages can be set for several mortis-

es of different lengths, which means saving in time, as this eliminate marking off each piece of stock to be mortised.

The machine is entirely self-contained having coun-

Fay & Egan hollow chisel mortiser

ter-shaft mounted in base with convenient adjustments. It will mortise to a depth of 3½-inches.

Hardware for Factory Trucks

In addition to making a complete line of woodworking equipment the Oliver Machinery Co., Grand Rapids, Mich., are devoting considerable attention to factory trucks and truck hardware. This latter idea should have an especially strong appeal to woodworkers, not only because these parts are being sold on a foundry basis, but because the lumber necessary to build a truck is always available in any shop and the parts themselves weigh less and take a lower classification than the finished article. As will be noticed from the accompanying illustration, everything is shipped complete ready to be attached, even to the bolts and screws. Factory trucks are necessary to the economical handling of stock, and by making them in his own shop, a manufacturer is sure of securing trucks which are peculiarly suited to his own particular requirements.

Foreman and Labor Turnover

Production is the largest recognized problem of the manufacturer. Increased production is the great essential by which success is measured, and only by limiting production does the manufacturer gain or lose accordingly. Therefore, we should not permit a principle so vital pass without considerable and serious thought.

In an effort to increase production much money is spent in developing high standards of mechanical equipment, methods, processes, etc., while comparatively little thought is given to the individual employee who is actually responsible for its success or failure.

A large labor turnover and other labor difficulties are the prime evils which hinder increased production. To the worker the foreman represents the management. The foreman being the bridge or link between the management and worker, consequently should be chosen with great care. He should be endowed, first of all, with a natural broad vision in all things, and should be chosen not only because he is a good worker and understands machinery, but he should know men. More intelligent foremen mean a more intelligent understanding of management and worker.

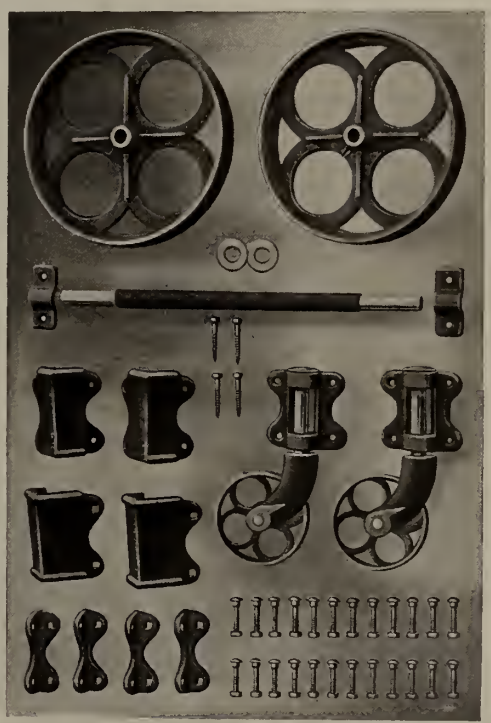
The fundamental policies of an organization should be clearly defined to the foreman and reasons behind these policies should be shown to him. Assuming that the foreman measures u pwell in amount of intelligence, loyalty, understands manufacturing, and has a knowledge of men and how to handle them and knowing the basic principdes and policies of the management, he should be impressed strongly that the burden of increased production rests entirely upon him.

The management should constantly keep its foremen on "their toes" so to speak, by impressing upon them that the most important of all things entering the race for increased production is labor, and that a large labor turnover is not conducive to increased production.

The foreman should be taught to make a systematic study of the men under him, and if there is a man in his department whom he considers a "weak link" in the chain necessary for increased production, such man should be replaced by another man or stronger link.

Williamson Veneer Appoint Representative

The Williamson Veneer Company, Baltimore, Md., announces an addition to its selling force which will undoubtedly be interesting to the trade. H. F. Wilke of Chicago was for many years associated in the selling capacity for George W. Stoneman & Co. of Chi



Illustrating "Oliver" truck hardware

cago. One of the most valued lines of veners handled by the Stoneman Company was that of the Williamson Veneer Companl, with which Mr. Wilke was personally very closely associated. With theestablishment of direct sales offices six o reight months ago, the Williamson product is now being marketed in the middle western territory through its Chicago office, 28 East Jackson Boulevard. Mr. Kilke will be one of the middle western representatives, being associated in this territory with R. J. Cavanaugh and C. S. Connor.

Upholstering and Trimming

Modern Upholstering

How Back is Upholstered When Springs Are Not Used -- Treatment of Arms and Wings

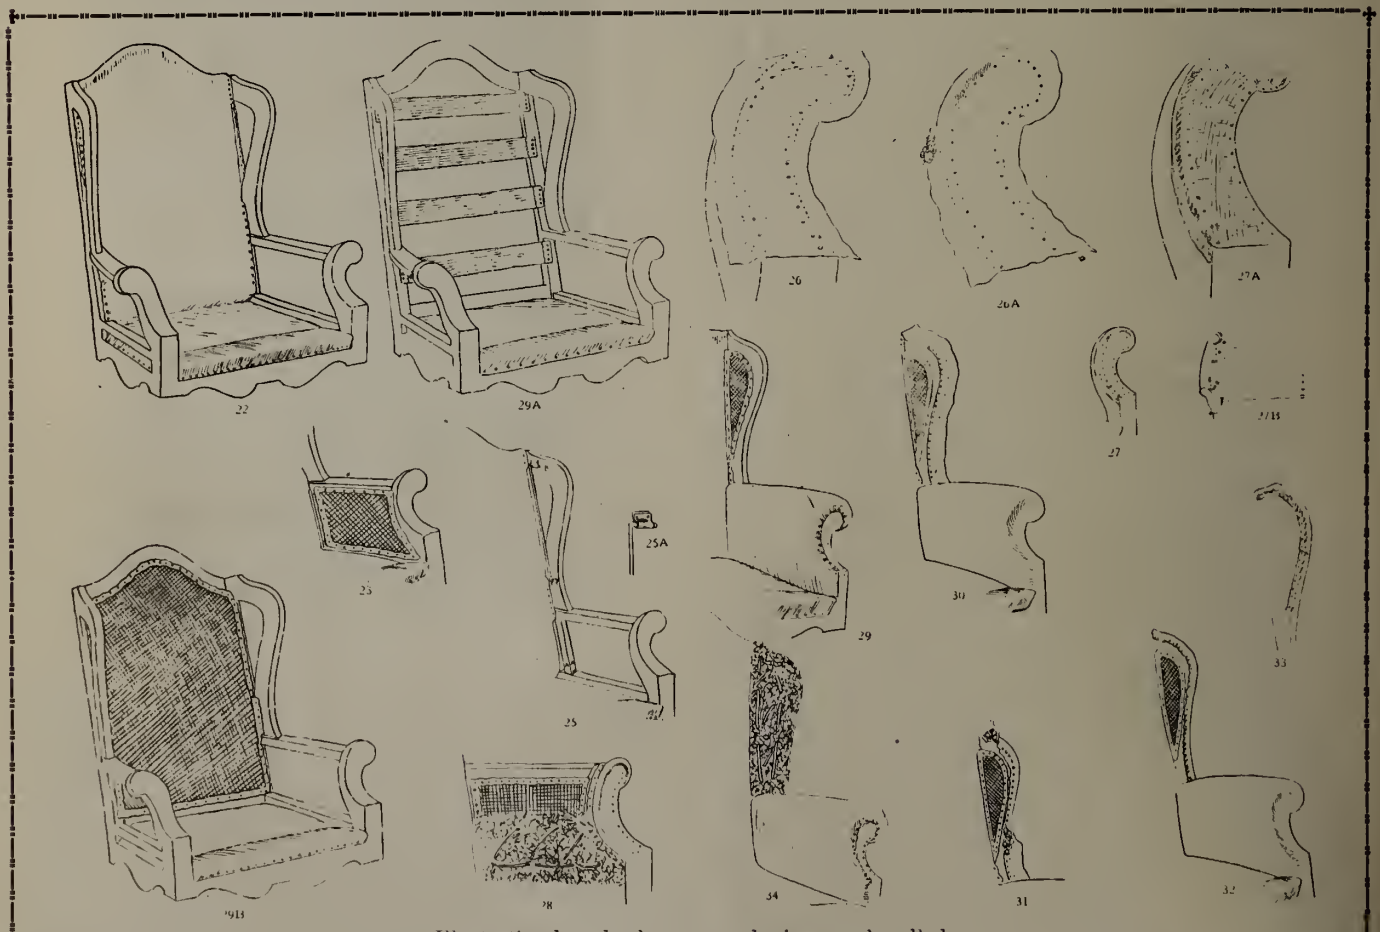
As mentioned in a previous paragraph, there is a way of upholstering, without springs, the back of the chair we are describing. In such a case, four or five rows of webbing are attached to the face of the back, as shown in Fig. 29a, and a stout canvas is stretched over the webbing, a sFig. 29b. The webbing should not be stretched to its utmost possibility, but should be allowed to retain a certain amount of its natural elasticity, permitting the back to give slightly under pressure, without creating an unsightly bulge at the outside back of the chair.

After the canvas is attached the chair is upholstered in the same way as described in connection with Figs. 17a, 17b, 17c and 18. This gives the appearance of the chair now shown in Fig. 22.

The next step in the upholstering of this chair is the treatment of the arms, which must be canvassed, as indicated in Fig. 23. Some support, however, must be provided for the bac kedge of the canvas so that, between the upholstering of the arm and that of the back, a crevice will be left through which the back edge of the arm covering may be drawn.

This support may be provided in either of two ways; by tacking a wire, as shown at "b" in Fig. 25, or a block, as shown at "a" i nthe same diagram. The method of attaching the wire is shown in enlarged detail in Fig. 25a. Where the wire is used the canvas is passed around and sewn with long stitches while the balance of the canvas is tacked in the regular way.

The next step is the formation of the nosing around the inner edge of the arm. A piece of canton flannel larger than the face of the arm is tacked, as indicated in Fig. 26, keeping the tacks about one-half inch from the edge of the arm. The surplus material, which goes beyond the edge, is then stuffed up to form a nosing, as indicated at "x" in Fix. 26a. This diagram shows the commencement of the nosing. The stuffing is continued down on the inside edge of the arm to the point where it joins the seat and is continued also around the top curve of the arm, diminishing in size until it practically dies away at "a." No nosing is provided on the edge between "a" and "b" for this type of chair, but the surplus material is carried around the edge and tacked to give a finish.



Illustrating how back, arms and wings are handled.

After the nosing has been entirely formed, it is regulated into shape and stitched so as to have the appearance of Fig. 27. Note also the enlarged detail diagrams 27a and 27b, which give a clearer idea of the stitching.

The next step is the lacing on of the hair, as shown in Fig. 28, the compact mass being kept uniform and carried up over the top of the arm smoothly, so as to produce, in the muslin, the shape shown in Fig. 29.

After both arms are done, the wings are next in order, these being first canvassed, as shown in Fig. 29. Then the flannel for the nosing is back-tacked on the edge of the wing, as shown in Fig. 30, and this also is stuffed up and tacked to provide a compact, smooth edge, as indicated in Figs. 31 and 32, and in the stitched form shown in Fig. 35.

The operation of forming the nosing can be reversed by tacking the inside edge of the flannel, then stuffing it and tacking the outside instead of back-tacking the outside edge, stuffing it and then tacking the inside, which is shown in connection with these figures, and an equally satisfactory job can be done either way.

(To be continued)

Upholstering Material Market

It has been suggested that upholstering fabrics may be scarce and difficult to secure this Fall. The mills have boked a fair volume of business for Fall, but evidently not one that will be equal to the needs of the trade for the Fall season. It is remarked that the buying conditions have been such that when the retailing and selling season is well under way there is likely to be a shortage of some of the wanted fabrics and patterns. The department stores have been purchasing in this line in about the same proportion as throughout the entire drapery field and no doubt reorders will be the rule. A considerable business has been booked from furniture manufacturers. The Philadelphia mills are working quite actively on orders in hand. They have been offering a wider selection of patterns than usual and buyers have naturally spread their purchases over a wider range of designs, which with but moderate average aggregate purchases, means a small representation of each pattern. A considerable quantity of imported material is coming on the market. This includes new ideas in French and English cretonnes and linens, glazed chintz and toile de jouy. Lamp shade manufacturers will find attractive assortments of galloons, tassels, fancy nets, and plain and figured silks.

Colors in Furniture Decoration

At a recent furniture exposition, exhibits which showed the use of color in the decoration of the furniture displayed proved to be extremely popular.

Color in furniture decoration is as old as furniture. The ancient Egyptians and the Greeks and other peoples of antiquity made a greater use of color than we do today. The spirit of the whole Renaissance was for form and color suffered so largely, that even today we are far less venturesome than our ancestors.

In the early English periods, chests and coffers were noteworthy for color decoration. Up to the time of the Puritan regime, color held its own but Puritan austerity frowned upon it. After the Restoration color came back into its own in the William and Mary period but the influence of Chippendale, who was primarily a wood carver, acted against the use of color. When the style of the Brothers Adam succeeded Chippendale's influence, color regained its place.

On the continent of Europe, color always played a big part in furniture decoration except as the spirit of the Renaissance for form crowded it out. Among the legacies which the Bavarians brought to America was this use of color and all down through the Cumberland Valley of Pennsylvania and in other parts of the state settled by the early German immigrants, dower chests, cabinets and other articles of furniture show this influence and are richly colored.

The growing popularity of the so-called breakfast room suites has been a big item in the increase of the use of color in enamelled furniture. The "parchment" and other like finishes are evidences of the same growing popularity of color in furniture decoration.

Color has maintained its hold under discouraging conditions and with favorable conditions will prove its worth and win great popularity.

Asssciation Officials Tour Ontario

A number of the officials of the Furniture Manufacturers' Association recently motored through part of Western Ontario, calling upon the furniture manufacturers, in the interests of the various activities of the association. It is proposed to continue these trips until the whole province has been covered. Those making the tour are:—J. H. Baetz, chairman of the association; Wm. Cawkell, secretary; Jas. E. Ferguson, in charge of the cost accounting department, and T. Lyle Blogg, manager of the Home Furnishings Bureau.

Upholstering Springs

6½ cents per pound

Any Size, Height or Gauge

Securing Satisfactory Enamel Finish

Enamel and Polychrome Finishes Becoming Quite Popular

By R. A. Telfer

Enamelling is one of the processes where each artisan and even each finishing room may have developed special methods. It is said that some of the factories have carried this development to a great degree and that in them the process of enamelling is specialized and particular in most respects.

The foundation of all good enamelling is a surface which will carry the enamel in the right manner. This is as important as the foundation of a skyscraper is to the integrity of the superstructure it carries. Just as the sturdy foundations of a giant building must not fail in any particular, so, too, must the surface upon which the enamelling is done maintain a lasting uniformity of the right kind.

Surface Should Be Perfect

All indentations in the surface, all cracks and crevices of every nature, all nicks and other irregularities, must be filled in and sanded smooth. The surface is then, generally, treated with a base filler which is allowed to dry thoroughly, the time varying from one to two or more days. Many finishing foremen then put on what is known as a shellac wash which is very thin. The surface is again sanded and thoroughly dusted.

The first undercoat is then applied. Undercoats are made from basic materials which are grounded in a specially treated wood oil. These materials, which are used as the bases of first coaters, are very dense pigments and form a foundation for the succeeding finishing materials. The undercoats play the same important part as do the elements which bind together the foundation stones of a building, cementing the foundation into one solid and smooth and even mass upon which the superstructure can be builded with every guarantee of permanency and endurance.

Two Applications of Undercoater

Two undercoats are usaully applied. The first coat is usually thinned out in order to permeate the wood fibres and bind firmly into them. The second coat is heavier, as it has the first coat upon which to stand. The first coater is sometimes tinted toward the final color of the finish and the second is made as near the desired color of the final finish as it is possible to color it. Ivory is obtained by tinting the coaters yellow, red or orange.

When a satisfactory job is obtained by the use of the first coaters which bind firmly into the wood fibres and make a lasting uniform surface which is full and yet transparent and which allows the firm adhesion of the succeeding finishes, the job is ready for the immediate process of enamelling.

Proper Brush Important

The enamel is flowed on with a chiselled varnish brush and is put on thin. Extreme vigilance should see that the worker uses the proper kind of a brush. Most foremen have found that a better-than-usual bristle brush is less expensive in the end, even if the initial cost is larger. Enamelling is one of the processes where good tools in the shape of proper brushes are necessary to real good jobs. Too much saving is not true economy in this particular case.

The good enamels are easy to apply. They do not streak and the brush marks are not visible. The enamel should not set too fast, giving the coating the chance to flow out smoothly. Climatic conditions and temperature may affect this part of the job and conference with experts at the finishing product company's headquarters is sometimes advisable. Wood finishing companies have laboratories and chemists who are ready to serve the users of their products and conferences with them solves many problems in the finishing room, not only in regard to enamelling but also concerning many other processes.

Pure white enamel which sometimes gives a sickish appearance is sometimes strengthened by the addition of a blue coloring material. Undercoaters and enamels are mixed to obtain certain results.

Properties of Good Enamel

A good enamel has a firm color and a sufficient body. It flows freely and spreads with ease. The good enamel dries steadily and does not lose its luster in the drying. The final finish is porcelain-like and does not chip or crack. The color is preserved in the final finish of a good enamel and there is no suggestion of a pink or blue cast.

Final finishes of enamel are egg-shell, satin and gloss. The egg-shell is similar to a rubbed finish. The satin finish is obtained by rubbing with powdered pumice and finishing off with a rubbing of oil or water. Rubbing felts are soaked with the water or oil and dipped in the pumice. Care must be taken to remove all dirt or dust marks. Enamel is usually allowed to stand six or seven days before being rubbed.

Polishing Final Operation

Polished finishes are obtained by polishing with rottenstone and finishing with oil or water. For this a soft cloth, such as cotton waste, is saturated with the oil or water and dipped in the rottenstone. The rubbing continues until the desired high lustre appears. The rubbed finish is then allowed to stand for a period before polishing.

Lemon oil is sometimes rubbed over the entire surface and wiped off with cheesecloth that has been dampened with alcohol, great care being exercised not to use too much alcohol which would burn the finish. This rubbing is done as rapidly as possible.

Enamelling is a process which demands care and study. A poor job is perhaps among the most noticeable of failures in the manufacture of furniture. The progressive manufacturers of wood finishing products are ready to consider the problems which the finishing rooms of furniture factories present to them and by a close co-operation the integrity of good enamelling is constantly maintained.—"Furniture Factory."

Varnish Ills and Antidotes

Blistering—Several causes, chief among which are oil, grease or moisture under the varnish coat; if the wood was not dry before application of varnish, and heat comes in touch with it, the varnish is likely to raise up.

Blooming—The finer the varnish the more sensible to bad air. Ammonia fumes very bad. New varnish may bloom. If any adulterated oil has been used beneath the varnish the latter may bloom. Undry undercoating a cause. Too much drier in the varnish bad. Bloom is like what you see on a ripe plum, and it may be removed by washing in cold water.

Silking—The surface looks like silk, hence the name. There are several forms of silking, as enameling, its lightest form; may come from working in a cold room or applying varnish to a cold surface, exposure to cold draft of air during its application, undry undercoats, or to adding turpentine to the varnish.

Bubbling—If your varnish happens to be a little warm small bubbles are likely to form on the coating of varnish, but this is easily rectified by cooling the varnish.

Mixing Dry Materials

Dry pigments, such as umber, sienna, lamp black, etc., are mixed with difficulty; but, by adding a small amount of alcohol, and working to a paste, they will then readily mix with oil.

Dry colors, as above, when needed for water colors, will mix and work better if made into a paste with either vinegar or alcohol, before thinning out with water. However, if these colors are to be used with an air brush, don't use anything but water.

If there are any odd lots of hard lead, zinc or paint, (or paint skins) run them through a meat cutter (such as is used by the household), and if particularly dry, add a small amount of linseed oil, and by this means of working up, all this old stuff, it will be readily made over into usable material. It may be necessary to run some of it through the machine twice to get a perfectly fine product.

Another plan for softening up old putty is to place the putty in warm water, and leave it on any heating system, in order to keep the water warm, and after the putty is warmed through, it can be easily worked up into a working consistency.

A Warning

A subscriber has written in suggesting that we warn our readers to be on the lookout for a man by the name of "Campbell," who is calling on the different woodworking plants selling formulas for celluloid and enamels. This chap is very plausible and tells a good story, but as the formula has proved to be useless, the addresses he gave fictitious and none of the firms mentioned as being able to supply the necessary raw material know Mr. Campbell nor have heard of the products mentioned, it would appear as if this man is an out-and-out faker.

We quote from a number of letters received from supply houses in the States:—"We are sorry to have to advise you that we are not in a position to supply metal dyes. As a mater of fact we do not know what these preparations are. In this connection we would mention that we have received numerous inquiries from concerns who have, apparently, received some formula from a Mr. Campbell, but have no idea what is referred to. We have endeavored to get in touch with this man but have been unsuccessful in our attempts to find him."

"You have, undoubtedly, been referred to us in error by Mr. Campbell, as we neither manufacture nor handle P. and L. flake white or wood dyes soluble in methyl acetone. It seems that this Mr. Campbell has been travelling throughout the States and Canada selling formulas for making celluloid enamel, and we cannot understand his reasons for referring people to us. We do not know the man and have been unable to locate him at several addresses which he has given, and while he may have acted in good faith, we are inclined to believe that he is an imposter."

The following item taken from the "Oil Painted Drug Reporter" of September 9th, 1918, would seem to indicate that this man has been at this game before. The item in question is headed "Warning," and goes on to say that an individual using the name of "Campbell," and claiming connection with the firm of John Campbell & Co. of Newark, N.J., has been travelling throughout the country selling formulas and recipes for lacquers and finishes made from colonial products. We have received numerous letters of complaint and wish to inform the trade that this man is not and has not been in any way connected with our firm."

Portable Spray-painting Equipment

The DeVilbiss Mfg. Co., Toledo, Ohio, recently issued a circular covering their improved portable spray-painting equipment. This is suitable for painting the interior and exterior of industrial public and residental buildings of all kinds. The equipment is put up in different sizes, including hand truck outfits for one and two operators up to a Ford truck outfit.

It would appear as if the spray painting of large surfaces is rapidly replacing the slower and more costly hand brush method. Paint may be applied by this method three to five times as fast as with a brush. The loss of time required to dip the brush and the continuous refilling of the paint pail is done away with. Another feature is that spray equipment is just as efficient in difficult ad out-of-the-way places as on flat plain surfaces.

While the class of work being done and the kind of material being applied govern the surface which may be covered, it is estimated that one man can paint 500 feet in an hour.

Wood Composition

A very good wood composition can—writes a correspondent—be made as follows: Take about 28 per cent. by weight of powdered lime, which must be freshly slaked; to this add about 2 per cent. of powdered alum and 20 per cent. fresh, strained cattle blood. Stir well together and mix into the liquid as much fine sawdust as it will carry, stirring and adding the sawdust until the composition is fit for use. It is not advisable to use sawdust made from any resinous wood, as the action of the lime affects it.

Comparing Different Stains

Water or acid stains, owing to their slowness in evaporation as compared with oil stains which contain very volatile solvents, will go on and stain wood with a far less tendency to streak. Alcohol or spirit stains are the worst offenders in this respect, owing to the very rapid evaporation of the solvents.

Linseed Oil has its best equivalent in "FLAXICON." Either in boiled or raw, is elastic, durable and waterproof. Working to the best advantage with colors ground in oil.

Meeting Present Conditions

By W. WARREN

In the woodworking industry we are confronted with conditions totally different to any before experienced. To-day efficiency is the factor which often decides our success or failure.

In thinking of efficiency we must not think of it in a theoretical or superficial way but must apply it to our needs in a practical manner. An efficient workman receives greater remuneration than his less-efficient brother; an efficient firm gets greater and more profitable patronage on account of their standard of efficiency and so the value and effect of this quality can be traced throughout our whole operation. Efficiency is the ability to render adequate and satisfactory service, not ordinary, average, every-day service, but extraordinary service. Nature has placed within us the power to give this type of service. Every piece of work or order we get is secured in the face of keen aggressive competition. The margin or difference between cost and selling price has very nearly disappeared. This is the buyers' day.

If we sell millwork and lumber without service we will soon be without orders. If, on the other hand, we sell efficient service as well, it will bring us many orders that would otherwise go to competitors.

Under existing conditions it is almost impossible to operate profitably. Dividends, if secured, will be the result of the efficiency of our operations. Cost of manufacturing and handling has been abnormally high and must be reduced to a minimum.

The length of time taken to execute an order has in the past been too lengthy. We must be prepared to meet even unreasonable demand of exacting customers. The time was when the cutsomer had to await the convenience of the mill, yard or factory. Things have taken a right about face. Any delinquencies on our part will work out to our advantage.

Individual efficiency coupled with an earnest desire to interlock and co-operate will bring out and develop a smooth-running and efficient organization. One that will reap, at least, all the advantages which existing conditions may offer. May I then suggest that we carry on a campaign of efficiency, endeavoring to round off every corner, reduce the cost of handling ann cost of manufacture, increasing our output, execute our orders more promptly, using every means at our disposal to reduce costs and serve the public better. Our value to our employees is just what we are worth ourselves. Service and reward between employee and employer is equal, as is also service and patronage between buyer and seller.

Your assistance and co-operation is requested in an endeavor to make our plant the most efficient of its kind.

Furniture Cannot Go Much Lower

A bulletin recently issued by the Department of Labor, which gives a comparative statement of wages paid in all lines of industry both in this and foreign countries prior to, during and following the war period shows that in November of last year wages in the furniture and cabinet field labor was receiving an average of 126.9 per cent. more than it did in 1914.

Statistics compiled by Associated Furniture on June 1st show that the average reduction from peak wages has been 15.6 per cent. on skilled and 17 per cent. on unskilled, which would leave the wage level at the present time 105.3 per cent. over pre-war scales.

Nichols Varnish Drying Equipment

A complete unit of fan, motor, heaters, air compressor, with automatic temperature and humidity controls for the correct drying of all coatings on the finest pianos, talking machine cabinets, furniture, automobiles, etc. A new humidifying air washer, which eliminates all dust and dirt, does away with all spray heads and connecting piping.

Will triple the output of your finishing rooms; decrease the congestion in your factory; reduce investment of goods in process and improve working conditions for your employees.

Better finish, scientifically dried from the inside out.

We will analyze conditions in your plant and submit a proposition covering an equipment suitable for your requirements, whether it be for automobiles, talking machines, pianos, furniture or railroad cars.

We have exclusive authority to issue license to use the Grosvenor Process Patent in all territory East of the Mississippi, Ohio and Detroit Rivers in the United States and Canada, the only varnish drying process that simultaneously subjects the coatings to the action of moisture in excess of natural humidity.

We also manufacture the Nichols Lumber Dryers, Veneer Dryers and Hydraulic Pumps. It will pay you to address us for further particulars.

Increasing the Speed and Decreasing the Cost of Your Finishing Room Operation

How practical, how advantageous and how dependable DeVilbiss Spray-painting equipment is, has been demonstrated in finishing rooms of every size and line.

Not merely in dozens of finishing rooms, but in thousands of them. Not only where a few different kinds of articles are handled, but where every kind, size and grade of wood or metal product is finished. Not alone where varnishes, enamels or lacquers are used, but where every kind of liquid finishing material is applied.

DeVilbiss
Spray-painting System

offers a complete, adaptable and guaranteed service. The finishing operation is speeded up 4 or 5 times over hand-brushing. A perfect, uniform coating is applied on all jobs. Working conditions are made more healthful and safer. Operating and upkeep costs are reduced to the minimum.

With your consent, we'll gladly tell you whether and how the DeVilbiss System can be of service and profit to you.

Can Warping be Eliminated?

Moisture Cause of all Such Movement, Controlling Moisture Content Should Eliminate Warping and Twisting

By S. H. Johnstone

The discussion on the Science of Moisture Control, by J. F. Hirt, which was published in the July and August issues of the "Canadian Woodworker and Furniture Manufacturer" opens up a new line of thought. If we can at all times control the moisture content of the veneer and plywood, we can control and eliminate all warping and checking during manufacturing operations. Controlling the moisture content of the stock does not present any insurmountable difficulties and the results to be achieved are so alluring as to warrant our earnest consideration.

In discussing this subject Mr. Hirt emphasized the fact that the moisture content of wood tends to stabilize or equalize with surrounding atmospheric conditions, i. e., humidity and temperature, in our plants would result in all stock going through, tending to reach a uniform percentage of moisture content. This is not new theory but has been proved under many and varying conditions. It means that by controlling or conditioning the air in certain departments of our plant or in the whole factory, we can control and determine the moisture content which the stock would ultimately reach if exposed to such constant conditions for a sufficiently long period of time. Again by maintaining the relative humidity and temperature of the air at some pre-determined point, we automatically fix and hold constant the ultimate percentage of moisture content the wood will reach.

Controlling Moisture Content

Now for the practical application of these facts and suggestions. What can be said of one phase of wood manufacturing operations can be adapted to other phases of the same work. We will attempt to apply this idea to veneers and veneered products. In the first place warping, cupping, twisting, checking and similar troubles occur when wood is either absorbing or giving up moisture. As has been pointed out, stock exposed to uniform atmospheric conditions will reach a constant and fixed percentage of moisture content and that moisture content will remain fixed as long as the humidity and temperature of the air do not change. In other words, when lumber reaches the state in which the moisture content is in equilibrium with surrounding atmospheric conditions, moisture will neither be taken up or given off as long as the atmospheric conditions are held constant. Then, if we adopt a standard, it might be 4 per cent. or it might be 6 per cent., and see that all stock is dried to that standard and that the atmospheric conditions in the plant are such that wood dried to that standard will be in equilibrium with the air conditions in the plant, have we not succeeded in securing what might be termed ideal conditions; conditions under which the moisture content of the wood will remain constant and warping, twisting etc., will be entirely absent? The only unfortunate part is that at certain times and during certain operations the moisture conditions are beyond our control.

As yet we are not able to control the conditions to which the veneers, plywood, etc., are exposed while being transported from the manufacturer's warehouse to our own. Someone may suggest that we do not know the conditions under which the material is manufactured and stored. That is true, but as many reliable manufacturers of veneers and panels will guarantee the moisture content of the stock at the time of shipment, we can, if we are fortunate enough to be dealing with such firms, depend upon the stock having been in the desired condition when it was shipped. Perhaps some day this material will be forwarded in hermetically sealed tanks or packages. Until that time arrives, we must take for granted the moisture content of the stock maching our factory is an uncertain quantity.

Redrying is Necessary

To overcome this uncertainty and to prevent complications later on, we must resort to redrying. There are many ways in which this may be accomplished, and it matters little which way we adopt as long as we succeed in securing uniform results. Even though we make a practice of redrying, it is a good policy to give some attention to conditions in the veneer storage room or warehouse. If we permit the stock to become too dry, the loss from split and broken pieces will be unnecessarily high, while if the place is damp, we may be bothered with wrinkled and buckled stock and perhaps a certain amount of mould.

Another time we are confronted with large quantities of moisture is during jointing and laying operations. As long as we use glues containing water, this condition will prevail. To counteract the evil effects of this excess moisture, we must have the stock well dried before gluing, rush the material under pressure as quickly as possible, then after the pressure has been removed, see that the work is held flat and true until dried.

If that is done, we will find that we have nice straight material and as we are again in control of moisture content and atmospheric conditions, we are again masters of the situation and can keep the stock straight and true through all subsequent operations. After all, as stated before, there are no insurmountable difficulties to overcome. It simply requires initiative and a good ventilating and humidifying system.

The real educated man is he who can think out an idea and use his hands and his tools to realize it.

Speeding up old machinery increases the risks of breakages and stoppages. Averaging these up, it will be found that what is gained one way is lost in another

How Do You Sand Core or Face wood

Is one drum with coarse paper better than three drums—Dull paper does uneven work—Stock should be dry for best results

By Arnold Forget

In the past the general practice in sanding corestock in preparation for the face veneer has been (when the drum sender has been used) to use only one drum, with coarse paper, leaving the other drums out of commission. Some recent experiments have shown that a better way is to use all three drums, using the same grade of paper on each and taking a very slight cut. This has more than one advantage over the one-drum method. Where one drum only is used and a heavy cut taken, the paper cuts deeper into the soft parts of the wood than it does in the hard parts, and consequently leaves an uneven surface. For that reason the three-drum method is advised because it leaves a more level surface.

Another advantage is the saving on the paper, because the extra strain on the paper in the deep cut of the one-drum method is out of proportion to the work it does. By using three drums the same quantity of paper will do approximately four times the amount of work that can be done when only one drum is used. This saves not only sandpaper, but also the time required to replace it when worn out.

Securing Best Surface

The same argument applies to the sanding of face surfaces, especially oak, with its extremes of hard and soft places. To make anything like a good job on the face of sawn oak veneer it should be sanded twice unless first scraped, and I would say that it should always be scraped to make it perfectly level, and then sanded lightly with fine paper. The advantage of this will be appreciated by the finisher, who will find that on a surface thus prepared he can produce a better finish with two medium coats of varnish than he can otherwise produce with three heavy coats. The extra time required to properly prepare the surface for the finish is not an expense, but a saving—a big saving of time and material in the finishing room, much greater than the extra cost of doing the work right in the machine room.

It is not economy at any time to continue to use paper after it has become worn dull. Some have the idea that a dull, coarse paper will take the place of fine paper. It is true that a dull paper will make a surface smooth to the touch if sufficient pressure is applied, but it is more a polishing by friction process than one of cutting to a smooth, level surface, and in so far as the evenness of the surface is concerned the last state is likely worse than the first because the extra pressure has been more effective on the soft than on the hard spots, and made them low.

A dull paper following after a coarse paper will not remove the scratches made by the latter, and that is what the fine paper is expected to do. The coarse paper is expected to cut down all raises and make the surface level, and the fine paper to remove the scratches, and if the last paper will not do this the time and effort are wasted. One should fight shy of everything that leads to false economy in the use of sandpaper. Economy is a good thing to practice, but it must be true economy; otherwise it is the opposite sailing under a false name. It is not economy to save a dime in sandpaper, and in consequence lose several dimes in the finishing room.

Have Material Thoroughly Dry

While on this question it might be well to caution against the all-too-prevalent practice of sanding veneered stock, both crossbanding and face, before it is properly dry. It is seldom that face stock is sanded so soon after leaving the press that the friction heat of the drums will soften the glue, but it frequently happens with crossbanding in preparation for the face veneer. Sanding for the face veneer should not be done inside of two or three days, and then only where the stock has been subjected to the most favorable drying conditions. In the case of face veneer the stock should be thoroughly dry before sanding in order to insure a fine job. I remember a man who sanded the stock as soon as possible after it left the press, and gave as his reason the fact that the stock warped, and he had to sand it at once to prevent cutting through th edges which raised up. Of course, he had never been able to get a good finish on his work, but preferred a poor finish to having the veneer cut through. In that he was right, but it was not necessary for him to sacrifice in either respect. We persuaded him to try piling his stock with strips as soon as it left the press, instead of tight, as he had been doing, and allowing it to dry out well before sanding. He did this, and, needless to say, he was able to get a better finish on the dry veneer, and the stock did not warp.

Direction in Which To Sand

In sanding corestock there may be some advantage in sanding at an angle, but for face work it should be run through the machine straight with the grain. By doing this one will avoid the danger of cutting deeply into the grain crosswise and leaving scratches difficult to remove by the fine paper which follows the coarse. There are times when it is necessary to sand across the grain, as on mouldings and ogee work. Much of this work is done by hand and the paper should not be very coarse nor the pressure great. If care is exercised no harm will result. Flat surfaces veneered with crotch should receive as little sanding as possible to get along with. This work should be made smooth and level with the wood scraper and then finished with fine sandpaper with very light pressure, for, like oak, it is made up of many textures, and heavy pressure will make it uneven again.—"Veneers," Indianapolis.

Stop the Belts Slipping

I have known belt slip to reach as high as 25 per cent. and the operator be unaware of it. It is generally the better policy to assume that every belt is a slipping belt, then one is pretty sure to be on the safe side and, incidentally, very near the truth. For certain it is that greatly enhanced all-round results can be secured if every belt is treated as if it is the one and only culprit, irrespective of what prima facie evidence shows. I am an ardent advocate of a non-slipping belt. I don't mean a tight belt, but a belt that is treated or dressed on its working face so that it won't slip even when it is slack.

Know that your raw material is right and will be delivered promptly

The operations of the Wood-Mosaic Company function with precision because every step has been part of a well-conceived plan. The basic thought is a plant for each type of production. Thus, every foot of Wood-Mosaic hardwood lumber and veneers in walnut, oak and poplar is produced in a plant designed especially for the manufacture of each class of product.

This holds from the logs, which are the careful selection of a trained corps of twenty timber buyers, through the final operations of handling the manufactured product, special equipment having been provided for each unit of manufacture so that the lumber and veneer product may be always correctly dried and further prepared for consumer's use. We solicit the opportunity of demonstrating the value to you of such an organization.

ALGOMA *the Better* Plywood

A first impression which lasts

A good first impression, joined with genuine character, has always been the surest combination to win admirers.

This fact is as true of furniture and wood products, as anything you can name. For that reason, we give particular attention to the surface—in the matching of grains. Our veneer woods are chosen from the the finest sources, domestic and foreign. And our men are trained for remarkable skill and care in the matching of grains. Then a rigid inspection of finished panels keeps Algoma Panels up to the highest standard of beauty which fine woods can offer.

Beneath this surface is tne character which makes Algoma the Better Plywood. Order from Algoma for your next job, and "Algoma Plywood" will become your standard.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

Casein Glue Durable in Damp Places

Casein glues are as a class more water-resistant than animal and vegetable glues, but they are not, strictly speaking, waterproof. There is no glue that is waterproof in the sense that it is absolutely unaffected by water after a long immersion. Nevertheless, there are casein glues that are so water-resistant that plywood glued with them will withstand soaking for many weeks in water or exposure for many months to a warm, damp atmosphere. Under similar conditions, animal and vegetable glues would lose their strength in a comparatively short time.

When casein glue joints are kept fairly dry, they con be expected to retain their strength and remain unchanged for an indefinite period, as is the case with animal and vegetable glues. Water-resistant casein glue in a joint, kept constantly wet, will after a long time weaken. but it will ordinarily regain a great deal of its strength if the joint is dried. In a study aimed to discover the reason why casein glues ultimately decompose when kept moist, the Forest Products Laboratory found that under certain conditions the decomposition seemed to be due to a hydrolysis of the casein, undoubtedly brought about by the sodium hydroxide that is always present in casein glues.

This explanation when published was misunderstood to some extent. It should not be taken to mean that casein glues are unreliable, and not durable enough for use in manufacturing plywood and other glued products. On the contrary, casein glues are considered as permanent as any under dry conditions, and the water-resistant casein glues are more permanent than animal or vegetable glues under wet or damp conditions.

Screw Holding Power of Plywood

If the screw fastenings in plywood construction are to be as strong as the plywood itself, it is important to adapt the size of screw, spacing, and margin to the particular species and thickness of plywood used. Tests made at the Forest Products Laboratory have shown that the commonly-used plywood species may be divides into the following groups. Those in any one group requiring the same screw fastener to develop maximum strength:

Group I—Low Density

Basswood	Douglas fir	Pine, white
Cedar, Spanish	Fir, true	Poplar, yellow
Cottonwood	Hemlork	Redwood
Cypress, bald	Pine, sugar	Sproce, Sitka

Group II—Medium Density

Ash, black	Gum, cotton	Mahogany
Ash, pumpkin	Gum, red	Maple, soft
Elm, white	Hackberry	Sycamore
Gum, black	Magnolia	Walnut, black

Group III—High Density

Ash, white	Birch	Elm, cork
Beech	Cherry, black	Maple, hard

The screw sizes, margin, and spacing for use with each species and plywood thickness will be found in the following tables. The gauge is the smallest that can be used with the thickness specified and not cause failure through breaking of the screw when the full strength of the plywood is developed. The length the screw is the shortest which will prevent the screw from pulling out before the full plywood strength is reached. The margin is the smallest distance from edge of hole to edge of plywood which will insure against failure by shear. The spacing is the distance from centre to centre of screw holes which gave maximum strength per linear inch.

About equally good results were obtained with flat-headed screws without washers and round-headed screws with washers. Round-headed screws without washers proved an inferior means of fastening. The spacing given in the table is for screws in a single row. but staggering is recommended wherever possible.

In the tests the size of frame members to which the plywood might be attached was necessarily a secondary consideration, and the block of wood in which the screw points were held was simply made large enough to prevent failure occurring in it. Until further information is obtained, designers must take particular care that the frame is not split or weakened through the use of the size of screw and the spacing necessary to make the fastening as strong as the plywood.

Size and Spacing of Screws for Maximum Strength in Plywood

Table giving data covering various woods

To Reduce Time and Cost of Air Seasoning

In co-operation with the sawmills and wood utilization plants throughout the country, the Forest Products Laboratory, Madison, Wisconsin, is organizing an extensive field study on the air seasoning of wood. This study, it is believed, will be of extreme interest to the lumber manufacturer and to the wood-using industries. The purpose is to determine the piling practice which will result in tht fastest drying rates consistent with the least depreciation of stock, the least amount of required yard space, and the least handling costs. The study will be carried on concurrently on both hardwoods and softwoods. All the important commercial woods of the United States will eventually receive consideration.

If you have a large number of screws to put into any class of wood, remember a machine will put them in five times as fast as a man.

Toronto Veneer Company Ltd.

1100-1104 Queen St. West - TORONTO

(Operating Panels, Limited, Southampton, Ont.)

ANNOUNCEMENT!

Our lumber department has been functioning satisfactorily for the past several months, but in order to better serve our customers we have opened a lumber yard in Toronto, and are yarding about 2,000,000′ of dry, band-sawn Hardwoods, principally Oak, Gum, Poplar, Chestnut, Walnut and Mahogany.

Thus equipped, we can make prompt shipment of mixed carloads of lumber, also lumber and veneers.

Following is a list of stock we have on yard in Toronto and in Transit:

24 cars 1″—2″ Plain White Oak
30 cars 1″—2″ Qtrd. White Oak
2 cars 1″ x 2½—5½″ Qtrd. White Oak
12 cars 7/16″ x 2½—5½″ Qtrd. White Oak
10 cars ⅝″—4″ Plain Red Oak
8 cars 1″—2″ Qtrd. Red Oak
2 cars 1″ Cherry
10 cars ⅝″—4″ Yellow Poplar
4 cars 1″—2″ Chestnut
8 cars ⅝″—5″ Northern White Ash
6 cars 1″—2½″ Hickory
8 cars 1″—3″ Plain and Qtrd. Red Gum
8 cars 1″—3″ Plain and Qtrd. Sap Gum
2 cars 1″ Tenn. Scented Cedar
2 cars ⅜″ and ⅝″ Mexican Cedar
8 cars 1″—2″ Mahogany
8 cars 1″—2″ Black Walnut

We have no lumber bought at peak prices to dispose of, therefore, our prices will be found to be right in line with the present Hardwood market.

Our Specialties: Soft-textured Indiana White Oak, Mahogany and Walnut

Office and Veneer Warehouse:

Australian Woodworker Visits Winnipeg

Touring Canada for the purpose of studying lumbering methods, and especially with a view to inspecting woodworking plants in the West, R. C. Morrison of Morrison & Daniels, lumber dealers and woodworkers of Brisbane, Australia, was recently shown through the plant of the Radford-Wright-Wilson Company in Winnipeg.

As a practical woodworker, Mr. Morrison was greatly impressed with the high-class material turned out by the Radford-Wright Company, and congratulated that firm on the excellence of their products and also upon the general layout, cleanliness and equipment of the factory.

Morrison & Daniels is one of Australia's leading woodworking concerns, being capitalized at $1,250,000. They have extensive timber limits on which they do their own logging and cutting according to their needs. The company, in addition to the lumbering end of the business operates a large woodworking plant, but produces only doors, and these in the one size only, 2-8 x 6-8, turning out 2,000 a week at the present time, but expect to develop their plant in the near future to permit of this output being doubled, and also intend to increase their lumbering operations, with a view to opening up a large export trade with China and the Orient.

Commenting upon the methods adopted in the B. C. mills, Mr. Morrison was greatly struck by the sawing machinery, stating that in this respect Canada is far ahead of Australia, but is a long way behind the Commonwealth in respect to wood working and finishing machinery.

Canadian lumber men do not pay sufficient attention toward eliminating waste, was the opinion of Mr. Morrison. In Australia the woodworking plants sell every pound of shavings coming from the machines and also sell all the waste lumber which is used for firewood. Between these two by-products they manage to add a considerable sum to the profits of the business in the course of a year. All lumber used in Australia is naturally air dried. There is no such thing as a drying kiln in his part of the country. The more favorable climate and the absence of snow rendering artificial drying unnecessary.

Comparison of Lumber Prices

Lewis Thompson & Co., Inc., Philadelphia, Pa., were showing a very attractive line of plain and half round walnut and mahogany veneers in Toronto from August 27th to September 17th. The display included both plain and fancy stock.

J. H. Vaughan, who was in charge of their display, voiced the opinion that the present is the opportune time in which to stock up with veneers and hardwoods. The prices of his own line had been reduced to rock bottom and as a result many values were actually below replacement costs. This policy had been adopted in an endeavor to secure sufficient business to keep their plant operating and their organization intact. As soon as the demand showed any permanent improvement, prices were bound to go higher, for it would be suicidal for a firm to continue disposing of their output at a price below production costs. In this he only voiced the opinion of other hardwood men who are in close touch with market conditions.

A large number of furniture and piano men called and inspected the showing, some of them leaving nice orders. Mr. Vaughan found business better this trip than on any he had made during the past twelve months, and from this he judged that conditions in Canada were showing a slow but steady improvement.

Lacquer for Fumed Oak

It is claimed that an exceptionally attractive fumed finish may be obtained by using lacquer as a first coater instead of white shellac. This applies more particularly when using a stain finish. The use of the lacquer results in a depth of color and clearness which is not found when shellac is used.

WE HAVE A COMPLETE STOCK OF 3 and 5 PLY PANELS IN VARIOUS WOODS AND THICKNESSES FOR QUICK SHIPMENT

Also offer 3/8" 3 ply Fir s-2-s Panels for Drawer Bottoms and Backing.
1/8" Rotary Cut Northern Red Oak
1/8" Rotary Cut Northern White Oak.
1/8" Birch Veneer 6 to 36" wide 60 to 86" long.
Panels also made to your dimensions.

HAY & CO., Limited Woodstock, Ont.

Not Behind Anonymous Campaign

American Walnut Manufacturers' Resent Propoganda Being Carried on in Favor of this Wood—Have Always Conducted Dignified, Legitimate Publicity Work

We have recently had called to our attention certain propaganda, apparently issued from Cincinnati, relative to the use of substitutes in walnut and mahogany furniture.

This propaganda has apparently been issued anonymously, and we are unaware as to the identity of the instigators. The propaganda ostensibly is the individual act of some salesman of walnut and mahogany lumber. It consists of sending out the letter to manufacturers of lumber, presumably those producing walnut and mahogany. The letter encloses a printed slip, which it is suggested be mailed to furniture retailers in whose windows has been seen furniture labeled as walnut or mahogany, but in reality made largely of some substitute wood.

The letter is written on plain paper with nothing to indicate either its origin or the author, and is as follows:

Type of Letter to Manufacturers

I am a lumber salesman selling Walnut and Mahogany on the road and the house I represent is adverse to adopting any new ideas, and because of this fact I am afraid to submit my little plan to them, but have selected a few firms whom I know to be progressive and herewith ask you as one of them to please cooperate.

It is my humble opinion that the substitution now going on of Birch and Gum could be stopped almost entirely in thirty days' time, if we fellows on the road go after them right.

My idea is to have you give some of the enclosed slips to one or two of your discreet salesmen and ask them every time they see Gum or Birch furniture in a store window, that they jot down the storekeeper's name and address and when they get back to the hotel or office they simply mail the said storekeeper one of the enclosed slips, and at the same time it would not be a bad idea to send the names and addresses to the Mahogany and Walnut Associations and the next time the said salesman passes the retailers' stores he should notice if they still have Gum or Birch in their store windows.

You understand no signature shall be put on the slip and the same simply to be mailed in a plain envelope, and as far as sending in the names and addresses of the storekeepers to the Lumber Associations, this is just a suggestion, because I firmly believe, as an old traveling salesman, the retailers will cut out this faking twenty-four hours after they get notice, then we salesmen will send in orders as well as lists of traveling expenses.

My theory is that at least ninety-nine out of a hundred will stop stealing if they find out some one has actually caught on. The idea of a serial number is to make the warning look official, and in the case of duplication the retailer will take it as a second notice. Yours very truly, A HARDWOOD LUMBER SALESMAN.

Reproduction of Circular

"FRIENDLY WARNING"

Furniture made of Gum or Birch spotted in your show window today.

Am sending this word in, and possibly a test purchase will be made to see if your salesmen will represent the furniture as Walnut or Mahogany, instead of imitation.

This notice is sent to give dealers laboring under a wrong impression time to consult their attorneys and correct any misrepresentation if they be guilty.

Notice A No. 882 ADVANE AGENT

Actual samples of the slip entitled "Friendly Warning" are also enclosed. The numbers are consecutive on each different slip, and there seems to be a series of notices designated by various letters of the alphabet.

In view of the fact that this Association has for several years been conducting a dignified, legitimate and responsible publicity campaign in the interests of American Walnut, we wish to have it be definitely known that we are not responsible for this or any other propaganda unless it is issued under our name and carries with it our copyrighted design, "American Walnut."

While we freely admit that there has existed in the furniture industry a situation, perhaps developed largely through war conditions, that is unsatisfactory, in the matter of the use of substitutes in furniture supposed to be of high class cabinet wood, nevertheless it is our firm belief that this is a situation which is righting itself through the efforts of the furniture manufacturers and the furniture retailers. It has been our observation that the furniture industry is anxious to take such action as will give it the entire support of the public and we consider such propaganda as mentioned above extremely illadvised and since walnut is mentioned specifically we wish to take this occasion to announce that we have had nothing whatever to do with it, and furthermore, it has our entire disapproval.

The American public is thoroughly familiar with the superior qualities of American Walnut as a cabinet wood and is using it for furniture and interior trim to a degree as never before known. We are fostering in every way possible the use and respect for this supreme cabinet wood, but we are doing it in a legitimate and regular manner, and all of our advertising will show definitely its origin.

We should appreciate your courtesy in giving this matter the publicity that we believe the situation requires. American Walnut Manufacturers Association, G. N. Lamb, secretary.

Unusual Carving on Exhibition

A wood carving descriptive of the life of Christ on which five monks worked for fifteen years has been placed on exhibition in New York. The carving, valued at $125,000, was brought to the United States by one of the monks who made it in the monastery at Mount Athos, Macedonia.

The composition is 28 inches high and 23 inches wide, and includes several hundred figures in high and low relief. The central picture is "The Last Judgment," reproducing in wood the detail of Michael Angelo's famous painting.

The modern boring machine is now made to bore all the holes in a piece of wood at one operation.

Adverse Conditions Have Not Affected the Quality of Our Lumber or Service

AT ONE POINT in the development of a modern busines its driving force may keep it going brilliantly while conditions are favorable. Later it gains a solidly established state, imparting a degree of momentum sufficient to maintain the forward movement even under the most trying circumstances.

So with the Anderson-Tully Company, pioneer manufacturers of Southern hardwood lumber, veneer and plywood. Great diffculty in operation has in no way impaired our ability to serve you correctly. The Anderson-Tully Company trademark will always be known where the best in goods and service are most appreciated.

News of the Trade

The Young Lumber Co., North Bay, Ont., recently purchased a C.M.C. hardwood flooring machine.

The carriage factory operated by Thomas Young at Millsville, N.S., was completely destroyed by fire. The loss amounts to $50,000.

Marlatt & Armstrong, Limited, Oakville, Ont., leather tanners, recently installed a new C.M.C. moulder and a new C.M.C. matcher.

The contract for the millwork for the Isaac Brock School, Winnipeg, Man., has been awarded to Brown & Rutherford, Winnipeg.

The Langmuir Mfg. Co., Limited, Toronto, manufacturers of trunks, have added a new Whitney planer to their woodworking plant.

Joseph A. Likely, Limited, Rothsay Ave., St. John, N.B., is in the market for a large band resaw capable of handling material as large as 14" square.

The Simpson planing mill and lumber yard, foot of Spadina Ave., Toronto, was recently damaged by fire. The loss amounts to about $8,000. The cause of the fire is unknown.

The Woodstock plant of the Kirsh Mfg. Co. of Sturgis, Mich., was recently put in operation, the product to include curtain rods, rings and articles for use in the draping of windows.

Cushing Bros. Limited, Regina, Sask., have received the contract for the millwork for the new Lakeview School, which is being erected in Regina at a cost of $112,000.

The British Columbia Wood, Wool & Fibre Products Co., Limited, 679 Granville St., Vancouver, B.C., were recently incorporated with a capital of $25,000., to manufacture wood wool under the McMillan patent.

The Montreal Home Builders Co. are being organized with a capital of $400,000. to enter upon the construction of low-priced houses. Their address is 295 St. Catherine St. West, Montreal.

Jacob E. Herr recently passed away at his home in Stratford, Ont., after a brief illness. The late Mr. Herr was in his 66th year and for many years had been foreman in the Kalbfleisch Planing Mill.

The Modern Home Builders, Limited, Windsor, Ont., have purchased the planing mill and sash and door factory formerly operated by George A. Haugh. This business is to be conducted under the name of the Haugh Lumber Co., Limited.

The Western Mfg. Co., Limited, Regina, Sask., have received the contract for the new $100,000. college being erected at Regina by the Campian College. In this connection the school furniture and fixtures will be purchased by Rev. Father Leahy, Campian College, Regina, Sask.

The Montreal Boatbuilders, Limited, Montreal, P.Q., were recently incorporated to construct, repair and deal in boats, barges and pleasure craft of all kinds; capital $100,000. W. S. Johnson and A. R. Hall of Montreal are two of the incorporators.

C. B. Allen of the Allen-Eaton Co., veneer and panel manufacturers, Memphis, Tenn., has been chosen to represent the plywood panel industry on the Hoover Conference Board. This board meets monthly in Washington in the interests of general business. Mr. Allen is first vice-president of the Plywood Manufacturers Association and takes an active interest in the work of this organization.

W. G. Durst, manager of the Chesley Furniture Co., Chesley, Ont., together with John Hauser, foreman of the plant, were in Toronto recently attending the exhibition.

Messrs. Radford-Wright-Wilson Co., Limited, Winnipeg, Man., have received contracts for the millwork for the following buildings:—Mountain Ave. School, Winnipeg, Man.; Medicine Building, University of Manitoba, Winnipeg.

The Sidney Sawmills, Limited, Sidney, B.C., have taken a contract from the DeLaval Cream Separator Co. for a large quantity of silo staves. Most of these silos are being disposed of in the Ontario market, the eastern factory of the DeLaval Cream Separator Co. supplying the necessary iron parts.

In a letter to the "Toronto Globe" H. E. Mihell of the Imperial Varnish & Color Co., Windsor, Ont., denies that paint and varnish manufacturers are maintaining war-time prices for their products. He maintains that the total reductions in the wholesale price of paints and varnishes have amounted to 23½% in the last eight months.

The plant of the Matthews Sash & Door Co., Fort William, Ont., was recently damaged by fire. While the loss is considerable and covered by insurance, the operation of the plant was only interfered with for being erected in Winnipeg by Gunnell & Higgins at a cost of $65,000., has been awarded to the Dowse Sash & Door Factory, St. Boniface, Man.

Robert Stewart, Limited, Guelph, Ont., are inviting tenders for the construction of a new woodworking factory at a cost of $40,000. This is to replace the plant recently destroyed by fire. The new building is to be two storeys, 100 x 175, and of mill and brick construction. It is understood that all the machinery for this new factory has been purchased.

Shaw & Son, Collingwood, Ont., contemplate establishing a woodworking plant in that town. An agreement has been entered into with the town council whereby certain lands were deeded outright to the above firm and others were leased. A fixed assessment of $1,000. a year has been granted for a period of five years.

Wilders, Limited, Montreal, P.Q., have been incorporated to manufacture and deal in household furniture of all kinds and to conduct a general merchandising business; capital $500,000. H. K. Hemming and J. A. Black, public accountants of Montreal, are two of the incorporators.

The Arcadian Phonograph Co., Limited, Toronto, has been incorporated to manufacture and deal in phonographs and musical instruments. Capital $40,000. J. H. Young and L. J. Brown of Toronto, are two of the incorporators.

J. A. Pyke, a well-known Montreal designer and builder of motor boats, was instantly killed when a motor boat belonging to G. B. Clark of the A. R. Clark Co., Toronto. The accident occurred following a race in front of the Exhibition Grounds when the boats were banking in an effort to reduce their speed.

Chas. A. Brockbank of the Concord Piano & Player Piano Co., 81 King William St., Melbourne, Australia, was in Toronto recently purchasing equipment and supplies for his firm. He placed orders with some of the local piano action manufacturers for a number of actions, and some of the Canadian machinery firms

A Minute a Day——

It isn't much, but if considered in the light of waste is a mighty important factor in every business. Let's figure it out and see what it amounts to in a year.

If one employee is a minute late each day—either morning or noon—he loses six minutes a week, or three hundred and twelve minutes a year, or 5 1/5 hours. The average workman will perhaps earn 75c an hour. You therefore pay $3.90 for which you do not receive the labour you have purchased. On this basis, with fifty employees, it will amount to $195.00, and with a hundred employees, $390.00 a year.

We have taken the minimum of lost time, but it is conceded that with unprotected pay-rolls the average loss is five minutes per man per day.

Is it not worth a few moments' time to drop us a letter requesting further particulars about the INTERNATIONAL TIME RECORDERS—the accurate, legible, and unchangeable watchman of your pay-roll? Which are used by

THOUSANDS of Canada's most successful firms—why? Above is the answer.

International Business Machines
SPEED ACCURACY ECONOMY

International Business Machines Co.
LIMITED

F. E. MUTTON, Vice-President and General Manager

Head Office and Factory: 300-350 Campbell Avenue, Toronto

HALIFAX, 44 Granville St. ST. JOHN, 29 Dock St. QUEBEC, 506 Merger Bldg. MONTREAL, 1 and 3 Notre Dame St. OTTAWA, 190 Queen St. TORONTO, 409½ Yonge St. HAMILTON, Room 8, 36 James St. S. LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd WINNIPEG, 227 McDermott Ave. VANCOUVER, 230 Cambie St. SASKATOON, 254 Third Ave. S.

Also manufacturers of International Dayton Scales and International Electric Tabulators

were favored with orders for equipment. Mr. Brockbank stated that he had no idea that such high-class woodworking equipment was being manufactured in Canada. His only regret was that he had not visited this country first, as in coming through the United States, he lpaced orders there for a considerable volumd of equipment.

John J. Knight was suffocated recently in the shavings vault of a Hamilton planing mill. Mr. Knight evidently climbed in the bin to loosen the shavings when he was buried and could not extricate himself.

The Gove Motor Car Co. recently broke ground for their new plant, which is being erected at Thorold, Ont. A car known as "Falcon Light Six" will be produced.

The Valley City Seating Co., Limited. Dundas, Ont., recently exported a large consignment of church furniture to Hendrina, Transvaal, South Africa. This order included pews and other items in church furniture.

A catalogue has been received from the Luster-Jordan Co., Inc., Norristown, Pa., covering their line of lock-corner wood box machinery. This includes equipment for cutting the lock corners, gluing, assembling, squeezing and trimming the corners. Many of these machines are automatic.

Reitzel's Limited, Waterloo, Ont., were recently incorporated to manufacture and deal in furniture of all kinds and to take over as a going concern the furniture manufacturing business formerly conducted by Reitzel Bros. Capital $125,000.

W. H. Shaw, Toronto, who has contributed many articles for the columns of the "Canadian Wood worker and Furniture Manufacturer," was in charge of the woodworking exhibt made by the Buyer's Door & Manufacturing Co., Limited, Toronto, formerly Batts, Ltd.

The Cincinnati office of Mowbray-Robinson Co.. hardwood lumber manufacturers, was recently destroyed by fire. The loss, which amounts to $5,000., is covered by insurance. The blaze was confined entirely to the office building, none of the lumber in the yard being touched.

S. Lower, Quebec, recently passed away at his home after a brief illness. The late Mr. Lower had conducted an upholstering establishment in Quebec for the last half century and was honored and respected by all who came in contact with him. He was in his seventieth year.

The hardwood lumber mill and stock of hardwoods belonging to George Mason & Co., Midland, Ont., was recently destroyed by fire. More than 600,000 feet of hardwood and several hundred thousand hardwood broom handles went up in flame. It is probable that the Mason Company will rebuild their plant. In the meantime seventy men are thrown out of work.

The Parker Motor Car Co. of Montreal, capitalized at $10,000,000., have completed arrangements with Caron Bros. whereby they will secure sufficient space in the Longue Point Works to provide for assembly, on a large scale, of the company's new car, known as the "Royal Six." Production will likely be in the neighborhood of 4,000 cars per year.

John M. Kilbourn, one of the pioneer industrial leaders of western Ontario, recently passed away at his home in Owen Sound, Ont. He was connected with numerous well known manufacturing organizations, among which might be mentioned the North American Furniture Co., Limited, and the National Table Co., Limited, both of Owen Sound. Mr. Kilbourn was born at Smith's Falls in 1848 and moved to Owen Sound in the early sixties. His sterling qualities won the esteem and respect of a wide circle of friends and business associates.

The Rice Lake Canoe Co., Limited, Cobourg, Ont. which is affiliated with Langslow, Limited, furniture manufacturers, have decided to enlarge their canoe factory. A new addition 155' x 55', two storeys high is contemplated. In all probability sufficient equipment will be installed to make this plant independent of the furniture factory. At the present time practically all the millwork on canoe stock is done in the latter plant

The Boake Mfg. Co. Limited, are making a few changes and improvements in their plant. They are installing two new boilers, an American No. 77 fast feed matcher, two American No. 26 moulders and a Preston power feed rip saw. Some time ago they equipped their transmission line with Chapman double ball bearings. When the new installations are complete they will be able to take care of an increased volume of business.

W. C. Durant, founder of the General Motors, Limited, of U.S. and Canada, recently completed a deal whereby he secured the Leaside Munitions plant. He will use this for producing the Durant car which is just being placed on the market. Plans call for a capacity of 100 finished cars a day. In this connection a complete woodworking plant for the manufacture of automobile bodies will be installed. At the present time the Durant car is being manufactured at Flint Mich., and it is anticipated that the Canadian plant will be producing by March 1st.

The Canadian Gary Motor Truck Co., Limited, were recently incorporated with a capital of $250,000. to manufacture and deal in automobiles, motor trucks and vehicles of all kinds. This firm has purchased the buildings of the Chase Tractor Co., Limited, situated at 28 Atlantic Ave., Toronto, and will recognize this plant for the production of their line of motor vehicles. This is the Canadian branch of the American Gary Co.. Gary, Ind., of which Frank Dawson is president and Theodore Zumstein is vice-president and sales manager.

The Frank A. Conkling Co., Memphis, Tenn., dealers in Southern hardwoods, have completed arrangements whereby they handle the sales of Alexander Bros., Belzoni, Miss. This latter firm operate mills at Junks, La., Belzoni, Miss., and Memphis, Tenn., and cut nothing but Southern hardwoods specializing in soft-textured red gum, plain and quarter sawn, cypress, oak, ash and elm. The production of these mills, together with the output of the Conkling mills at Percy and Issaquena, Miss., give the Frank A. Conkling Co. a daily production of 160,000 feet, enabling them to increase the efficiency of their service to the consuming trade.

George H. Brown, who is connected with the Knechtel Furniture Co., Limited, Hanover, Ont., was the winner of the wood-guessing contest recently conducted by J. A. Fay & Egan Co. of Cincinnati, Ohio. This firm published untouched photographs of a number of samples of wood and offered a prize for the person who could come nearest naming all the kinds of wood shown.. Mr. Brown was able to name four correctly, and out of all who tried, he was the only one who was able to submit this number of correct replies. The woods shown were as follows:—white cedar, red cedar, Queensland kauri pine, crow's ash, silky oak, blue gum, iron bark and tallow wood.

In the August "Canadian Woodworker" we reported that the furniture factories at Stratford had resumed operations on a comprehensive scale. Now

One Reasan why Kraetzer Cured Gum is Straight and Flat

Kraetzer-Cured Gum

THE ONLY KIND THAT IS ALWAYS BRIGHT, STRAIGHT AND FLAT

Kraetzer-Cured Gum does not "work" after being made up into furniture. It does not warp or open at the joints, or check in panels in the way that other less scientifically handled lumber does.

If you have used Kraetzer-Cured Gum, you know this already. If not, you owe it to yourself to find out about this super hardwood.

This "quality product" does not happen by chance. One reason is that Kraetzer-Cured Gum is steamed in the Kraetzer Preparator. Then every board is carefully graded, the sticking is scientifically and perfectly done, every stack is side ventilated, is elevated, and every pile is on wheels. Then, to begin with, remember that Kraetzer-Cured lumber is made from large virgin timber of exceptional quality.

Besides Gum, we have Oak, Ash, Tupelo, and Cypress of a quality that is unsurpassed.

Write us today for the reasons why Kraetzer-Cured lumber is *different* and *better*. We guarantee every board.

The Kraetzer-Cured Lumber Co.

GENERAL OFFICE: GREENWOOD, MISS.

Band Mills: Greenwood, Miss., Moorhead, Miss.

comes the report that the large Woodstock plant of the Canada Furniture Manufacturers, Limited, has resumed production. The Beach Furniture Co., Limited, Cornwall, Ont., have adopted a full-time schedule, calling for 55 hours a week, 10 hours per day for 5 days and 5 hours Saturday. The management of the latter company report that the prospects for fall business are very bright. This firm recently opened warehouses in Western Canada and in the United States.

The plant of the Preston Car & Coach Co., Preston, Ont., has been taken over by the Canadian Brill Co. It is the intention of the new concern to make this plant the largest car works in Canada. The Canadian Brill Co. have many orders booked, one of which is for $400,000. and must be completed by January 1st, 1922. This means that the output of the plant must be increased and the staff enlarged. It is expected that about 400 men will be at work by the 1st of October and by the first of the year this number will have been increased to 600.

Among the pianos on display in the booth of Heintzman & Co., Limited, at the Canadian National Exhibition is to be found the $3,000. piano which has been constructed to the order of Tetrazzini, the well-known operatic singer for her own use in her castle in Rome. This piano is in florentine design with carved legs and is finished in ivory white, the mouldings being tipped and finished in gold. It has taken nearly a year to complete this instrument. The fact that, after using pianos made by practically all the well-known manufacturers, Tetrazzini should place an order with a Canadian piano maker, is an unmistakable compliment to the quality of the product of Canadian plants and to Heintzman & Co. in particular.

George Dobson, Vancouver, B.C., western representative for the McLagan Furniture Co., the Stratford Chair Co. and other Stratford firms, was killed recently in an auto accident just outside Kelowna, B.C. It appears that a party consisting of the deceased, Harry J. Godfrey of Vancouver, salesman for Simmons, Limited, Hugh McLaren, manager of the B. C. branch of Simmons, Limited, together with Mr. McLaren's young son, Hugh H. McLaren, aged 7, were on a business trip and while motoring between Kelowna and Summerland, the car became unmanageable when crossing a bridge, and breaking through the light railing, crashed to the bed of the creek some 70 feet below. The driver, George Dobson, was instantly killed and Mr. McLaren's son fatally injured, dying some hours later, while Mr. McLaren and Mr. Godfrey received rather serious injuries. It is thought that the accident was due to the steering gear of the car breaking.

Mistakes in Building Church Organs

Each year hundreds of churches are installing new organs. Some of them are musically disappointing, while others, being poorly constructed, soon require repairs more or less extensive and are a continual source of expense and annoyance because of mechanical derangements. A first-class organ should be a continual satisfaction from the day of its installation, and, under ordinary conditions, should not require any repairs except minor adjustments and periodical tuning for at least ten years. Where organs are not satisfactory, the trouble is not always because unscrupulous builders have been selected and allowed to follow their own desires; frequently the ignorant organ-purchasing committee, or organist, are responsible for a dubious scheme which a conscientious builder should refuse to accept.

Do Your Mouldings Match?

The above heading was taken from an advertisement in a large woodworking and lumbering paper. The advertisement went to ask,—Do all the mouldings of the same catalogue number in your stock match exactly for size and shape, or do they make a very poor butt joint? Stocks bought at different times from different times from different mills, and sometimes from the same ill, often show a wide variation in size and contour. This is the result of regrinding moulder knives without preserving their exact shape. Keeping up these cutters is a job for an expert. Errors in profile will grow, almost unnoticeably, with each grinding until the size and shape of the moulding is entirely changed. Our line of mouldings and matched items is manufactured to a standard. Mouldings, sidings and flooring run true to shape and dimension. This is one of the final points of lumber merchandising that counts for so much nowadays.

Does this not point out the weakness of present methods under which mouldings are run to a variety of sizes and designs, and is it not in line with the idea of adopting standards for millwork of all kinds as advocated in recent issues of the "Canadian Woodworker and Furniture Manufacturer?"

$30,000,000 in a Chair

In the Shah's palace at Teheran may be seen the celebrated Peacock Throne, valued at more than $30,000,000. It was taken from the Grand Mogul at Delhi by the victorious Nadir Shah. It is in many ways a curious and wonderful article, virtually a single chair, upon which the Shah sits when he holds diplomatic receptions.

The wood is of the finest evony, and most elaborately carved, and ornamented with sheets of gold on which are enamels, fantastic birds, and chimeras set with precious stones, culminating in a diamond sun.

Pipe Makers Using Birch

Canadian birch since the war has acquired a South American name. Nowadays it is fashioned into pipes and then called something besides birch. The only evident reason for the change seems to be the fact that the process that converts the soft birch into a hard pipe was originated in a Latin-American country, according to the New York Evening Sun.

Birchwood owes its new name and its present prominence in the pipe industry to the war, which cut off the supply of briar and sent the prices of stocks in America sky high.

Substitutes have been sought for the expensive imported briar. The cessation of importations with the war—they haven't resumed yet—intensifies the search for an American wood that would provide a suitable substitute.

Many native hardwoods were tried without success. Most of them weer either too hard to be worked into pipes, or too heavy to rest comfortably between a smoker's lips. Then some one hit upon the expedient of trying a softer wood and employing a process that would give it the required hardness for use in pipe manufacturing. Birch was found the most suitable for the purpose.

Machine manufacturers are now making sanders for all kinds of work. It is difficult to find the job which cannot be sanded by machinery.

Wanted

Two No. 9 Nailing Machines, Morgan preferred. Apply Salada Tea Co., 461 West King St., Toronto. Phone Adelaide 4930. 9

Skid Construction Machinery on Track

In assembling the plant for constructing the Hetch-Hetchy Dam for San Francisco it was occasionally necessary to move motors weighing several hundred pounds from one part of the job to another. Particularly on short hauls, it hardly seemed worth while to raise the motors to flat car level and then lower them to track level again. A means adopted to avoid this consisted of putting a motor on a pair of skids and moving it as a sled to a position on the industrial track with the skids at right angles to the rails, and then dragging it along the rails by means of a chain to the contractor's dinkey. Care was taken to see that the end of the skids which projected over the rails would clear any obstructions that might be met with along the track.

BARGAINS

We warrant the following used and rebuilt Wood Working Machines.

1 Woods 15 X 6″ Planer & Matcher.

1 MacGregor 26 X 8″ Double Surfacer.

1 Yates 30 X 6″ Double Surfacer (rebuilt)

1 Smith 8″ Sticker.

WITH ALL THY GETTING, GET UNDERSTANDING

By C. B. HARMAN, Secretary Southern Sash, Door and Millwork Manufacturers' Association.

We had a personal letter April 29th from B. C. Forbes, the magazine writer, and at the top of his letterhead we found the above staring us in the face. Mr. Forbes, in making reply to a communication from our office, with these six little simple words has given us a thought which we are now passing on to the millwork fraternity with the sincere hope that these same six words will burn themselves into the memory of every one.

Refer to the title and read again, "With All Thy Getting, Get Understanding"—no more was ever said with as few words, nothing whatsoever is needed by the business man (the manufacturer especially) as "understanding."

We find in Webster's dictionary, "Understanding" defined as follows: "Knowledge, perception, agreement, explanation, belief, sense, reason."

A business man of understanding, of knowledge, belief, sense and reason is equipped "to the teeth" with the best weapon on earth. He knows when and where to start and exactly when and where to stop.

The business man of understanding must of necessity have a knowledge of the cost of that which he must price at a profit. He believes that his cost is correct, has sense enough to let the other fellow take an order when below his cost or when it does not afford him a fair profit and has sufficient reason to see that it is the correct and best thing to do.

The business man without understanding, of a consequence has no knowledge of his cost, has no knowledge that he does not know his cost, but believes that he does. He also believes that his competitors are after his goat and believing that his business is so different than any other, he is without sufficient sense and reason to let up on an order when the figures begin swimming and floating about near and around the "sucker hole."

Now, then, just after reading Mr. Forbes' letter, along comes another, which "sot" us to thinking, and we have been thinking ever since. It read something like this:

"————————, N. C., April 22, 1921.

"We were requested a few days ago to make a price on a lot of window and door frames with inside trim and were awarded the order at $870.00. Others figures submitted were: Factory No. 2, $895.00; factory No. 3, $920.00.

"We booked the order and were preparing to bill it into the factory when we got a letter from the customer cancelling the order, stating that another factory, No. 4, had agreed to furnish the same material for $475.00, or about 45½ per cent. less than our price of $870.00, which was only $25.00 less than the next lowest bid and $50.00 lower than the highest bid."

We are still thinking—the uppermost thought being, How can the first three factories have the nerve to charge such outlandish prices? We are also wondering just how much factory No. 4 will really make on the transaction.

And finally the biggest thought of all is in a fact, and that is, neither of these four factories have any well defined system of cost keeping, all four bids were purely guesses or approximations.

"With all thy getting, get understanding."

Information and Inquiries

You are cordially invited to make use of this department

Disposal of Wood Waste

Weedon, P.Q.,
July 27th, 1921.

Editor, Canadian Woodworker,

I noticed in a recent issue of the "Canadian Woodworker and Furniture Manufacturer" that there is a market for sawdust shavings and other forms of wood waste. We find that in the manufacture of dowels and rods that a considerable quantity of this material accumulates. Could you offer any suggestions that might aid us in finding a profitable market for this waste.

Yours truly,
Marcel Despres.

In nearly every case the market for such material must be worked up locally. In almost every village or town there is a certain demand for shavings and sawdust, either for bedding, packing purposes as a floor covering for butcher shops or for filling wall spaces in houses and other buildings. It is just by going after such small openings as these that a permanent market can be developed. Wood waste in the form of edgings and trimmer blocks should find a real sale as a fuel.

There are many small articles, particularly in the toy line, which could be made from small pieces of wood, but unless the market for such a product is large enough to warrant a large production and special equipment, it is doubtful if wood waste could be worked up at a profit.

If you have a baling press you may be able to find a market for a certain amount of shavings at a distance. We know of several instances where local planing mill operators haev shipped carloads of baled shavings across the line. The price is small, being in the vicinity of 25c to 30c a bale, but at that, it more than pays handling expenses.

Staple Driving Machine

Saskatoon, Sask.,
August 24th, 1921.

Editor, Canadian Woodworker,

Can you advise me if there is any machine on the market for driving staples in wood slats, which are attached to the canvas on binders? What we had in mind was an electrically-operated machine. Any information along this line will be appreciated

Sincerely yours,
L. W. Ross.

We do not know of any machine made specially for this purpose. If any of our readers can enlighten us on this subject, their co-operation will be appreciated.

Desirous of Handling Canadian Furniture

A large Jamaica house is desirous of getting in touch with Canadian manufacturers of wicker baby carriages, refrigerators, wicker parlor furniture, iron bedsteads, bedroom, parlor and dining room furniture and general house furnishings. Catalogues and price lists are invited. Enquiry 3053.

Mouldings and Carvings

Joliette, P.Q.,
August 3rd, 1921.

Editor, Canadian Woodworker,

Will you tell me where I can secure composition moulding and carvings suitable for furniture: also hardwood dowels, both plain and spiral grooved.

Sincerely yours,
R. T. Brazeau.

Composition carvings and mouldings suitable for use on furniture may be secured from the Decorators' Supply Co., Archer, Leo and Lime Sts., Chicago; the Waddell Mfg. Co., Coldbrook & Taylor N.W., Grand Rapids, Mich., or J. Walter & Sons, Kitchener, Ont.

There are a large number of Canadian firms manufacturing dowels. Would suggest that you try either the Canada Wood Specialty Co., Orillia, Ont., or J. R. Eaton & Son, Orillia.

Demand for Three-ply

A firm in Port Elizabeth is in the market for a quantity of three-ply material, and would like prices and delivery dates from Canadian manufacturers. Enquiry 3381.

Boxes and Box Shooks Wanted

A dealer in the Dutch West Indies is desirous of securing quotations on boxes and box shooks from Canadian box manufacturers. Enquiry No. 3356.

Progressive vs. Compartment Kilns

All dry kilns now on the market are either progressive or compartment kilns. In the progressive type the drying conditions increase in severity from one end of the kiln to the other, the material being moved into severer conditions as it dries. In the compartment type the same temperature and humidity prevail throughout the kiln at any one time, beginning with mild conditions and increasing in severity as the material becomes dry.

The kiln-drying data and experience of the Forest Products Laboratory indicate that each type has particular advantages on certain points, as follows:

The progressive type of kiln requires less skill in the operator. It consumes less heat per pound of water evaporated from the wood, but the saving of steam possible should not be considered so important as the question of ability to perform the work required with the best results. The progressive kiln reaches its greatest heat efficiency in drying from the green state, and is most useful in circumstances which permit of its being supplied continuously with green lumber of one thickness and class. It is, however, impracticable with this type of kiln to give individual attention to special loads of lumber.

The compartment type of kiln is more flexible and affords greater control over thed rying conditions, permitting less change in temperature, humidity, and circulation in the kiln with variations in the wind and weather. It is better adapted to meet the varying requirements of different kinds of material and is most useful where exact and careful drying is required, as in the handling of refractory woods.

The Lumber Market

Domestic Woods

The opinion seems to be general among a large number of wholesale lumber merchants that prices have about touched bottom and that the last will shortly be seen of receding quotations. Of course all do not share in this opinion but the preponderance of belief is that base figures have now been reached in all woods with one or two exceptions. In the larger cities general building has also taken somewhat of a spurt, and there is a better feeling prevailing among retailers, many of whom are busy in their woodworking plants.

The air of speculation is slowly disappearing from the lumber arena, and there is not as much bartering and dilly-dallying about prices as there has been during the past few months. Many firms are adopting a finality in regard to quotations and are prepared to stand or fall at the figures named. Most of the large firms have taken a heavy loss and now feel that they are down to bed-rock. Those concerns who are financially able to hold their stock are not parting with it by any means unless they obtain what they consider a fair value. Prices are, certainly, considerably firmer in all lines of lumber than they were a few weeks ago and there is a steadying influence in hemlock and spruce. The feeling on the whole is more buoyant than it has been at any time during the summer, and while no one expects a record business this fall, still the turnover is going to be larger than many have been looking for.

In hardwoods there are many more inquiries, and when salesmen call upon large consumers they are given a hearing and asked the prices on different lines, whereas not so long ago many manufacturers absolutely declined to listen to such a thing as price, and were not interested at all in the situation, being stocked to the limit.

While buying is still carried on meagrely, it is felt that the tide is beginning to turn. There are signs of the resumption of industrial activity in many lines and the automobile business is pretty active at the present time. A number of motor firms are making inquiries for thick birch and ash No. 1 common and better, and in some of the upper grades of hardwood there is a limited quantity of the thicker stuff.

Prees are yet a long way from being stabilized, but except in the case of those who are compelled through financial or other reasons to dispose of their stock, there is no general weakening below the levels of valuation that have been current for some time.

Imported Woods

There does not appear to be any material change in the hardwood lumber situation. True, there is a better undertone in the various producing centres and many operators believe that the turn has been made. There seems to be a slight increase in the number of inquiries coming in although buying remains at about the same level. The furniture and other woodworking industries continue to buy in a hand-to-mouth fashion, this in spite of the fact that a shortage of many items, particularly upper grades, is bound to occur.

While the quantity of high-grade stock on hand is sufficiently low to cause a stiffening of values, yet certain manufacturers continue to sacrifice their better stock in an effort to raise sufficient funds to enable them to hold the vast quantity of low-grade material which has been accumulating at practically every mill. No attempt has been made to resume cutting or logging operations, so that stocks are slowly but surely being reduced.

According to a Memphis, Tenn., report, many operators anticipate an improvement in demand during the fall months. Exporters are taking more interest in southern lumber and a fair volume of stock is being sent overseas. Foreign inquiries are being received with gratifying regularity, and even though the price is not all that is desired, this movement is regarded as a very favorable development. Flooring manufacturers continue active and are in the market from time to time. Plain white oak is one of the strongest items in the field and many are suggesting that the price of No. 1 common, plain white oak will stabilize at abont $50.00.

According to an Evansville report, there have been some improvements in the situation. It would not be correct to say that there has been a rush for stock but there certainly is an improvement in demand.

The situation may be summed up by saying that while a shortage of certain grades and certain stock seems to be inevitable and may be accompanied by a stiffening of prices, there is no marked increase in demand nor do prices appear to be any firmer, and the hand-to-mouth policy adopted some time ago by many of the wood-using industries is still very popular.

To Stock and Handle Hardwoods

For the past few months the Toronto Veneer Co., Limited, Toronto, Ont., have been taking orders for hardwood lumber of different kinds. In order to perfect and improve this service, they are establishing a lumber yard in Toronto at which they expect to yard about 2,000,000 feet of dry band-sawn hardwoods, principally oak, gum, popular, walnut and mahogany. Carrying such a large amount of material in stock, will enable them to make prompt shipments of mixed carloads, and they will also be in a position to include veneers and plywood if desired. It is the intention of the Toronto Veneer Co. to sepcialize in soft textured Indiana white oak, together with mahogany and walnut. The yard is situated at Atlantic Ave. and the G.T.R. tracks.

Canadian Birch for Tea Chests

The Canadian birch is now used to a considerable extent in the manufacture of tea-chests for trade from the Orient, according to Mr. C. Stuart Brown, of the Acme Tea-Chest Company, who recently landed.

Tea chests are made from three-ply veneer, stated Mr. Brown, birch being used almost exclusively on account of its strength, combined with the lightness and preservative qualities. Some of the wood used in tea-chests can now be brought from Finland.

This manufacturer is making his first trip through Canada. He is going to Ceylon, Colombo and other great Oriental centres of the tea-growing industry. He formerly has been making these excursions through the Suez canal, but taking the Canadian route for the first time, states that he now realizes all that he has previously missed.

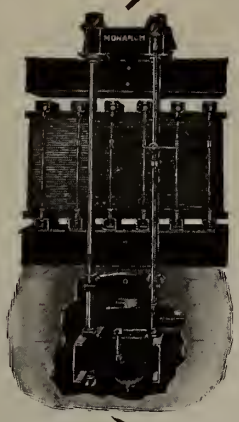
Farquhar Hydraulic Machinery



Monarch Veneer Presses

Farquhar Hydraulic Veneer Presses have double steel head and base, and heavy steel strain rods. Cylinder, which is of steel with detachable saddle, can be repacked without removing the ram. Pump is quick acting, of rigid construction. A pressure of 100-lbs. to the square inch is applied to the veneering surface. Stock is handled by retainer system, unsurpassed both for efficiency and economy.

These presses are built to suit all requirements, liberal proportions with first quality material and workmanship throughout.

We make a specialty of Pumps, Accumulators, Etc. Also all kinds of special Hydraulic Presses and equipment to order. Write us concerning your requirements.

GALT, ONTARIO

A KILN is as GOOD as its PROCESS—
plus its EQUIPMENT—
plus the SERVICE of the MAKER—
plus the ORGANIZATION back of it all—

OUR PROCESS assures the control of the three fundamental factors—HEAT—HUMIDITY—CIRCULATION.

OUR EQUIPMENT is guaranteed complete, sturdy in construction, simple in its installation, economical to maintain.

OUR SERVICE is the broadest—engineers for layouts, building designs and operation—superintendents for erection and installation—experienced woodworkers for consultation and service during the life of your kiln.

OUR ORGANIZATION has been composed of woodworkers for thirty-five years, men who know wood and have handled it through the complete range of manufacturing operations.

Cary's SUPERIOR QUALITY Corrugated Fasteners

SAW EDGE

PLAIN EDGE

According to final decision, after long litigation, we have been granted the SOLE RIGHT to manufacture a Saw Tooth Corrugated Fastener with a continuous cutting edge. Our fastener is beveled evenly on both sides, which enables fasteners to be driven in straight, and much easier than any other fastener made. Our Corrugated Fastener is made in various widths and corrugations, also in coils wound right and left. Try our products and you will use no other.

Samples and prices on request.

CARY MFG. CO., Brooklyn, N.Y.

CARBORUNDUM BRAND GARNET PRODUCTS

MAKE GOOD SANDERS BETTER SANDERS

Carborundum Brand Garnet Belts are accurately made—the joints are strong and flexible

Carborundum Brand Garnet Paper increase the output of the single drum sander.

TAKE Carborundum Brand Garnet Paper and Cloth on any sanding operation from the coarsest work on the disc or the drum sander to the finest hand finishing.

You will find that they cut clean, fast and uniform—that there is flexibility where it's needed—that every inch is evenly coated with the purest, sharpest of North River Garnet Grain.

There isn't a bit of grain, backing or glue that goes into the making but what has absolutely met the high manufacturing standards set by Carborundum ideals of quality.

THOUSANDS ARE LOST

In Oiling and Re-babbiting Bearings, and Overhauling Transmissions

For the same reasons — inefficient bearings—thousands more are lost

—in slow speed and low production

—in imperfect and poorly finished products

—in variations in products making finishing by hand necessary.

SKF engineers will show you how they have helped manufacturing throughout the world to avoid these losses. They bring to you without charge experience gained in industrial plants of every kind. They offer you in addition, the services of the **SKF** Industrial Laboratory—to solve any new problem that may arise in your plant.

Consult **SKF** engineers without incurring either expense or obligation.

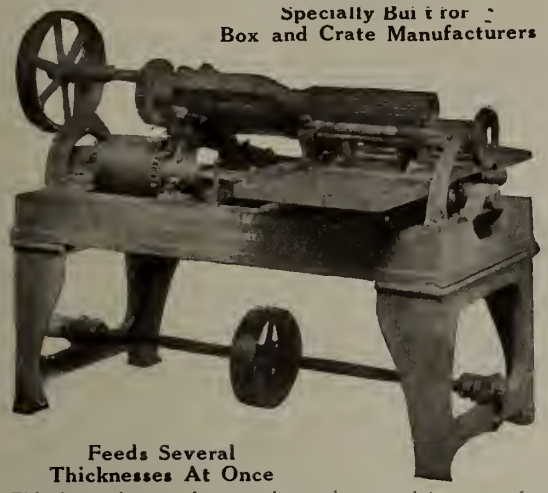
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

Chattanooga Machinery Company
Chattanooga, Tenn.

We Manufacture a complete line of

Chair, Cane-Cutting and Bending Machines

CUTS AND CATALOG UPON REQUEST

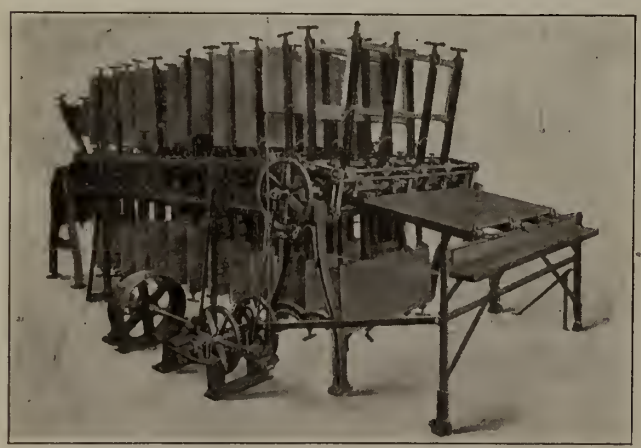
One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier



For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

SIMONDS
SAWS and KNIVES

Are made right. Every operation from the making of the steel to the finishing and packing is watched by experienced workmen. The latest appliances known to the metal trades are used to insure the quality of SIMONDS Saws and Knives. After each operation they are inspected by experts for defects in quality and workmanship. The result—as good a saw as human skill and science can make. Prove it to your own satisfaction. Let us quote you on the tools you need.

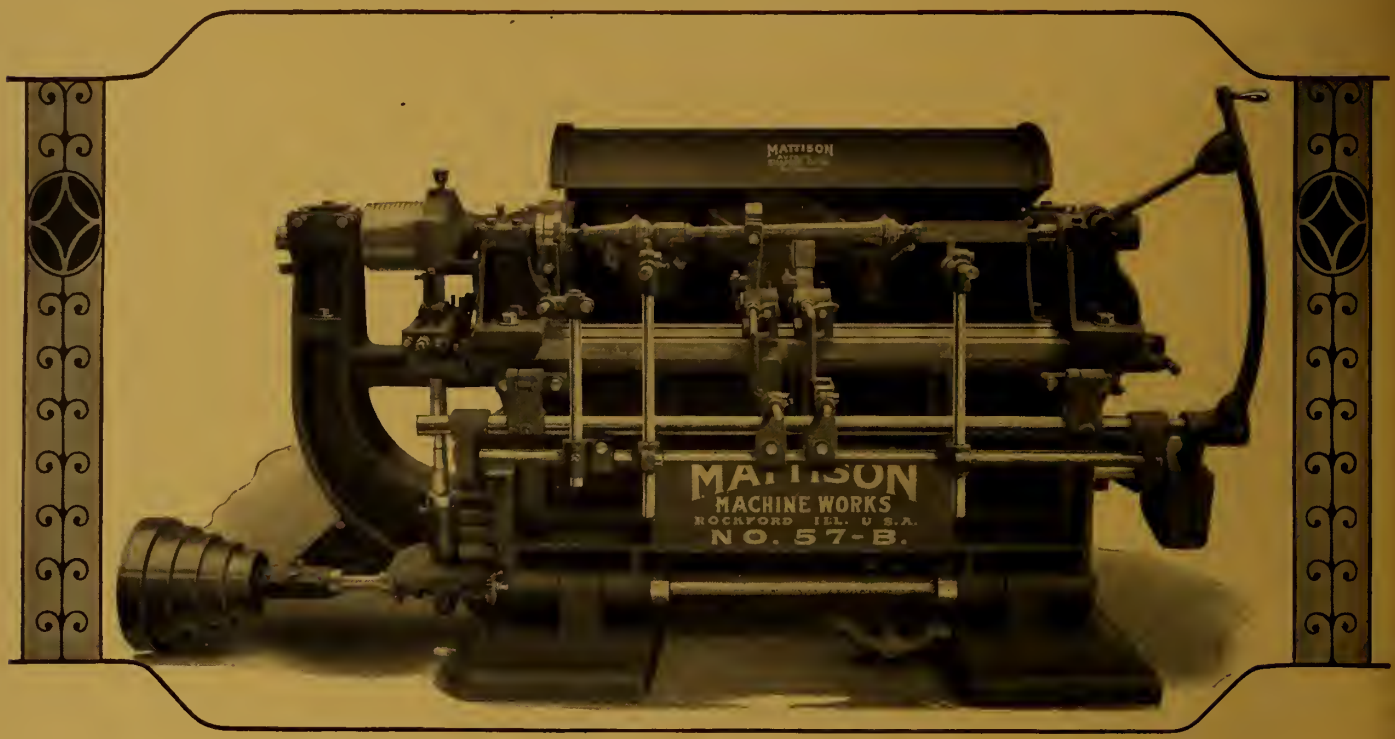
MATTISON
Automatic
The Standard Shaping Lathe
OVER 3000 IN USE



New Styles Demand More Turnings

The Mattison Automatic Shaping Lathe produces turnings much faster and cheaper than is possible with hand methods or with old style machine equipment. But of even greater importance is its flexibility which gives your designer free play in creating his designs. It faithfully reproduces all the historic round, square and octagon turned work, which plays so important a part in the new, distinctive patterns of today

If it is worth while to bring out new patterns, isn't it just as important to give equal consideration to the best and most economical method of producing those patterns?

MATTISON

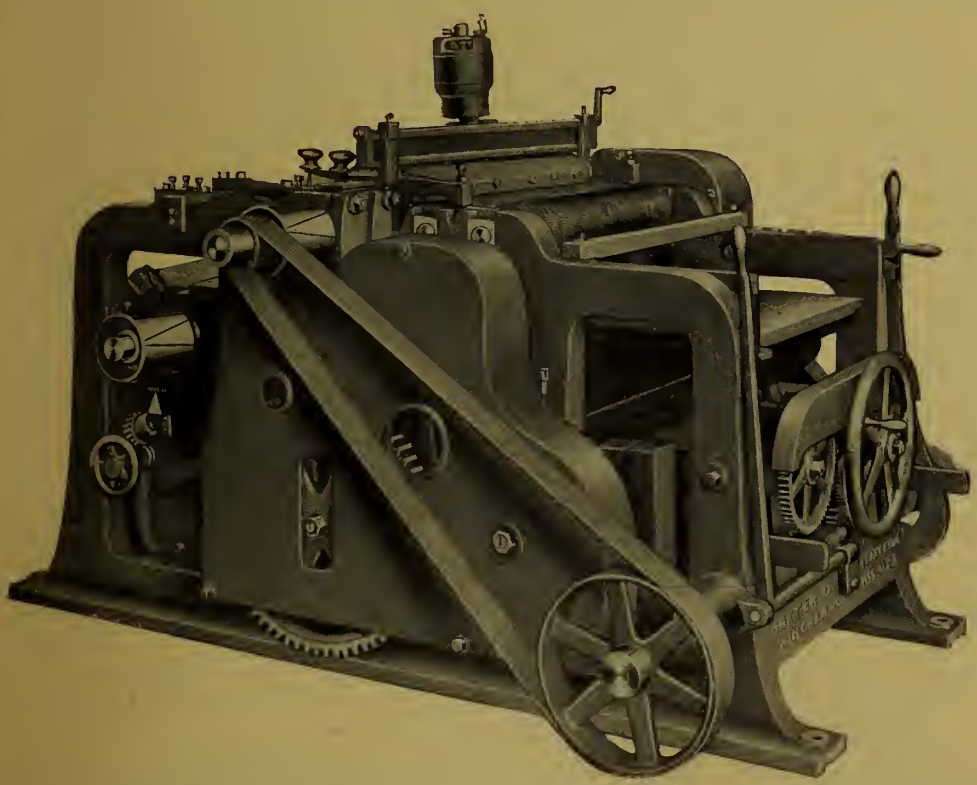
CANADIAN WOODWORKER and Furniture Manufacturer

THE WHITNEY
No. 24 DOUBLE PLANER

is built to do the smooth and accurate planing required in Furniture, Desk, Chair and Cabinet Factories as well as Planing Mills and box Factories.



These machines can be furnished with two or four-knife Square Cutter heads or four-knife Round Cutter Heads, Flexible or Sectional Chipbreaker and Motor-Driven Grinders and Devices.

Special Features

A Rigid Frame.
Bed raised and lowered on inclines.
Power hoist for bed.
Hardened Tables opposite cutter heads.
Automatic Chipbreaker.
Eight gear-driven feed rolls.
Two sectional infeed rolls.
Positive and powerful feed.
Clamp cutter head boxes.
Cutter heads with long bearings and large diameters.
Cutter heads belted at both ends.
Machine cut gears.
Lower head easily and quickly removed.

Winchendon, Mass. *Can. Selling Representative—H. W. Petrie, Ltd., Toronto, Ont.*

CONDIT

No Power Circuit Should be Broken with a Knife Switch

Condit Type N-2 Oil Switch

Condit Type 1 Oil Starter

By using Condit Oil Starters and small industrial Oil Switches to protect small motors and small power and lighting circuits in woodworking plants, the fire hazard is eliminated and many delays caused by trouble with small motors not properly protected, is avoided. When a circuit is opened, the arc is under oil which immediately extinguishes it. Thus, serious trouble very often caused by knife switch blades burning in ways which prevent proper contact and allowing a three phase motor to operate on single phase, is obviated.

Garlock Walker's New Office

We have moved our office from 32 Front St. West to 163 Dufferin St., thus consolidating office and warehouse. We will be pleased to see an old and new customer at our new address. Take King West car to Dufferin St. and walk two blocks south towards Exhibition grounds.

If you need additional machine equipment or are interested in the latest improved machines, write us.

A few machines offered from stock are listed below :

1—McGregor-Gourlay Double Arbor Universal Saw Table, same as C.M.C. No. 618, with 14" saws, self-contained countershaft, full complement of gauges, saws, wrenches, etc.

1—Preston No. 127 Variety Saw Table, countershaft attached, one 14" saw.

1—Ballantine 36" Band Saw, with solid lower wheel, complete with saw blades, wrenches, etc.

1—Ballantine Two Spindle Shaper, Spindles 20½" centres, diameter of spindles where collars go on 1⅛", top 42" x 42".

1—American No. 1 Single Spindle Shaper. Fig. 937 with plain countershaft.

1—C. M. C. No. 507 Mortiser, with boring attachment.

1—C.M.C. No. 624 Hand Feed Rip Saw Machine, with self-contained counter shaft, table 6'6" long by 40" wide, with plain box gauge, 22" saw blades, 1¼" arbor with cone for receiving saws different diameter.

1—Ballantine 8" Four Sided Moulder, complete with square heads and straight knives on all heads.

1—American No. 2½ Single End Tenoner, with two copes and cut-off saw attachment. Fig. 9431 in American Woodworking Machinery Catalog.

1—C.M.C. No. 646 Roller Table Cut-off Saw, sliding table 7'6" long, stationary table 50" to the saw, sliding table equipped with stop gauge, including five stops, with countershaft, complete with saws, wrenches , etc.

1—Cowan Combination Vertical and Horizontal Boring Machine, complete with wrenches, etc.

1—Hespeler 12" Buzz Planer, fitted with round cylinder, full set of knives, countershaft, wrenches, guard, etc.

1—Preston 36" Band saw, lower web wheel and guards.

8—Sections Cowan Four Screw Veneer Press 12"x50", four sections 27" clear space under screw plates, four sections 32" under screw plates.

1—24" Francis Double Roll Glue Spreader.

4—Sections Cowan Three Screw Veneer Press 38"x12", 28" clear space under screw plates.

1—C.M.C. Arm Sander, No. 438, with paper cutter.

1—Universal Knife Grinder, 37", made by American Wood Working Machinery Co., Fig. 1126 in their catalogue.

1—60" Sturtevant Single Slow Speed Exhauster, left hand, top vertical discharge, complete with platform and rods to suspend from ceiling.

1—Cowan Chain Mortiser with grinder.

1—Ballantine 36" Band Saw, lower web wheel.

1—American No. 3 Double Cut-Off Saw, new machine, capacity from 8" to 6' 9" in length, 4" thick and 30" wide.

1—American No. 25 Edging and Ripping Saw, new machine.

1—American No. 30 Double Arbor Universal Saw Bench, new machine.

1—Preston 24" No. 121 Pony Planer, used only couple of months.

1—McGregor-Gourlay 24" Pony Planer.

1—Mershon Band Rip Saw.

SPECIALS

1—Morgan Two-Arm Shook Fastener, used machine, but in firstclass condition.
1—Used Morgan Eight-roll Box Board Matcher.
1—Used Morgan 12-spindle Double Row Chucks, Open Back Nailing Machine.

153-173 W. Front St., CINCINNATI, OHIO

ACCURACY

That's the main point in a Glue Jointer. It must make at machine speed joints so smooth and straight that they can scarcely be detected in the finished product. Such a machine is

Yates No. 213 Continuous Feed Glue Jointer

The 213 is adaptable to many other kinds of work as well as Glue Jointing, and has so proven itself. With a 213, short and narrow stock can be accurately jointed and glued together, thus saving these small pieces that otherwise would go to the scrap heap.

Get a copy of our New Glue Joint Book. Most comprehensive book on Glue Jointing published. . . . Sent gladly upon request.

P. B. Yates Machine Co. Limited

Hamilton - Canada

No. 605 Self Feed Rip Saw

"BEST YET" is the unanimous verdict of woodworkers whe have examined this RIP SAW.

Pressure on feeding rolls is applied directly in line with the cut, making the cut very accurate. No straining of the feed yokes and throwing stock out of true.

This is just one of its points. Let us tell you of the others. Special bulletin on request.

CANADA MACHINERY CORPORATION, GALT, ONTARIO
LIMITED

Toronto Sales Office - - 721-2 Bank of Hamilton Building.

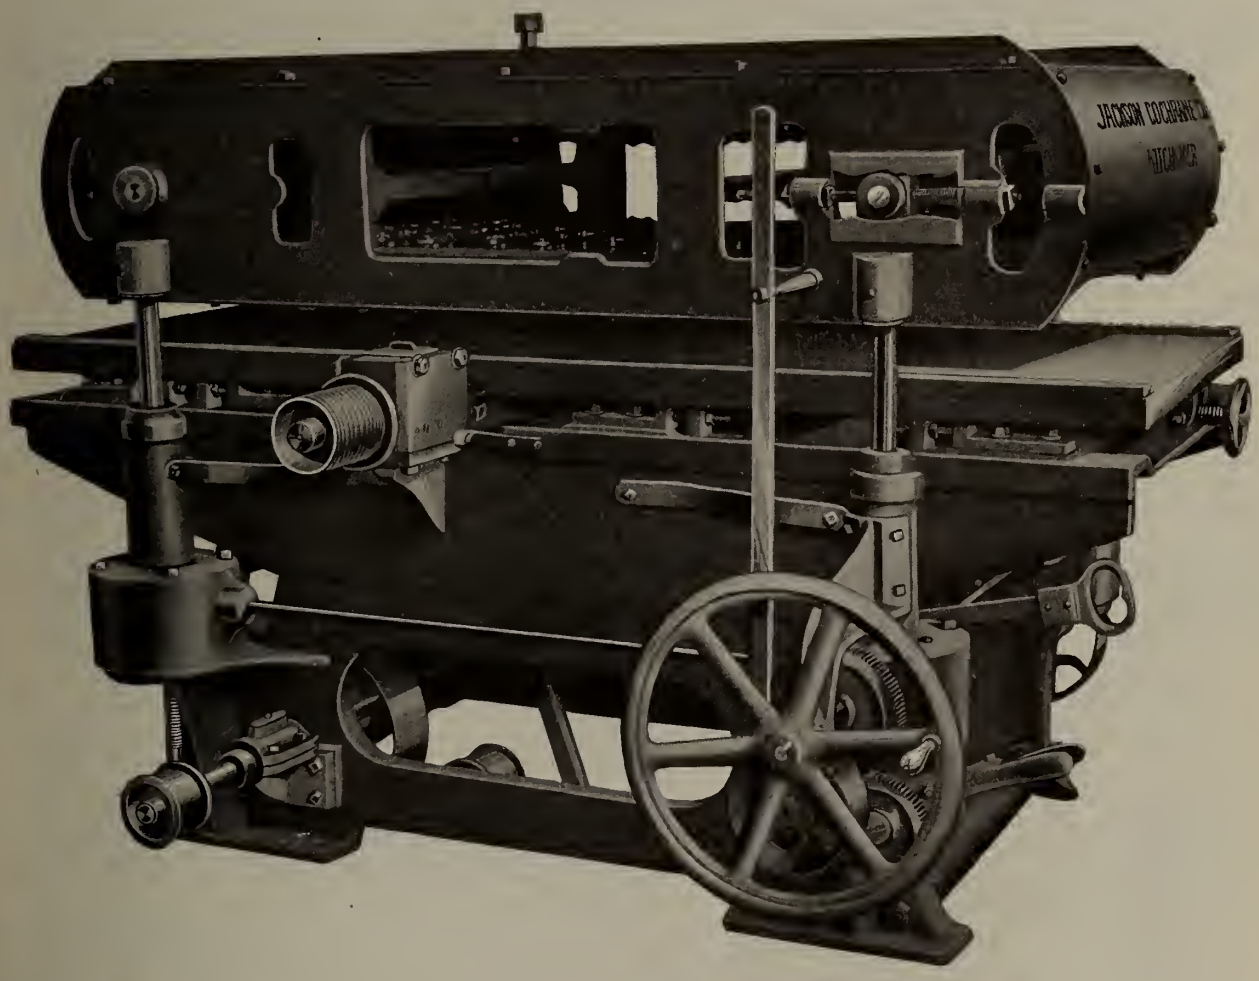
The

Herzog Self-Feed Jointer

means

Increased Production **Simplicity of Operation**
Small Floor Space **Safety to Employees**

Does four times the work of the Hand Jointer



Our No. 34 Herzog Jointer, illustrated above, is one of the most effieient machines on the market to-day. It is appreeiated by the manufacturer and employees alike, beeause, while it will produce from three to five times as mueh work as the hand jointer, it does not require skilled operators, but eliminates the danger so common to other makes. It can be operated by two boys. It will handle stoek varying in width from 1 ineh to the full width of the jointer, will feed fast or slow, takes only one-fourth the floor space of hand jointers, and requires only one-fifth of the sharpening of the knives. It is fitted with power feed raising and lowering attachment, with cylinder double belted and driven from both ends.

If interested in reducing your costs, write us

P. L. Robertson Mfg. Co., Ltd.

Milton - - Ontario

To the manufacturer of furniture nothing could be more logical than the use of the Robertson Patented Socket Head Wood Screws.

It matters little whether the screws are driven by hand or machine, the saving in time and labor is the same. And, of course, with this screw the work is much neater, for the driver never sleps out, consequently scratches and other disfiguring marks are eliminated.

Used by Canada's largest manufacturers.

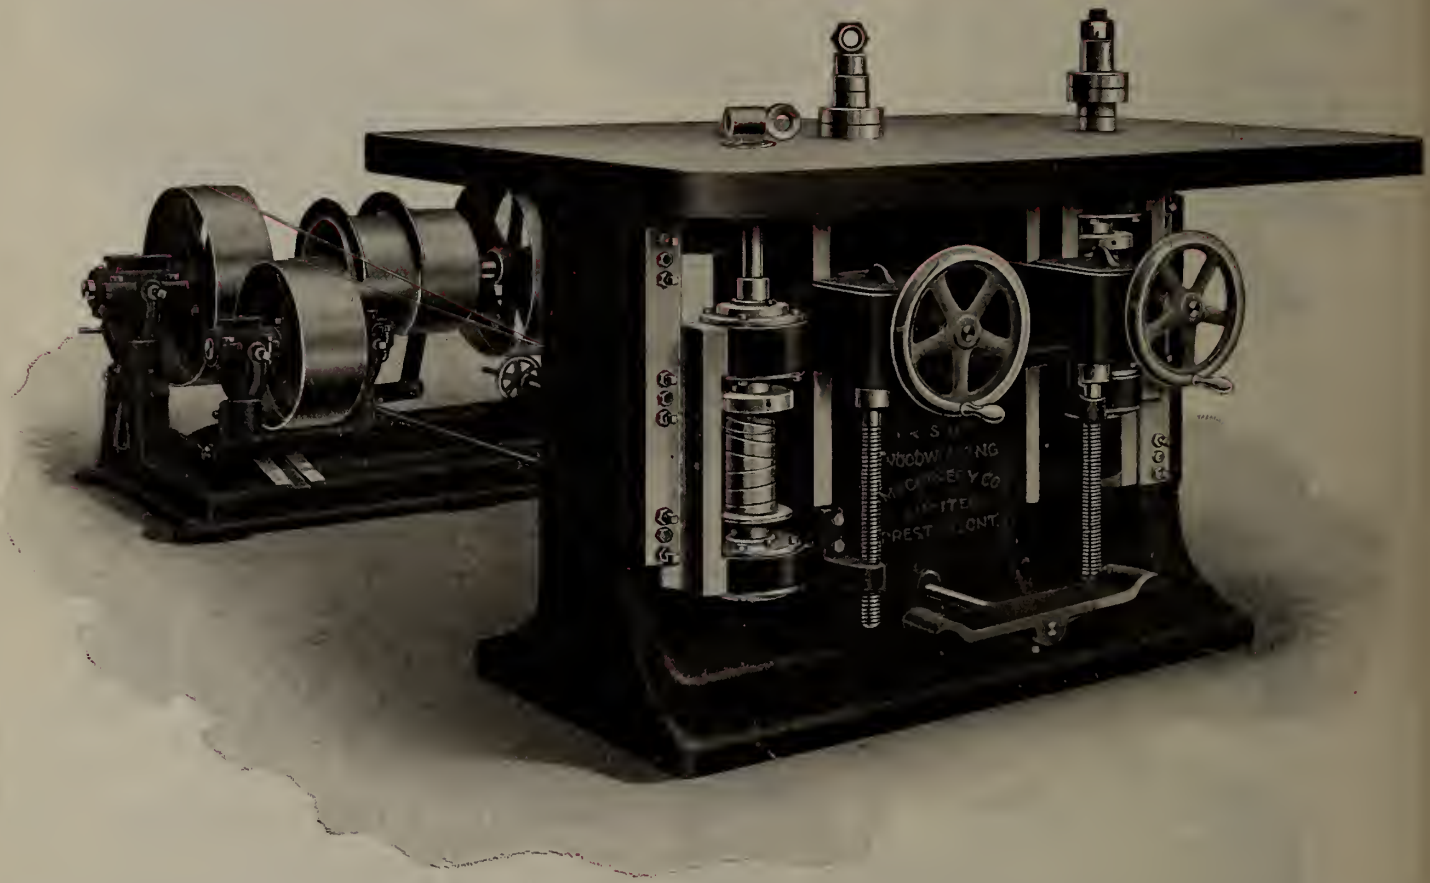
You can Double your Shaper Output

with one of our No. 162

HEAVY HIGH-SPEED BALL-BEARING SHAPERS

and you can also

Improve the Quality of your Work



May we have a chance to prove this strong statement to you when you need a Shaper?

We have specialized in Ball Bearing Shapers for twelve years and offer you a machine having every known and modern improvement. We will gladly furnish you with the names of a hundred users as proof of our claims.

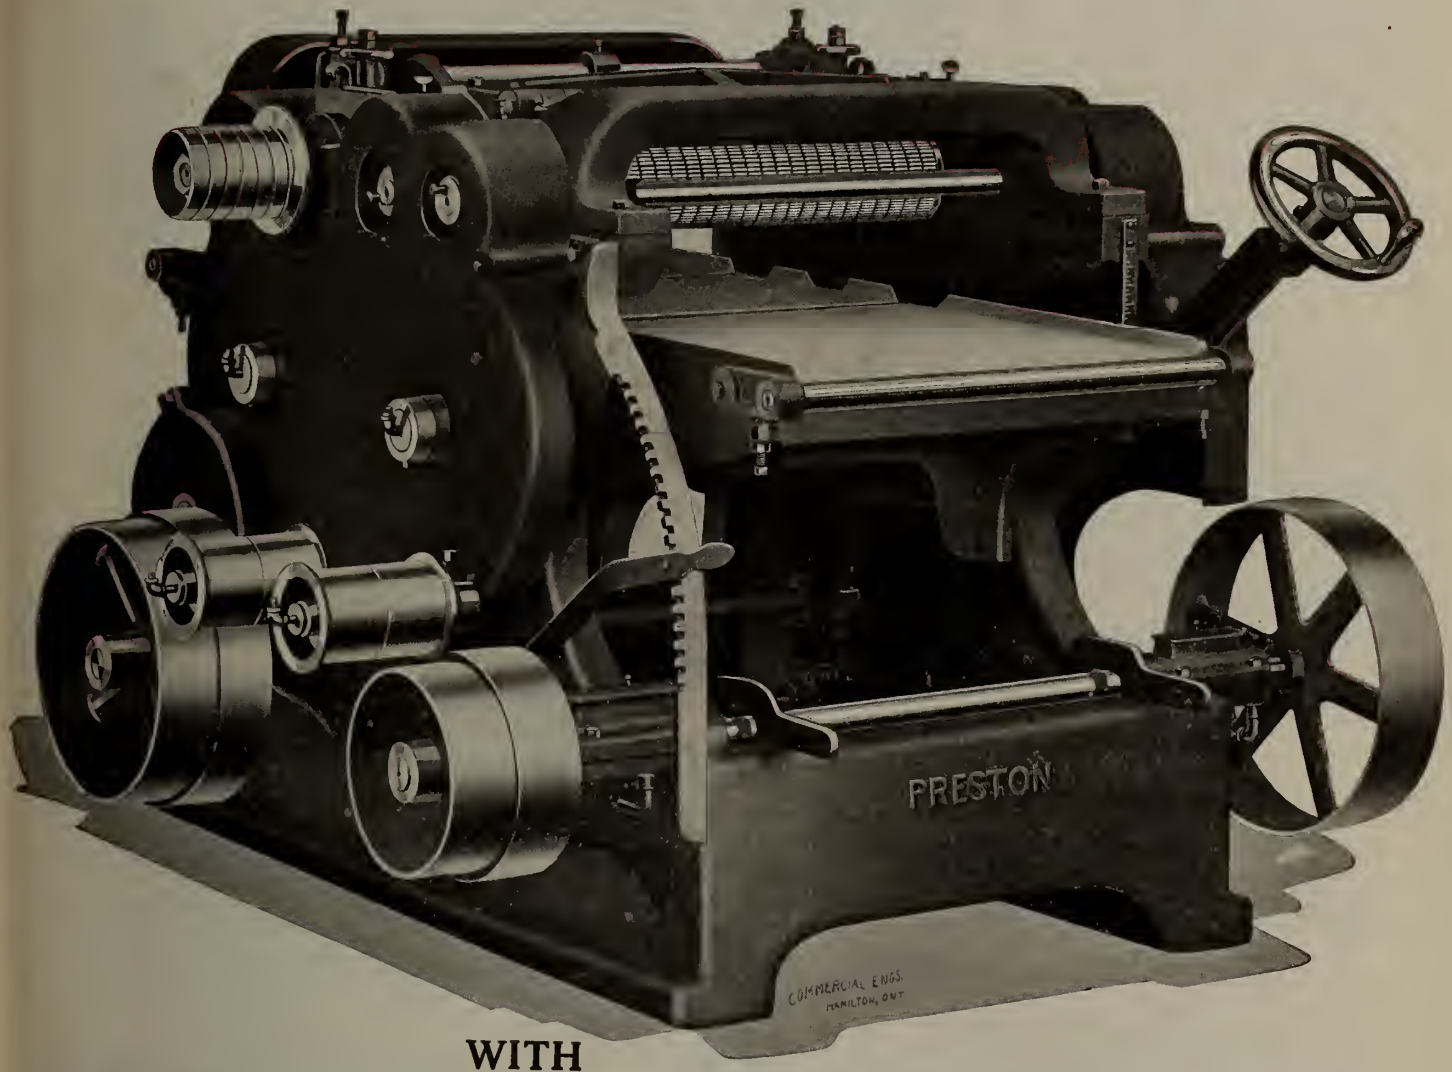
PREDOMINANT FEATURES—Spindle speeds, 7,000 to 12,000 r. p. m. Specially selected S. K. F. Ball Bearings. Weight, 2,850 pounds. Built with either one or two spindles.

The Preston Woodworking

PRESTON,

We are the Sole Manufacturers and Agents of the Eaglesfield Patented Beltless Swing Saw

Introducing a New High Speed Ball Bearing Surface Planer



WITH

(1) Specially selected S. K. F. Ball Bearings (2) Sectional Roll and Sectional Chipbreaker
(3) Round Cylinder with 4 High Speed Knives (4) Stockbridge Knife Grinder and Jointer
(5) Cylinder Speed, 5000 r. p. m.

The above is a cut of one of our No.123-30" single surface Planers recently shipped a customer. We have supplied a number of them within the last two years, equipped exactly as above and would gladly show you the machines in operation in the different plants where sold. Speeded up, as this machine was, to 5000 R.M.P. (or to suit a customer's requirements) there is no question but what production and the quality of the work in any Plant will be greatly improved. It also raises the grade of your stock. Lumber run through our machine can be graded much higher than if run through a slower speed babbitt bearing machine. The machine can be used either as a roughing or a smoothing planer and will give 100% satisfaction.

The Shimer Round Safety Cylinder with High Speed Knives

A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

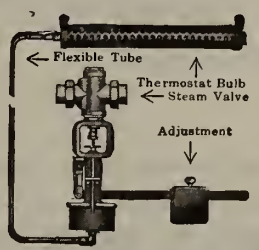
You Don't Guess Time! Why Guess Temperature?

In the glue kettle, the varnish drying room, the dry kiln—wherever there is a need for maintaining a definite, even temperature, the Powers Automatic Heat regulators give "100 percent perfect" results. They are always on the job—accurate, sure, reliable. They prevent overheated glue, checked or case-hardened lumber, crazed varnish—all the errors that are so apt to creep in with manual control.



The Powers Regulator No. 15

Entirely self-contained. Peculiarly adapted for control of drying room, kiln, etc.

Other Powers Regulators for other places. Ask for details.

We shall be glad to give you the benefit of our more than thirty years experience in temperature regulation, and if you will tell us where you would like to try out a Powers Regulator, we will send the right one for thirty days' trial. If you don't find it satisfactory, send it back.

MAPLE LEAF SAWS

Maple Leaf Saws will give you just that steady, day-in-day-out service that means so much in your plant. They are made with this object in view. The whole process of their manufacture, from the selection of the highest grade steel to the time they leave our hands is attended to with the greatest care.
The complete line includes Bands, all kinds of Special Saws for Special Work, Cross-cut Saws, Gang Saws, Dado Heads, etc. Every one guaranteed to merit your approval.

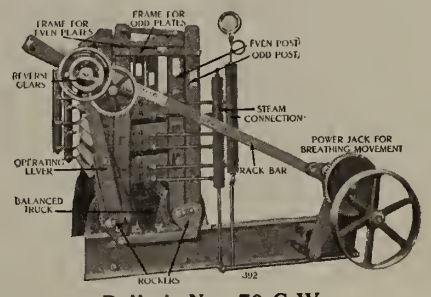
MERRITT ENGINEERING AND SALES COMPANY LOCKPORT N.Y.

MESCO

It pays to install a "Merit" Re-drieer



Bulletin No. 70-C W

Re-drying Veneer

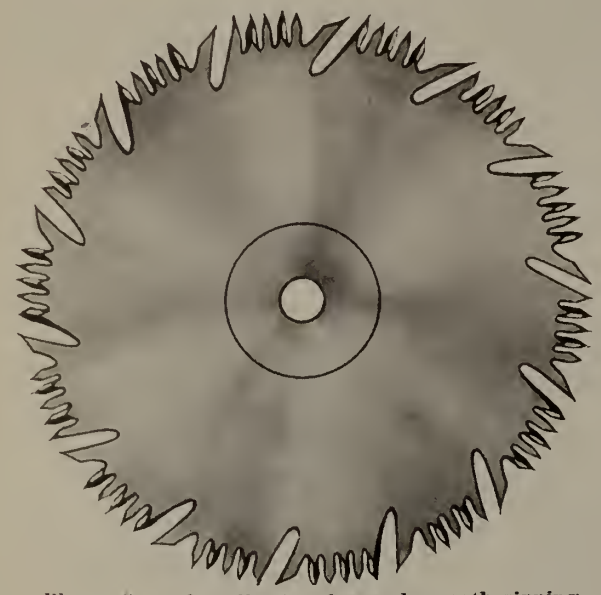
Was not practiced to any extent 10 years ago when the "Merit" re-drier made its appearance on the market. Today very few glue rooms take a chance on veneer that has not been redried under hot plates and very few plants using veneer have neglected to install a "Merit" re-drier. This machine flattens the veneer and makes it absolutely bone-dry. It takes very little steam and is operated by a 2-h.p. motor. It saves glue, simplifies taping and jointing and insures success in the finished product. It is made in several sizes of plate and starting with 4 plates, a machine can later be expanded to 12 or 16 plates.

The "Merit" Line

Veneer Lathes, clippers, driers and re-driers.
Plywood and panel machinery.
Basket and crate machinery.

MERIT

More Accurate Work and Longer Service



Planer Saws for all trimming and smooth ripping.

"Beaver" Brand Hollow Ground Mitre or "Planer" Saws are without equal for smooth cutting. They do not burn and will stand maximum feed. Made with all cutting teeth for X cutting only or as shewn, for rip or X cut work. Do not confound our "Planer" saw with ordinary novelty saw, as they are entirely different in their work, being ground so as to take fast feed, as well as to do smooth work.

Groover Saws used on shaper or saw table.

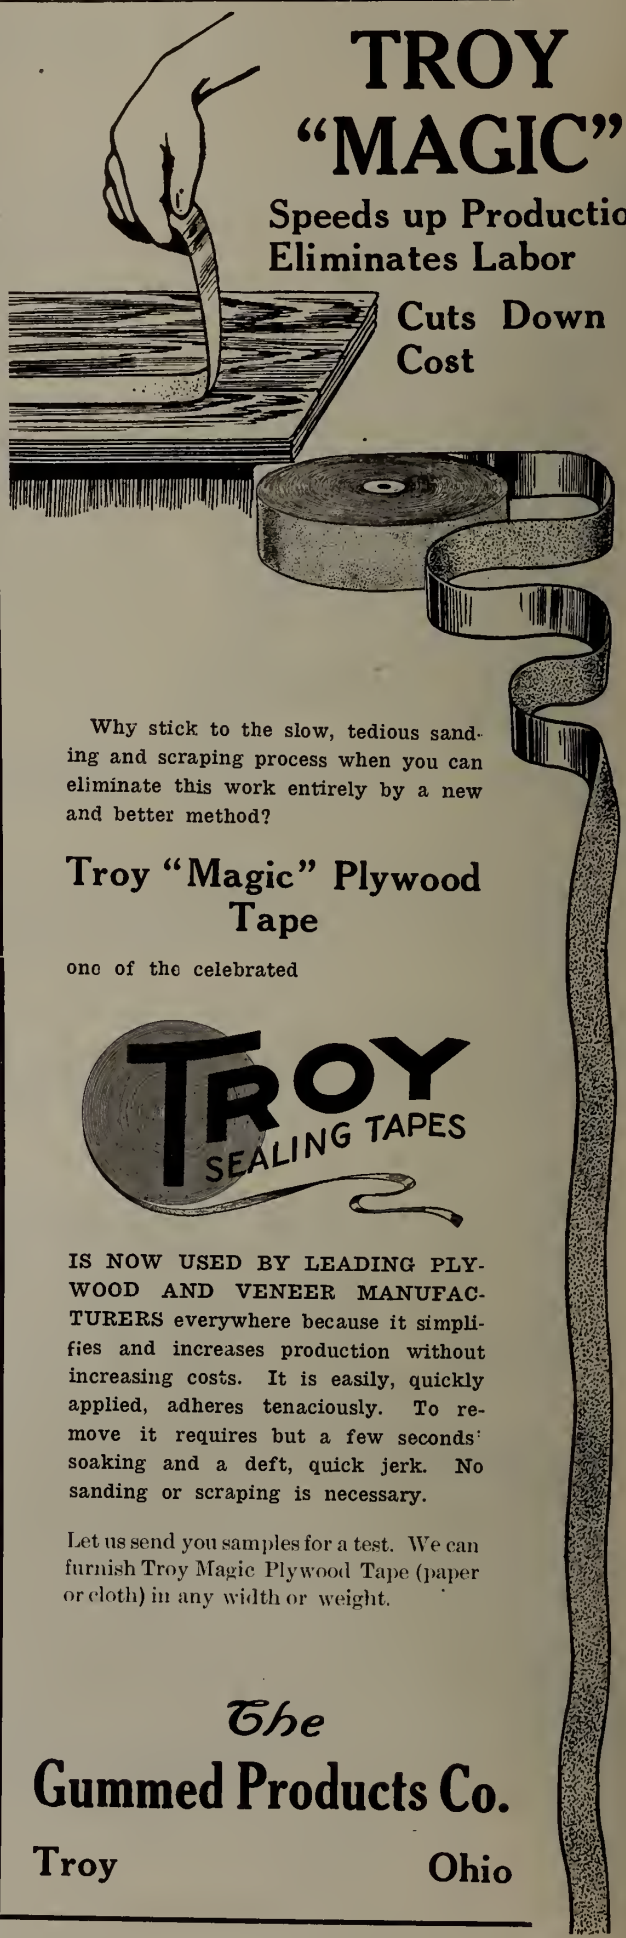
TROY "MAGIC"

Speeds up Production
Eliminates Labor
Cuts Down Cost



Why stick to the slow, tedious sanding and scraping process when you can eliminate this work entirely by a new and better method?

Troy "Magic" Plywood Tape

one of the celebrated

TROY SEALING TAPES

IS NOW USED BY LEADING PLYWOOD AND VENEER MANUFACTURERS everywhere because it simplifies and increases production without increasing costs. It is easily, quickly applied, adheres tenaciously. To remove it requires but a few seconds' soaking and a deft, quick jerk. No sanding or scraping is necessary.

Let us send you samples for a test. We can furnish Troy Magic Plywood Tape (paper or cloth) in any width or weight.

Perkins Vegetable Glue

The Picture Shows The Present Home of

PERKINS 183

TRADE MARK (Reg. U.S. Pat. Off.)

The Solution to All Glue Room Troubles

We will not lower the standard which we ourselves have set and you cannot afford to use anything but the best. Labor costs for poor glue should go into glue costs. Add to your Vegetable Glue Costs your labor bill for allowances on returned goods on account of defective glue; divide that by your output and your "glue line" cost looks different. Add to that cost the indeterminate figure represented by factory troubles and "general irritation" and you will decide that good old PERKINS 183 is the best in the long run.

Process and Product Patents covering PerkinsGlue were granted July 2nd and March 19th, 1912, and have been held valid and infringed by the United States Circuit Court of Appeals. Patents have also been granted in Canada, Great Britain, France, Belgium, Italy and other foreign countries.

Watchful Waiting!!!

Over a year ago Canada entered upon a business SLUMP. This was followed by a postponement, on the part of the manufacturers, of contemplated Dry Kiln developments.

That is an OLD story—NOW we are approximately back to PRE-WAR prices and business is RAPIDLY returning to normalcy.

Why Continue the Policy of "Watchful Waiting?"

Prices Are Right—Time Opportune

Early spring will see an unusual large amount of new business placed upon the market. IMPROVE your drying facilities NOW and be PREPARED to assume YOUR share of the increase in trade—get in, as it were, on the GROUND FLOOR of business resumption. SOMEONE will get this business—WHY NOT YOU ?

NATIONAL DRY KILNS, as the **very heart** of your productive ability, will enable you to compete on the basis of LOWER COST, SUPERIOR QUALITY and GREATER PRODUCTION. We obtain the greater part of our equipment in Canada, which enables you to secure the MOST UP-TO-DATE and EFFICIENT Dry Kiln at the **lowest possible cost.**

The First Kiln in 6,000 years in which Humidity is Automatically Controlled.

NATIONAL DRY KILNS

ECONOMY AND RELIABILITY GOES FAR

LACTOCOL

STANDS THE STRAIN

THE COLD WATER GLUE
IN POWDER

REQUIRES NO HEATING OR RE-HEATING. PREPARED IN A MOMENT BY MIXING AN EQUAL VOLUME OF COLD WATER WITH THE POWDER. YOUR GAS BILL BE HALVED AND YOUR OUTPUT CONSIDERABLY INCREASED BY USING LACTOCOL, THE GOVERNMENT APPROVED GLUE.

LACTOCOL IS SPECIALLY ADAPTED FOR GLUEING LARGE SURFACES, AS IT DOES NOT SET PREMATURELY LIKE CAKE GLUES. IT CAN BE USED FOR THE MOST DELICATE OPERATION OR FOR THE LARGEST WORK WITHOUT THE POSSIBILITY OF FAILURE.

ALL JOINTS MADE WITH LACTOCOL ARE WATERTIGHT AND UNAFFECTED BY HEAT. IT IS GUARANTEED TO WITHSTAND A STRAIN OF CONSIDERABLY MORE THAN 1,000 LBS. PER SQUARE INCH. IT SETS HARD AND THE JOINT IS STRONGER THAN THE WOOD. LACTOCOL IS EASILY APPLIED, GOES A LONG WAY, AND IS PERFECTLY RELIABLE.

Used for all classes of Joinery and Builders' Work either inside or outside, Cabinet Making, Parquet Floors, Wooden Tanks and Receptacles, Upholstering, Built-up Mouldings and Cornices, Carriage Building, etc., etc.

LACTOCOL WAS APPROVED BY THE GOVERNMENT FOR CLASS 1 AIRCRAFT CONSTRUCTION.

Test it against the Glue you are now using. Lactocol has proved itself to be the best and most economical of all. LACTOCOL is used extensively in Canada in the mass production of joinery work.

Manufactured solely by

LACTOCOL LTD., 2 STUDLEY ROAD, LONDON, S.W. 4.

CHAPPELLS LIMITED
Wood Workers and Builders
SYDNEY, N.S., Aug. 1, 1921.

Messrs. Holloway, Randell & Co., Ltd.,
Halifax, N.S.

Dear Sirs,—

Replying to your communication of July 29th, would say that we have tested out Lactocol Cold Water Glue and up to the present are entirely satisfied with results in connection with its adhesive qualities. Another feature which Lactocol has is its price, which we find compares favorably with the ordinary glue on the market; the initial cost is a little more, but on account of its economic quality, we find it is cheaper in the long run.

Yours truly,
CHAPPELLS LIMITED

Pattern Work a Specialty
DARTMOUTH, N.S., June 20th, 1921.

Messrs. Holloway, Randell & Co.,
Halifax, N.S.

Gentlemen,—

We have given your Lactocol Cold Water Glue some very severe tests, namely, joining two pieces of teak, which, owing to its oily nature, makes it almost impossible to join satisfactorily with ordinary glue; also we joined a piece of hemlock to white birch, which withstood heavy hammer blows, and after being submerged in sea water for over 12 hours, still clung together as tight as ever.

We, after making these tests, highly recommend this glue for any kind of woodwork.

Yours very truly,
THE DOUGLASS FULLERTON CO., LTD.
Per H. B. Douglass.

"The Kiln Drying of Lumber"

A Practical and Theoretical Treatise

By HARRY DONALD TIEMANN, M.E., M.F.

In charge, Section of Timber Physics and Kiln Drying Experiments of the U. S. Forest Service. Special Lecturer in Wood Technology and Forestry, University of Wisconsin. Forest Products Laboratory, Madison, Wisconsin.

Second Edition 318 pages.

The value of a technical knowledge of *kiln drying* is self evident. This book, as does no other upon the market, gives the reader the most recent and most clearly expressed information. The text and illustrations guide the way to the most efficient methods of work.

Price $5.00

Hardwood Products
Par Excellent

Buyers requiring an exact standard of manufacture plus lumber cut from good timber will find it in our band-sawn White and Red Oak, Ash, Gum and other Arkansas hardwoods.

In addition to affording a reliable source of supply for these items, we also offer you the practical convenience of filling out special schedules with finely manufactured Oak Flooring, square edge parquetry strips, oak trim and moulding, which can be shipped in the same car.

Ours is a service of unusual scope and value, which it will pay you well to investigate.

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS ALL WALNUT."

AMERICAN WALNUT

"The Cabinet-wood of Infinite Variety."

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS ALL WALNUT."

"THE AMERICAN WALNUT PERIOD."

Genuine American Walnut richly deserves the secure place it has *earned* in the affections of the American people.

Added to its rare beauty of grain and natural rich brown color, is its historic quality of *permanence*, and the positive assurance of entire freedom from warping, shrinking, twisting or slivering wherever this supreme cabinet-wood is used—interior woodwork, broad panels, fine furniture, etc., or in such exacting service as airplane propellers and gun stocks demand.

"The Cabinet-wood of Infinite Variety."

A superior quality of acumen is displayed by manufacturers who are featuring American Walnut furniture, and also *by those who are buying it.* Our advertising is featuring this slogan—***"BE SURE YOUR WALNUT IS ALL WALNUT."***

May we send you with our compliments the American Walnut Brochure de Luxe? An interesting story of Walnut's history.

"The Canada Lumberman" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free duscussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements. Sample copy and full information on request. Head Office, 349 Adelaide St. West, Toronto.

"What Others Say"

"Your letter of February 15th received and we want to say that this was a very nice lot of lumber. It was good widths and lengths and well manufactured, dry stock and the grading was very liberal. We are sorry we cannot use more of this lumber at the present time. *We received several cars from other manufacturers at a cheaper price but the lumber was not nearly as satisfactory.* When we are in need of more stock we will take the matter up with you."

(Note—The above was sent us February 24, 1921 unsolicited. Name given on application).

MAHOGANY

Rarely are such stores of precious wood to be found as may be seen in our yards. Across the seas from tropic lands it comes. From thick jungles where the light of day but dimly penetrates and where tangled native paths make difficult the bringing out of timber. Here the black man labors, risking life from jungle dangers, that supplies will not diminish and your orders may be filled.

Twelve million feet per year is the capacity of OTIS mills. An adequate supply is always on hand for prompt shipment. Get our prices.

This yard was BUILT for perfect drying. The appearance of the piles will convince every man who knows hardwood lumber.

Lumber Can't Be ALWAYS Good Without Perfect Piling

The *correct* drying of hardwood lumber is a science based on definite formulae. Recognizing this, our yard was ***built*** to insure the most perfect possible drying.

Everyone familiar with lumber will recognize what the appearance of the piles in the accompanying photograph means. They are your guarantee of flat, straight, clean lumber.

Our list includes the standard species and grades of southern hardwoods with NOTHING PICKED OUT, and has behind it a comprehensive and conscientious desire to give the customer his full measure of value and service,

Wisconsin Lumber Company

Chicago, Illinois

BAND MILLS, DEERING, MO.

On October 17, 1906 the S. S. "Corinth" sailed from Axim, Gold Coast, Africa, to Pensacola, Florida, with the first full cargo of mahogany logs ever shipped from the continent of Africa.

Prior to 1860 complete cargos had sailed from Africa, but the holds were laden with human freights from which was manufactured the great American Civil war.

From the valuable cargo aboard the "Corinth" was produced the beautiful and the useful—a contribution to the prosperity and civilization of America.

To the successful venture of this pioneer ship is largely due the position and influence of African Mahogany in the wood artistry of today.

It is immaterial that the Mengel Company were the operators of this ship and the owners of this cargo.

Vol. 21 Toronto, October, 1921 No. 10

Will There Be Lumber Shortage?

Recent issues of the "Canadian Woodworker and Furniture Manufacturer" have contained pointed reference to the lumber market. Lumber users have been almost urged to buy while prices were favorable, and a good assortment of stock available. The suggestion was made and repeated that the opportune time in which to purchase lumber could not last indefinitely, that it was rapidly drawing to an end.

From information and reports at hand, it would appear as if this period has definitely passed, and that we are facing a period of strengthened demand and higher values. During the past few weeks prices on many items, chiefly the better grades, have advanced from $5.00 to $10.00 per M, while at the same time upper grade stock is rapidly disappearing from the market, and as a result is becoming increasingly difficult to secure.

Many manufacturers have not heeded our warnings. No doubt they felt that as the demand for their product was none too strong, it was not advisable to load up with raw material under such conditions, or, perhaps, they believed that lumber prices would recede still further before they stabilized or stiffened. We believe that we are acting in the best interests of those who have permitted their supply of lumber to run low when we attempt to drive home the seriousness of the present situation.

The mere fact that lumber values have moved up a few dollars is neither here nor there, for such an advance can be readily taken care of by adjusting the selling price of the finished product or could, perhaps, be absorbed without curtailing profits to any great extent. The danger lies in the fact that the better grades of hardwood are scarce, are rapidly disappearing from the market, and the strong possibility that the next few months will witness an acute shortage, if not an absolute famine of hardwoods in all grades above No. 2 common. The belief is general that there is a strong pent-up demand, and when once the gravity of the present situation is fully realized, there will be a rush to cover and all desirable material will be rapidly taken up.

If you do not agree with our outline of conditions in this field, a few inquiries among lumber manufacturers should either confirm or disprove our contention. If your stock of lumber is getting low, you owe it to yourself to, at least, investigate the market and see how easy or how difficult it is going to be to secure the material needed to tide you over the next six months or year. It is anything but pleasant to find that the lumber needed to supply the increasing volume of business which is offering cannot be secured, regardless of price.

Fire Loss in Canada Still High

Sir Henry Drayton, Minister of Finance, in addressing the Dominion Fire Prevention Association at Ottawa recently, touched on Canada's fire losses, which, he said, were ten times as heavy per capita as those of Great Britain. The result of this is that high premiums are being charged, so that insurance costs five times as much in Canada as in the Mother Country. These premiums can be reduced in the exact ratio that we are successful in reducing this enormous loss.

The figures for 1920 show a total loss of about $30,000,000, or a little in excess of $300 per capita. Many do not realize the seriousness of this high toll which is taken annually of our resources. The opinion is general that because certain of these fire losses are fully covered by insurance that no loss had been incurred. This is an utter fallacy. Everything destroyed by fire is lost. Our national assets have been reduced by the amount of that loss, and whether or not the insurance companies reimburse the loser, does not alter this fact in the slightest degree. In any event we provide the money with which the insurance companies liquidate all losses.

In this connection the woodworker must shoulder a large share of the responsibility. His is a hazardous occupation. Every issue of the "Canadian Woodworker and Furniture Manufacturer" contains reference to fires which have occurred in woodworking establishments. During a year the loss in this one industry alone reaches a startling figure. A considerable proportion of this loss is due to carelessness and to the fact that preventative measures have not been put into effect. While such equipment as automatic sprinkler systems, fire engines and extinguishers offer an admirable protection against fire, those who do not wish to incur such expense can solve the problem, partially at least, by keeping their plant scrupulously clean and by seeing that all stock stored in their factory is kept in an orderly manner and by taking other simple precautionary measures which will suggest themselves.

Injustice of Guesswork in Piece Rates

Why Piece-work is Not Popular — Responsibility Does Not Rest with Employer Alone—Reliable Basis for Computation Available—Should Help Rectify Industrial Situation

By WM. SNAITH, Associate Engineer
Forest Products Engineering Company, Chicago.

The old lady who said that all she knew about the doctrine of total depravity was that it was a good doctrine, would feel quite at home in our midst to-day. Poor old human nature may not be totally depraved, but it does some things that show it has got a long way to go to attain unto perfection. The perversity with which modern civilization turns the best things discovered for it by science, into methods for blotting out considerable portions of the human race has been indelibly impressed on the present generation of the sons of men. It is largely fortunate that we did not know much more than we did of high explosives, or airplanes, or gases. There would be fewer still of us left to attend to the world's work.

The way in which the principle of piece-work has been handled in the modern industrial system is another example of the same kind of perversity. For the sake, as much of the employee as of the employer, it is almost a tragedy that the fairest way of paying for labor should be as discredited as is this. There is no mystery surrounding the cause of this discredit and its existence is universal. Piece-work has been wrecked on the rock bearing the motto, "Peace rates were made to be cut." The salvaging of the ship will be a long and tedious process. It will be accomplished by men who do not believe that promises were made to be broken, by men who know that honesty IS the best policy. They will have to work against heavy odds, there will be many slips and much hard work, but they will ultimately succeed, because what they are working for is fundamentally right.

Employer and Emplyee Equally Responsible

The responsibility for piece rates being cut does not rest alone with the man who does the cutting. This is perhaps not obvious. I get a job and undertake to work for you. The contract implied between us is that I shall deliver to you as good a day's work as I am capable of and you, in return, are to pay me so many cents an hour. After a while you offer me a new contract under which I can make more money, if I will turn out a stated quantity of work in a certain time. In other words, I go on piece-work. Now you based your offer (piece-work price) on what I delivered to you as my idea of a fair day's work. When I found I could make more money by digging in a little harder I dug and made quite a good thing for a while. Then, you cut the rate. I thought it hardly fair, but I could still make money at the new rate, so I kept at it, found I could do better still, did it—and you cut again. This time I didn't go after the rate and try to beat it. I figured that as long as I didn't earn over so much a day you would be satisfied, so between us we succeeded in curtailing further increases in production. We both lost out on the deal, and the financial loss was less than the intangible loss in good-will. I had thought you were "square," and when you undertook to pay me so many cents a piece I thought you'd do so. When you cut the price it seemed to me as bad as breaking any other kind of a contract. It never occurred to me that I started it when I delivered a smaller day's work than I proved afterwards I was easily able to do. You no doubt felt that if you hadn't put me on piece-work I would have done you out of considerable money. Well, we won't get anywhere by calling each other names. We were neither of us fair because we both guessed. I guessed at a fair day's work and you guessed at a fair piece rate. Both of us guessed wrong and both of us got in wrong fixing up our mistakes.

Must Not be Set Haphazardly

So much for the responsible for the discredit which has nearly made a complete wreck of the principle of piece-work. The fundamental cause of the trouble is that the rates were guessed at. The closer the guess happened to be the less trouble was caused, and some guesses are bound to be right. But guesswork is a poor foundation for anything. Of course, we wouldn't be getting anywhere with all this discussion if there were not other material for foundation purposes. Piece rates are now set after a careful analysis of time studies and the amount of effort or skill is gauged accurately. The man of unusual skill or ability is paid more than the less ambitious worker and rates are not cut.

Piece-work is not only the fairest way to pay for labor, but this principle is tacitly conceded by the universal attitude of doubt which the departure from it arouses. The doctor's charge of so much per visit is piece-work and easy to justify or understand. The charge for an operation, based on the size of the patient's bank roll, is held up to ridicule as a joke. It is not easy to see the justification for it or for an unitemized lawyer's bill.

Most of the things we buy are measured out to us: so much for so much money. Coal is so many dollars a ton; sugar costs a definite number of cents per pound; milk is sold by the gallon and eggs by the dozen. A dealer who would suggest that for a dollar he would deliver an unstated amount of sugar would get no trade. Yet unstated amounts of labor are all that are bought for dollars under the day work plan. The result is confusion in arriving at present and future costs. Most manufacturers have to make their product within certain very definite limits of cost. Cost of material is readily ascertained, but what will be paid for labor is not so easily known when piece-work is not the rule.

We are coming to a realization of many fundamental truths nowadays. If manufacturers can get orders, there is employment. The one who can do the work cheaper than the rest gets the most orders. The nation which can produce the most goods, over and above its own needs, can exchange them for the greatest amount of goods from other nations, raising its standard of living. Many things contribute to our prosperity and piece-work is undoubtedly one of them. It is supremely important that piece rates be just and justice can only be secured if guesswork is allowed no place in the calculation of any piece rates.

Better Furnished Homes Campaign

Furniture Manufacturers of Canada Launch New Publicity Campaign.

Seal of Home Furnishings Bureau to be Featured in all Advertising

By R. W. WELLS

Another general advertising campaign is to be launched shortly by a number of the furniture manufacturers of Canada working through the Home Furnishings Bureau. The plans for this publicity effort are about complete, and it is anticipated that the opening advertisements will appear durng the next week or two.

In many ways the present is a particularly opportune time for a sales-compelling campaign of this kind. Business is showing signs of an awakening, the demand for furniture is slowly but surely increasing; advertisng is always more effctive on a quickening market, as instead of having to overcome a certain amount of indifference and inertia on the part of the buying public, the full weight of all publicity work goes toward stimulating and increasing sales. Not only that, but coming at this time, it should have a beneficial effect on the Christmas demand for furniture.

This campiagn will be along similar lines to the one conducted last fall, only on a more moderate scale. Twenty newspapers, selected for their standing and the extent of the fields covered, will be used, and each paper will run thirteen different advertisements, at the rate of two a week. Through these twenty mediums it is hoped to reach the majority of those in Canada who are interested in furniture and home furnishings.

Bureau Trade-mark to be Featured

A feature of the campaign will be the use of the seal or trade mark of the Home Furnishing Bureau, which is to appear in all the advertising. The trade mark will thus be linked up with the idea of better furniture, and the result should be that many buyers will show a preference for pieces which carry this seal, for to them it will be an assurance that the furniture in question is the product of a reputable house and is well made in every respect.

This trade mark, which is shown in the accompanying illustration, has been registered at Ottawa with each member of the bureau as a registered assignee. Thus all members have the right, which they are strongly urged to exercise, to use this seal in all their advertising, whether general or direct by mail, and also to have it appear on all stationery, billheads, etc. It is hoped that those behind this campaign will use this seal to such an extent that in the minds of both dealer and the buying public, it will become synonymous with good, dependable furniture, well made and well finished. The use of this trade mark will also indicate to the dealer that the manufacturer using it is heart and soul behind the Home Furnishing Bureau in all its activities. It will in a way show the dealer who his friends are.

The plan which has been prepared for this campaign is a little more direct than the one followed last year. While no mention is to be made of any particular line or any particular style of furniture, twenty-six advertisements have been prepared, each illustrated by a room scene in which the furniture shown has been taken from the line of one of the supporting manufacturers. Thus the series of advertisements to be run will give publicity to furniture produced by each of the twenty-six members of the bureau.

Campaign Made More Direct

In an endeavor to make this publicity more effective from the point of view of direct sales, the furniture retailers are to be supplied with a portfolio containing proofs of the twenty-six advertisements which go to make up the series, and at the same time informing them whose furniture is used to illustrate each piece of copy. Each member of the bureau will be furnished with a programme, giving a list of papers,, and the dates on which his particular advertisement is to appear. Thus he will be in a position to use this advance information and suggest to the dealers in a certain district that the advertisement of the Home Furnishings Bureau, which will appear in their local paper on a certain date, is featuring such and such a suite. The suggestion can also be made that the furniture retailer make a special drive on this particular suite for the week in question, featuring it in his window and perhaps doing a little special advertising on his own account. In this way each member stands to gain some direct benefit from the advertising as well as share in the increased demand for furniture which will assuredly result from publicity work of this kind.

Publicty Work Should be Continuous

It is to be hoped that after having profited by the mistakes of the past, the furniture manufacturers of Canada will back the Home Furnishing Bureau persistently and consistently. General publicity of this nature must be planned well in advance and carried out as part of an extended campaign. Public opinion and public tastes cannot be influenced and moulded in a day or in a month. It is a case where it is necessary to keep everlastingly at it. Last fall the campaign was carried to a point where it was beginning to show results, and then dropped. This was a mistake. It is more than probable that if last year's effort had been continued on through 1921, instead of having fallen through, the total volume of furniture sales for the present year would be hundreds of thousands of dollars, if not a million of two, ahead of what it will be.

A word of warning is, perhaps not out of place. In their desire to have this advertising made more direct, the members of the bureau must not lose sight of the fact that a campaign of this kind must necessarily

be general in its scope. To be most effective it must be so planned and conducted as to sell ideas rather than individual pieces or suites of furniture. The demand for furniture can be increased and the Better Furnished Homes Campaign carried out successfully by emphasizing the comfort and pleasure to be derived from a well-furnished home, by touching on the desirability of fine furniture, the pride of possession, by emphasizing the fact that furniture at present prices is a good investment, that good furniture is a necessity, not a luxury, by touching on the influence of well-furnished homes, not only on the home life, but on the life of the nation, and, lastly, by instructing the public as to how they can improve the furnishings of their home and show good taste in theselection and placing of the furniture and furnishings.

The following is a list of the furniture manufacturers who are supporting thee oming publicity campaign: Canada Furniture Mfrs., Woodstock; Stratford Chair Co., Stratford; McLagan Furniture Co., Stratford; Snyder Bros. Upholstering Co., Waterloo; Knechtel Furniture Co., Hanover; North American Furniture Co., Owen Sound; J. C. Mundell & Co., Elora; Strathroy Furniture Co., Strathroy; Meaford Mfg. Co., Meaford; Baetz Bros. Furnitnre Co., Kitchener; Jacques Furniture Co., Kitchener; Gibbard Furniture Co., Napanee; Andrew Malcolm Furniture Co., Kincardine; Malcolm & Hill, Kitchener; Schierholtz Furniture Co., New Hamburg; Owen Sound Chair Co., Owen Sound; Beaver Furniture Co., Kitchener; F. E. Coombe Furniture Co., Kincardine; North American Bent Chair Co., Owen Sonnd; Kindel Bed Co., Stratford; Baetz Bros. Specialty Co., Kitchener; J. B. Watson Furniture Co., Kincardine; Andrew Gray Co., Owen Cound; Anthes Baetz Furniture Co., Kitchener; H. Krug Furniture Co., Kitchener; Malcolm & Souter Co., Ltd., Hespeler.

The Top Sergeant in Woodworking Industry

Key Positions Held by Foremen—Logical Man to Handle Production and Efficiency Problems—Can be Trained to Render Greater Service

By RALPH S. FOSS
Vice-president, Business Training Corporation, New York.

Much is being written these days as to the waste in the woodworking industry—waste of material, waste of time, of effort, of energy, and of power. In common with other industries, it holds out a constant invitation to business doctors to help it over its periods of stress and strain. Remedies are being suggested that may prolong the life of the patient, but in few cases will they effect a permanent cure. A powerful drug may get the patient on his feet again temporarily, but, if there is something organically wrong with him, a cure will have to be wisely administered and patiently endured.

The woodworking industry has gone through many fluctuations within the past ten years. First came the campaign to modernize equipment, then to modernize shop methods, then to stimulate production and to harmonize industrial relations, and so forth. When labor was scarce and demand was heavy, "production at all costs" was the watchword. Manufacturers were driven to radical expedients to placate labor, and many were tempted to grasp at Utopian schemes proposed by social dreamers in order to keep peace in the family. Now that conditions are reversed and labor is begging at the gate for employment, another set of grim-faced specialists are knocking at the door to advise the manufacturer on reducing wages, fighting unions, eliminating waste, and turning his shop into a cold-blooded piece of mechanism.

Where Responsibility Lies

While many manufacturers have yielded to the hysteria produced by these extreme conditions, trying to take advantage of temporary ups and downs through the use of patient nostrums, others have been calmly getting their houses in order on a permanent basis by putting all of these problems of production squarely up to the logical man—the foreman on the job. After all, what problem is there in manufacturing—be it industrial relations, safety, lowered costs, better quality, wage adjustments, increased production, or anything else—which will not ultimately yield to the pressure of intelligent, broad-gauged, energized foremanship?

The right kind of a foreman is usually able to keep his team functioning harmoniously; he smooths out misunderstandings among the men, and stimulates them to better effort. If a wage reduction is necessary, he can "sell" his men on the idea, because he has their confidence. If an improved system of costs is introduced, if better methods of routing and dispatching are worked out, the foreman is the man who makes these plans succeed or fail. If he has a clear understanding of the principles on which efficient production must rest, he can then co-operate intelligently with the planning and engineering departments.

Importance of Position Not Realized

Few will gainsay that the key to most improvements in the shop is the foreman, and that if a plant has nothing but able foremen and assistants there would be fewer labor troubles and more economical production. The real difficulty is that the average foreman does not measure up to these requirements. And this is not entirely his fault. The mere act of loading responsibilities on a man does not necessarily qualify him to discharge them effectively. In the normal woodworking plant, for example, a workman perfects his craftsmanship over a period of years, gets a reputation for being conscientious, reliable and efficient, and then one day the superintendent calls him to the office and says, "Bill, I have decided to make you foreman of your department." The next day Bill takes on his new duties with an amazing amount of ignorance about every one of them. He may have a genial personality which enables him to get along pleasantly with the men under him. His knowledge of the machines and processes comes in handy, but his executive ability, never having been developed, breaks down when the slightest strain is put upon it. Instead of being a workman with

nothing but his own job to think about, he is now a representative of the management and has to carry out its plans and policies. These duties are so different from the ones he formerly had that several years are usually taken to get adjusted to them, and in many cases the adjustment never takes place. As for constructive work, he usually has such a hard time catching up with the many requirements of his job that he never develops the baility to put new ideas into it.

How Foreman May be Developed

It is only recently that this state of affairs has been clearly realized by manufacturers and steps taken to correct it. Since it has been found that investments in improved equipment and industrial engineering can only be made profitable by having enlightened foremen, plant managers have been addressing themselves to the fundamental problem of training their key men in the principle of management in an endeavor to make real executives out of them. If we grant that enforced improvements in plant management can be secured chiefly through improved foremanship, then the only question is: what kind of foremen development will yield the quickest and most lasting results? There are three alternatives open to any plant:

1. Improvise a course of its own, which consists mainly of get-together meetings to discuss plant problems.
2. Utilize a standard correspondence course for the group, with one of the executives to lead the meetings.
3. Call upon an experienced organigation specializing in foremen development to take the full responsibility of conducting the program.

Of these three alternatives, the thoughtful manager who wants the thing done right will hesitate to adopt either of the first two. Experimental efforts by men inexperienced in foremen training have not usually been successful. Correspondence courses without skilled supervision have been equally unsatisfactory. Such experiments, it is true, have helped create esprit de corps, but they naturally do not get very far in educating the men. There has been a growing conviction that the training effort should be well-organized and systematic, requiring a definite line of study for the individual in addition to an opportunity for group discussion.

A movement of this kind which has been uniformly successful is that developed by a New York organization, specializing in this field. By means of especially prepared text material, problem work, and lectures, the foremen are given a three months' intensive group training on the subjects of teamwork, handling men, organization, costs, control, and management. The reading of the text material provides instruction in basic principles and the men apply these principles to concrete factory situations that are presented to them in the form of problems. Their solutions are forwarded to a central staff for comment and criticism, and are discussed at the group meetings which occur bi-weekly. The instruction is simple and stimulating, and is tied up closely to the questions that confront the average foreman in discharging his daily duties.

Permeating existing industrial organizations with the spirit of understanding and teamwork is only possible, however, through mass instruction and the common content of what is read and taught through that means goes a long way. It is not essential, nor is it possible, to make it go the same distance with all members of a group. When this preliminary work is thoroughly done, however, education has come into the plant to stay, and it then branches out according to the preferences and educational status of the individuals. This is often reflected in the organization of a permanent foremen's club wholly on the initiative of the men themselves. Such training is organized and conducted so as to start the mass of executive ability in any one plant thinking to some purpose, and to energize the plant as a unit. By getting all the key men in the plant together, including some of the white-collar men in the office, and giving them an intensive study in modern production methods as applied to their own manufacturing problems, more teamwork and more economical operation inevitably follows. In the furniture industry, which requires an unusual combination of quantity production and variety of product, and in which the elements of design, quality and workmanship are essential, the problems of supervision are unusually vital and make greater demands, perhaps, than in other industries.

The Big Lesson Wrigley Learned in Dull Times

"The result of my investigation was that I signed up in the midst of the depression of 1907 for $1,500,000 worth of advertising—our first national contract and a very large one indeed for us at that time. It was, as you see, another restraint in the face of an opportunity for immediate profit.

"But for once the policy did not involve the sacrifice of immediate profits even. We really had expected it would. We were after the vivid impression we thought we could make on dealers and consumers at a time when so few people were trying to sell them, and we were willing to pay something for that. We were willing to wait for our returns. But we did not have to wait. They came generously enough even the first month to meet what had seemed an enormous first payment on the advertising, due at the end of the month, and the payments every month thereafter were entirely met out of the increase in our profits, with a continually widening margin to spare."—Wm. Wrigley, Jr., in "System."

The man at the cross-cut saw can spoil more wood in a day, if he is careless, than any other man in the mill.

The Fabricated Building Co. is the name of a partnership recently formed in Vancouver, B. C. John E. Baxter and E. C. Blackwell are two of the organizers.

The toy factory at Murrayville, B. C., conducted by Hugh A. Gosling, was recently destroyed by fire. Mr. Gosling plans on rebuilding on a new site he has secured at Milner, B. C.

Application of cost system described, to sash and door and special order work.

A Tried and Tested Cost System

Woodworking Industry not Devoting Enough Attention to Costs—Many Operators Accept Work Below Cost—Outline of Time-proven Cost Keeping System.

By W. WARREN

I have read, with much interest, the article which appeared in the July "Canadian Woodworker" under the title of "A Study in Millwork Costs." The report, which was included in this article, has many good points. It appears to me, however, to be a compilation of estimated costs rather than concrete tests of actual work performed. The proven cost of to-day is the basis on which we estimate our work to-morrow, and unless we work out our costs accurately, they are worse than useless, and so reduce the art of estimating to "guesstimating."

There are several features in this report to which one might take exception. First—The absence of a definite size of window frame and full description. Second—The absence of actual cutting bills of each and every piece of material used in the job. Third—The small percentage of waste allowed, in this case only 15 per cent. Fourth—Machine work and assembling should be separated as factory burden differs greatly on the two trades. Fifth—50 per cent. overhead is inadequate and should not be so charged. My experience is that 50 per cent. factory burden is the correct amount to add to bench or assembling operations, and that 100 per cent. should be added to machine work. The overhead should not be confused with factory burden, but should be applied to both labor and material. Burden and overhead (or commercial burden) may differ according to local conditions, and should be worked out and proven in each individual plant.

Brief Outline of System

I append two actual costs of work done, which I think are self-explanatory. It is not possible to keep cost on a portion of the work passing through a plant, nor is it wise to endeavor to do so. A cost system will only function properly when correctly instituted and operated. Burden and overhead cannot be accurately computed on a partial system and as an estimating basis it is useless unless all classes of work are covered. This also refers to trim, sash, doors, etc., no matter whether manufactured by ourselves, purchased, stored and resold. We should keep cost on all we handle. The same principal that applies to frames and sash will also prevail on any detail work.

Our method of keeping cost is briefly as follows: All orders are entered on triplicate order forms, consecutively numbered. The original is kept by the order clerk until the work is completed, and while in his possession it is filed alphabetically so that in the event of reference, it is more readily found by name. The second copy is held and filed numerically by the shipper until the work is shipped out or delivered. The third copy is held and filed by the cost clerk. From this he opens a cost card under the name and number shown on the order, a detailed factory order is then issued to the foreman and the work gone ahead with.

Used as Basis for Estimating

From the information contained in this factory order, together with details, the layout man prepares a cutting bill, giving actual dimensions of every piece of material in the job. This cutting bill then goes to the break-out room and follows the job during its progress through the plant until it is fully complete. After the work is completed, the cutting bill goes to the cost clerk, who works up the material and enters same on the cost card. As the order passes through the factory, every workman who handles any phase of the work places his time on a tally time card. This applies to each and every order, regardless of size. At the end of each month all orders completed are tabulated on a monthly recapitulation, and so the result of each month's business is shown.

Samples of cost of various types of work are entered in an estimate book. Upon these figures we base all our

estimates for the current month. This, we contend, keeps our estimating department properly informed and enables them to quote with a satisfactory degree of accuracy.

Quantity of Waste Misleading

In allowing for waste, experience has taught me that the minimum that should be allowed is 25 per cent. Naturally the amount will vary according to the class of job and grade of material used, in some cases amounting as high as 50 per cent. and in exceptional instances exceeding this latter figure. Many owners and operators of woodworking plants will not admit this quantity of waste. In that, they are simply living in a fool's paradise, and some day, perhaps too late to rectify this error, they will discover that waste has drained their business dry.

No manufacturer can afford to operate a factory without a cost system. To the uninformed it looks like a big innovation. It is not so costly as one might at first anticipate. An accurate cost system can be maintained at an outlay of 1 per cent. of the business done. I know of no investment which is capable of paying such dividends as an efficient cost system.

It is not fair to our competitors to estimate and operate without an accurate knowledge of costs, neither

is it fair to our customers, for we are apt to charge one too much and another too little. It has been demonstrated time after time that those concerns who do not keep costs and who have no accurate knowledge of what their costs are, generally take work at the lowest possible figure, not infrequently at prices little more than the value of the lumber used. It is not reasonable to suppose that they would continue to accept orders which entail a loss if they knew definitely what their costs were.

There are many benefits to be derived from well-kept costs. From them we can see at a glance which departments are on a paying or losing basis. It shows us the profitable class of trade. It also indicates the employees that make money for us and those who do not. In short, a well-kept cost system will tell us almost anything we want to know concerning our business. A manufacturing operation conducted without a cost-keeping system is a speculation, but operated with one it becomes an investment. A ship cannot be navigated without compass and chart. Cost is the compass and chart of the woodworking industry.

These remarks are based on information gained from personal contact with costs as outlined above, and which I have operated during the past ten years, with improvements added from year to year.

Conditions in Furniture Industry

The officials of the Furniture Manufacturers' Association, who are touring the province, calling upon members of the industry, recently visited several Central Ontario points and met a number of furniture manufacturers on their own home grounds, so to speak. These calls are being made in the interest of the various activities of the association and also to gain a first-hand knowledge of conditions in all branches of this important industry.

Almost everywhere they went they were impressed by the spirit of optimism which was noticeable on the part of the different manufacturers on whom they had the pleasure of calling. "Business is improving," was the general response to the greeting, "How is business? It cannot be said that there is any marked improvement in demand, though it is slowly and surely gaining strength, nor has production been speeded up to any extent, but the fact that the retailers are exhibiting a tendency to buy, coupled with the fact that stocks in the hands of the dealers are well below normal, leads to the conclusion that there are better times just ahead for the furniture industry. In some cases it was found that there has been a slow but steady increase in the volume of orders coming in ever since July, while other manufacturers termed the demand spotty, but slowly gaining strength.

With regard to production, this stands to-day at about 55 per cent. of normal. There is this to be said, however, and that is that the stocks of finished furniture in the hands of the manufacturers are considerably lower than they were a few months ago.

The recent advance in lumber values, together with the higher prices which prevail on glass, point to an increase in furniture prices. It is probable that when the new lists go out early in January, many items will have been marked up rather than further reduced.

The two photos, which are shown on this page, were taken during one of the trips. The picture on the left shows J. H. Baetz, Kitchener; Wm. Cawkell, secretary of the Manufacturers' Association; Thos. Bell, of the Bell Furniture Co., Southampton, one of the pioneer furniture manufacturers, and at the age of 78 still actively engaged in producing furniture, and T. Lyle Blogg, manager of the Home Furnishings Bureau. The picture on the right shows Messrs. Baetz, Blogg and Cawkell and "Jake's" fine car.

Wins Cost Association Prize

Announcement was made to-day that the annual prize of the National Association of Cost Accountants had been awarded to Mr. R. L. Walls of the University of Chicago. This prize is awarded each year for a thesis on some practical cost subject. The competition is open to regularly enrolled students in schools offering instruction in cost accounting. There were approximately thirty entries this year, and the quality of the theses submitted was unusually high. The title of Mr. Wall's paper was "A Study of Manufacturing Expense Accounts." Other theses submitted were: "A Cost System for General Building Contractors"; "A Cost System for a Chain of Retail Lumber Yards"; "Cost Accounting for an Aircraft Industry"; "Methods of Accounting for Waste in a Cotton Spinning Mill"; "Service of Costs to Standardization," and "A Cost System for a Biscuit and Cracker Manufacturing Co."

Lewis E. Meyers Co., Valparaisa, Ind., have secured temporary premises in Woodstock, Ont., and will manufacture their line of portable desks for children. If the Canadian market proves attractive, company propose establishing a permanent Canadian plant of their own.

Officials of Furniture Manufacturers' Association who are Making a Tour of Ontario.

N. M. Currie, Manager, St. Mary's Wood Specialty Company

Quality of Product Ensures Market

Interesting Outline of the Activities of the St. Mary's Wood Specialty Co., St. Thomas, Ont.—Have Developed Special Automatic Equipment to Facilitate Production of Their Many Lines

In every particular line of manufacturing enterprise it is worth that tells, and the house that has the goods, and the company that makes them are the ones who are always sure of an extensive market. This is strikingly illustrated in the St. Mary's Wood Specialty Co., Limited, one of the important industries of St. Mary's, Ont. This industry was established in the year 1908. The plant is equipped for the manufacture of high-grade wood specialties, such as ice and field hockey sticks, ball bats, Indian clubs, etc. A special department is devoted to the production of high-grade pick, axe, sledge and small hammer handles, the quality of which, the makers declare, is unsurpassed in Canada. Canadians are a working people, although they dearly love athletics. Hockey is a great winter pastime and baseball the premier summer sport, but the axe, pick and sledge still hold sway over the hockey stick and the ball bat.

The casual reader may wonder what these observations have to do with the woodworking industry. Simply this, that while the plant of the St. Mary's Wood Specialty Co., Limited, has a capacity of 20,000 dozen hockey sticks a year, in the department of more utilitarian agencies of civilization and national expansion, such as axe, pick, sledge and hammer handles, the industry has facilities for double this output. This may be interpreted that Canadians are still toilers, much as they love recreation and diversion.

Special Equipment Developed

The factory of the St. Mary's Wood Specialty Co. is modern in every respect, and, notwithstanding the present depression, is running in all departments, although, of course, not as fully as last year, when no less than twelve carloads of hockey sticks were shipped to all parts of the Dominion and many states of the Union, particularly in the North.

The head of the concern to-day is N. M. Currie, through whose initiative and energy the industry has largely been built up to its present proportions. Mr. Currie is the inventor of several time and labor-saving machines, which have greatly increased production and reduced overhead expenses. "This is the age of invention," he declared. "Hand methods are too slow and costly. We now have the largest factory in Canada for the manufacture of hockey sticks, and we believe that our equipment is unsurpassed."

The trade mark of the firm, with crossed hockey sticks as a background and surmounted by a shield on which are the words "Quality and Service," is well known, and the slogan is "That which is worth doing at all, is worth doing well." The company makes a specialty of manufacturing hardwood handles and hockey sticks from the raw material as it grows in the forest to the finished article. The sticks made by the firm are manufactured chiefly of rock elm, which grows in scattered stands throughout the district surrounding St. Mary's. The pick, axe and sledge handles are turned out of hickory, maple and white ash, while all smaller handles are made of hickory. The rock elm is brought to the company's sawmill on flat cars or hauled in by farmers during the winter months. Many portable and small sawmills cut exclusively for the firm, who have been able to obtain enough rock elm to meet all their demands. Sawing the logs is generally begun in February or early March in the company's own mill, and they are cut up on the circular saw to widths of three and a quarter inches. It is found that during the early, cool spring months the wood seasons much better and more rapidly than when the hot weather arrives. The time required for proper seasoning is from four to five months.

How Hockey Sticks Are Turned Out

The logs, which run from 20 to 24 inches in diameter, are piled on tram cars, which are drawn by a cable up to the saw carriage. After being adjusted on the carriage, which is hand-set and operated by a cable release, the logs are sawn in the thickness desired. The standard widths, as well as the slabs, travel over live rolls back to a butting saw, where the material is cut to length and placed on an elevator, which carries it to a track connecting the sawmill with the factory.

The material is cut into billets or blanks and piled to season for three or four months. The next process in production is reducing the billets to proper size for operation through the bending machines. Before being bent they are put into a steam retort at thirty-five pounds pressure and left there for about half an hour. Next the billets are placed in either single or double bending machines, a zinc shoe being affixed at one end of the billet, which is bent to form the blade required for hockey sticks. This process is most interesting, and to see the rock elm curling up at one end or both without breaking, by means of steam pressure, affords some idea of the strength and fibre of this hardy forest product.

The wood is next seasoned until quite dry and then

the bent billets are run through automatic ripping machines, which cut the strips to the required thickness and tapers them. After this they are marked out to the various forms desired. The stock then goes through a band saw and is cut to the various shapes described by the forms. The old system of employing drum sanders for finishing has been abandoned and new, improved, automatic machines for doing this work at much saving of time and expense have been substituted. These special machines also improve the shape of the handles by keeping them straight. The automatic machines first properly bevel the blades and next the finishing and sanding, all in one operation. They are so simple in construction and easy of manipulation that two boys can do the work which it formerly required several men to execute.

Hockey sticks are turned out in eight different grades, including those of the short shape handle used for playing field hockey. The process of grading is carried out by means of a rack with sections corresponding to each of the qualities. The sticks are then taken to the labeling room, when they are tied up in bundles, six sticks to a bundle, and are subsequently crated in standard crates, six dozen handles to each crate.

A quantity of material not suitable for making hockey sticks or large enough for the general lines of the company, including slabs of rock elm and maple, are cut to the length necessary for making axe and pick handles. This material is run through the billeting machines and the portions large enough for converting into handles, are cut to the proper dimension. The offal is used for fuel for the boilers of the company.

Dimension Stock for Handles

The imported and domestic hickory for the regulation handles is cut to dimensions in the various mills from which it is obtained, and the product shipped in in car lots and stored in proper rooms until it is worked up into the finished article. When used this stick is elevated by conveyors to the second storey of the factory, where the machinery for turning out all straight handles is located. There is another conveyor for irregular shaped handle stock, which is run into the storeroom by gravity carriers, where it is piled until needed.

The first process in making straight handles is in putting the stock through a double equalizing machine which cuts it into uniform length, after which it passes through either one of two large lathes, which have been set for any of the lines made in pick, sledge or small handles. The blanks then drop through a chute to the ground floor and are placed on trucks and taken to the sanding belts and passed through the different grades of coarse and fine sanding until they are in a condition to be waxed, after which they are put on trucks and elevated to the second floor, where they are labeled and crated.

The irregular stock, such as axe handles, is stored in a different section from the straight stock. The billets are marked out to the several desired shapes by means of forms of special design. The irregular shapes are next cut out on hand saws, after which they are passed through automatic lathes and finishing machines in much the same way that the regular straight lines are produced.

Power for the company's sawmill is furnished by a 100 h.p. engine, while the motive equipment of the woodworking plant consist of a 75 h.p. steam engine and two motors of 20 h.p. each.

Good Wages and Free Labor

It was pointed out recently by Governor Ephraim F. Morgan of West Virgina, in a statement in the New York Commercial, that 40% of the bituminous coal produced in this country is from mines where non-union labor is employed. He says, in speaking of the leaders of the United Mine Workers: Under the present wage scale they have found it an impossibility to lessen the tonnage from the non-union districts." After a long course of rioting and murder which received countenance or apology from the national leaders, developing into an armed insurrection which only the United States Army could suppress, these mine leaders discovered more than the governor ascribes to them, or at least would have found it if they possessed an intelligent sense of proportion.

They themselves had stimulated the non-union production by the encouragement of loafing, costly labor conditions and excessive wage demands among union workers. The per capita production of the non-union miner is far greater than that of the unionized worker. His labor conditions are eminently tolerable, his net wages are as good or better, and he has practically continuous work against fewer days a week in the unionized districts. When will labor begin to understand that a union is a means and not an end? If the workman can secure better conditions in the open shops of the United States Steel Corporation, is it any wonder that 93% of that corporation's employees were not in sympathy with the indefensible strike of two years ago? To judge from the utterances of some labor apologists, and more particularly those who carry their half-baked economics into the pulpit, a strike is something good for its own sake and a union is an end in itself. Everybody is looking around for signs of better times. The non-unionized miner is one of them, and he is getting big wages at that.—Barron's Weekly

Retail Stocks Are Depleted

Stocks of general merchandise probably never were lower than they are to-day. Merchants and dealers everywhere began cutting down stocks because of necessity about a year ago and have been at it ever since. Nobody cares to place orders for future requirements because of the feeling that the price trend is downward. One result is that New York, Chicago and other centres are swarming with out-of-town buyers who need goods in a hurry. "Buy little and buy often," is the current slogan. Production, consequently, has been drastically curtailed in many directions. There is at least a possibility that the universal lightness of stocks on shelves, combined with under-production, will one day—and that perhaps before long—bring a complete change in the price trend. As a mater of fact, the consumption of merchandise in this country has not decreased so very much, if any. Let something happen to transform sentiment from pessimism to optimism, and lively times are likely to develop.—Forbes.

How One Saw Was Made to Cut

Operator Surprised When Suggestion Was Made to Remove Large Number of Teeth — Successful Operation Depends Upon Proper Spacing of Teeth

By W. J. BLACKMUR

I went into a friend's factory the other day, and found that he was having trouble with his saw. True, it was a one-horse show, one might say of even less power than that, still, in spite of it being of trifling importance, the trouble to him was, indeed, very real. He had bought an electric motor and a small saw bench which took an 18 in. saw. The saw in the bench was 13 in. and he was trying to cut some 4 in. fir with it. He was cutting it, but at the cost of a large expenditure for electrical energy, and a considerable tax upon his patience. I do not know which was the most expensive. He wanted to cut a four-foot, 4 x 11 in. plank into ½ in. x 4 in. strips. No great task about that. It is often done in the manual classes, and it should not have proved so difficult to my friend.

I asked him what was the trouble. The first trouble was that the belt would run off the pulley. The next was the amount of power the saw took, and the slow way it cut. "I cannot understand it at all. I chose the saw because it had so many teeth in it, and my cousin, who is a blacksmith, told me tha tthe faster I ran the saw the quicker it would cut. You try the saw." I did so. It was just humming round somewhere between four and five thousand revolutions per minute. It just whizzed. "It is going some," I said. "Yes, there is no doubt about that. I was determined that it should not be for want of teeth or the speed of teeth that the saw should not cut." "So it seems," I said. "Stop the saw and let me see the teeth." He threw the belt on to the loose pulley. Then I saw that the saw was five teth to the inch. Five teeth to the inch used for ripping purposes. "If that saw and that speed does not make for fast cutting, I wonder what will," he said. "You are not reasoning on logical propositions," I answered. "As a matter of fact, and of practice, you have made the conditions so it is very difficult for that saw to cut. Why, you won't allow the teeth to get a bite in the wood before you move it out. The teeth have no chance to cut. Why, there I will show you," and I put the belt again on to the tight pulley.

Knock Out Nine Teeth

"The saw is moving so fast that it is impossible for the teeth to get a bite out of the wood. If you intend to run this saw at this speed, then knock out nine teeth and leave one. There will be less for you to shapen." "Why you must be daft to imagine just such a thing." "Nothing of the sort. Let me say that if I do not make any improvement in the saw by knomking out those teeth, I will buy you a new one similar to this. I ask nothing in return, only I want a fair chance for a saw. You are not giving it to this one." "You will spoil it. Why it stands to reason that the more teeth you have in a saw, the more or rather the better it will cut." "That is only a rumor. It is not a fact. Come bring me a chisel and a hammer and I will turn dentist." With considerable reluctance these tools were given me.

Judging from the look on my friend's face, he ought to have had chloroform while I did the surgical operation on that saw. It was soon done, and the saw was minus a great many teeth, which lay on the mill floor. Every two inches was a slight projection. This was the odd tooth which had been left in to do the work of ten teeth.

"You don't suppose thath saw will cut now," said my friend very anxiously. "I don't suppose anything at all about the matter. I know that those points two inches apart will do better service than the odd ten teeth, which stood there before I cut them out of the saw. It would be best to put in proper gullets, but even before we do this, I want to show you that you were making a great mistake in your reasoning. There were so many teet that it was impossible for the saw to really cut. Those teeth could not cut because there were too many teeth. Sounds like a paradox, yet it is thes imple truth."

I put the saw in. It did not look like one, just a circular disc of steel with a few points showing every two inches.

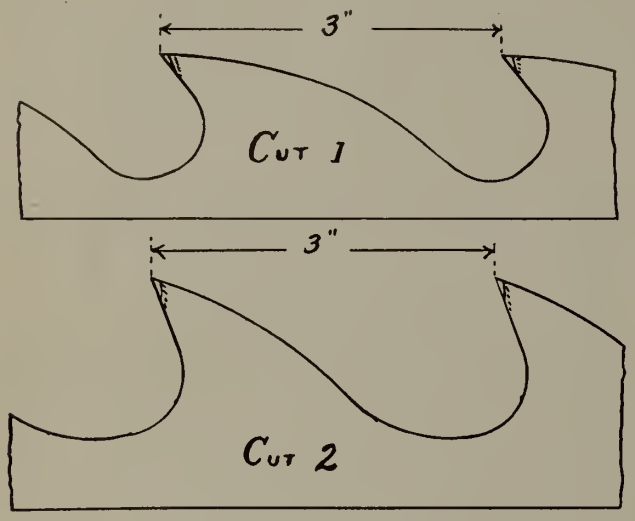
Must Take Hold of Wood

You pull the saw back, I suppose, when you put it in with the pin on the top. This keeps the saw in the same position every time you put it in or out. No little item, I can assure you, if you want the saw to do first-rate work." I fastened up the nut, then let the saw run. It still whizzed, indeed, it seemed to whiz more, judging from the sound. My friend picked up cut and looked with amazement at the way the saw cut the wood. Before he had to push quite hard. Now the saw cut it quite freely as though it was fond of the job and had no objection to what it was doing.

"I cannot understand it," he said. "Why, it was such a difficult matter to make that saw cut. Now it will go through the wood quite easily." "It will be better yet. Even now the saw is not cutting at its best. At the speed you are running I should have put in teeth every three inches and have given it a gullet so fast that not one had a chance to cut."
a saw. There were so many teeth in it and they moved it was a steel disc you were pushing against instead of which would take all the wood such a tooth would make. However, I did not want to alarm you, so I just knocked out the teet hso it left 2 in. teeth. What is needed is a tooth which will take hold of the wood in front of it and remove it all the time it is going through the wood. Your fine tooth saw did not have that opportunity. It just took out the smallest of fragments, then there was no more work for it to do. Why it seemed when you were working it as though the part of the 4 in. x 11 in. piece which had not been

There is another item with the teeth that wonts altering. If you remember those teeth were upright and the tops went down to the bottom of the gullet. Now I should alter the front of the teeth. The average man imagines that if the tooth has a sharp point to it, it must cut. It is a mistaken idea. It is not a sharp point that is needed, but a sharp edge. A point is

obtained by filing or grinding a tooth, so it has a bevel on the front and one on the top of the tooth. This is excellent if you simply want to stick those points into the wood, but you want to do other things than that. You want to remove a piece of wood the width of the saw. This can be only done by making a chisel tooth, not by making the teeth so they are a series of revolving points. If you want a saw to cut very easily, and every man who works a saw wants that, you must make the teeth like a series of chisels if you want them to cut easily. Each tooth must take ont its part of the wood and work all the time it is in it. It can only do that by having the teeth arranged according to the speed of the saw. If, for instance, you ran the saw at twice its present speed, it is now exceeding its proper limits for a 2 in. tooth; then, instead of increasing its power for cutting, it would lessen rather than increase it. It would be necessary to have the teeth 4 in. apart to give good results. The faster the speed, the wider



High backs consume power.

must be the teeth space, so each tooth can do its maximum amount of work. It is also important that the rake or the front of the tooth should be an acute angle. It does not matter so much about the top o fthe tooth, providing, of course, that it has the proper clearance.

Keep Backs Down

Only a short time ago in the "Canadian Woodworker" a writer derided the idea of having acute angles for the front of the teeth, and claimed that when he ground down the backs of his teeth and altered the rake in front to a less acute angle, he saved a great deal of power. Luckily he sent two rubbings of the teeth before and after. The first set was of the teeth before it was touched by theg rinding machine; the second was after he had ground back the front and ground down the teeth of those saws.

One would imagine after definite statements like these, that there was a great deal in what he said. It was against all my experience, and I looked very carefully to see the nigger in the wood-pile. I was not long in discovering that dusky individual. He was lurking right in front. I took a straight edge and laid it along the tops of the teeth. It will be remembered the drawing was taken from a rubbing of those teeth. The straight edge showed that the backs of the teeth were level with the front. One or two teeth seemed higher at the back than at the front. It meant that the saw had a good deal of unnecessary friction put on it when it was sawing. I could see that quite easily, and while his statement was correct that the altered grinding of tops and backs of the teeth made a considerable difference in the power, it showed that he had reasoned on false premises. If that writer had just altered the tops of those teeth instead of the fronts and tops, he would have increased the usefulness of that saw.

For circulars more than band saws or gang saws, it is very important that the teeth should be chisel shaped. They should go into the wood and take it out, not as so many teeth do simply rub off a small fragment, then pass along the wood because there is no more wood to cut.

Hold First Annual Meeting

The Association of Wood Using Industries held its first annual meeting in Chicago on September 26th. According to the reports presented, the association is comprised of eighteen different units, dealing with many branches of the woodworking industry and representing some six thousand individual manufacturers.

In outlining what has been accomplished during the first year of its existence, the president of the organization, E. E. Parsonage of Moline, Ill., claims that the association of Wood Using Industries has more than justified its existence. Work has been undertaken along a number of lines which may form a basis, not only for a national reforestation policy, but also for legislation and a plan of co-operation between the purchaser and consumer of wood products.

Through the efforts of W. A. Babbitt, secretary of the National Association of Wood Turners, the handle manufacturers of the States have simplified and standardized their wood requirements. The standardized sizes have been adopted by the National Hardwood Lumber Manufacturers' Association, with the result that any sawmill operator is quite safe in working up his low-grade material into standard dimension stock at the same time be assured of a market.

The following officers were elected for the ensuing year: President, E. E. Parsonage; vice-president, H. P. Baker; treasurer, F. A. Vogel; secretary, Wm. B. Baker; executive committee, the above officials, together with W. A. Babbitt, John Foley and W. H. Davis.

Is Pessimism Overdone?

It may be true that everybody is hard up, but there is a lot of evidence to the contrary. Travel records this summer compare favorably with those of any boom year. The better summer resorts are crowded. People are turned away every day from the highest priced hotels in New York. There is a scramble at every meal for seats in the most expensive restaurants. The amount of betting on horse racing is said to be eclipsing anything ever known before. Merchants report that the demand is chiefly for the better grade of goods, although it is true that many customers now shop around until they find attractive prices. Until the very warm weather set in theatres were crowded nightly. Automobile makers have been reporting active business. Savings bank deposits have been breaking all records. Every first-class cabin on boats bound for Europe is engaged. May it not be that most of us are not really so very badly off as we have become fond of proclaimng?—Forbes.

Enemies Without and Enemies Within

Box Industry Suffering from Competition Among Wood Box Makers — This is One Line Where Cut Prices Do Not Create New Business—A Plea for Better Conditions Among Individual Manufacturers

By B. F. MASTERS
Chairman National Association of Box Manufacturers, Address before Convention at Atlantic City.

There is an old saying that there is strength in numbers. I feel to-day that there is strength in representation, territorial representation. When I see a represensation here from the West and from the East and from the Central States, I feel that you are actuated by some real purpose, that you have come here because you have an interest in the industry which you represent. Therefore, I shall take but little of your time. First of all, silence is golden. Secondly, it is economy because every word I say to you is taken down here and will cost something to record in the official minutes of the Association, and anyhow, you didn't come here to hear me or anybody else talk, except to gather the facts pertinent to our industry. When I say "our," I think we all have a common purpose in mind and that is the improvement, as far as possible, of the situation that surrounds the industry in which we are all engaged.

I am not much interested in discussing with you the past because that is an open book, and in some respects the less said about it the better. I am not able to discuss with you to any great extent the future, because I have no knowledge with respect to the future that you gentlemen don't possess. I have no means of determining the future, except by the past, and only in so far as it affects the future, I take it, are we very much concerned in the past. We are dealing with facts as they exist to-day. We are living in the present and we are manufacturing boxes in the present, and I take it, most of us are selling them in the present, though some of us may be making future sales. I doubt that, however, and the things we are most interested in are the real, live, pertinent issues of to-day that surround our industry.

Take an Optimistic View

We are all interested in forecasting the future as far as possible, and in so far as we are all able to see, I believe, judging from those with whom I have conversed, that we are all rather optimistic. I am as much of an optimist as the general nature of business conditions will justify, perhaps a little more than I can justify in my own mind, but it seems to me that we are all approaching the situation to-day with a feeling of optimism and with the belief, I am sure, with the hope and possibly with the belief that we have passed through the worst of the depression that has been forced upon us in the last year.

The general business situation as far as I can forecast it, seems to indicate that we are all a little better off than we were a few months ago and that the situation is therefore more hopeful. The Government reports of crops indicate that we are going to have a splendid crop, taking al the agricultural products of the country combined—perhaps not quite so great as last year, but yet sufficient to justify and encourage us in the belief that good times o rbetter times are ahead of us.

In our own industry I have always maintained that that our box situation and box business was somewhat a barometer of general trade conditions and that you can't sell our product because times are good or because times are bad except as there is a demand for the thing that we have to offer for sale. People don't buy the product that you gentlemen manufacture unless they have something back of that which demands that particular thing in which to ship the products of the various factories and mills and industries of the country to whom you look for your trade. Therefore, you are perhaps a more direct barometer of industrial conditions that many other industries that are more remotely related to the business situation as it may exist in a particular time.

I take it that having come here from all directions from the East and from the West, you have come here for a purpose—of informing yourselves as to the business situation and as to the conditions surounding your trade and your industry, and anything I may say to you will, of necessity, have to be borne out by the facts that develop but I hope that while we are here we may devote ourselves to the objects we had in mind when this meting was called—that is, to discuss fuly and freely and frankly the fundamental and underlying conditions of our industry and try to acumulate and disseminate as much information as posible with reference to our particular industry, and I hope that we don't absent ourselves from the room until we feel that we have acomplished that thing, till it's over with.

I read a little story this morning about the Englishman who walked down a certain street in Boston and saw a sign out over a cafe or restaurant that said, "Beefsteak." He walked in and seated himself at a table and said to the young lady who came to take his order, "I believe I will have some beefsteak."

She came back in a moment and said, being Boston, "The beefsteak is over."

And being English, he said, "Over what?"

And true to her traditions, she said, "Over with."

Now, I hope we may devote our time and attention to the business here until it is "over with" and that we may have the attendance and attention of every man that is registered here.

Competition From Within Industry

I haven't anything to say about the future because, as I have said before, I know of no way of judging it but by the past and judging by the past I can't offer you any great encouragement, but my conclusion is that in the every-day course of our business affairs the one great thing that we are mostly interested in is the question of the price of our product. I take it that you are all more interested in that than you are in the volume of your sales because you can't create a market for your product beyond the demand that is occasioned by the business condition of other interests, but you can have some voice in the price at which you sell your product and I am forced to this conclusion in talking

with gentlemen here and in my observations far and wide, that the prices that prevail to-day for the commodities that you gentlemen manufacture might be largely improved and largely controlled by your own efforts, that your competition and the regulation of your prices comes from within this industry and not from without.

Reflection of General Economic Conditions

We have said a great deal in the last several months, in the last year or two, with reference to liquidation and with reference to the conditions that are forced upon us on acount of the world war through which we passed many months ago, but which still leaves its impress upon our minds and upon the conditions of trade in general. If this were a situation that the United States alone were concerned in, I do not think we would have had the measure of depression that has been forced upon us, but the condition that obtains in the United States and in our country obtains throughout the entire civilized world and if you will stop to think that these conditions obtain in a great measure and to a greater extent in European countries than they do with us, you will more easily understand the diffculty that we in the United States have in regulating our affairs to the conditions that were brought about as a result of the late war.

Fundamentally our demand depends somewhat on the requirements of our export trade and with the conditions fixed upon European countries by virtue of the peace adjustment, we are confronted with the condition of having to meet prices that are forced upon us in the manufacture of many articles that are exported from European countries to the United States, and since our labor leaders, whether union leaders or otherwise, have triad to impress labor with the necessity of maintaining the high wages that prevailed during war times, we have been forced to meet the condition that is almost impossible in that labor has studiously demanded the same measure of compensation that it did during war times when labor was scarce and when prices were high and we find that condition existing in union labor to-day—that they are reluctant to in any extent meet the depressing conditions that surround our manufacturing interests and those of us that have to deal with union labor find that condition very much more acute than those of you who are located in sections where union labor does not control or dominate.

Taking Other Fellows Business

But as I have said in the beginning, this competition and this matter of making low prices and trying to underbid our competitor all comes from within our own industry, not from without to any great extent. That seems to me to be occasioned by a desire on the part of so many manufacturers to keep their business on a little higher plane than that of their competitor, a reluctance on the part of the manufacturer to assnme his full share of responsibility for the depression of business and to operate his plant upon the basis of the general demand for the product which he manufactures.

As we used to say, we used to put it that "some of us feel we have some advantage over our competitor and that we can go out and build our trade up and spread our overhead over a greater amount of business and therefore reduce our costs without ever giving a thought to the condition that surrounds the man whose trade we take."

I don't think there is any business in the United States for boxes or shooks that somebody, at some time, has not supplied and that somebody doesn't now claim as being their trade, and whenever any man in this room or any man in the industry, whether in this room or not, thinks that he can surround himself with a better condition by going out and taking that trade at a low price in order to spread his overhead over a great amount of business, he is injuring the industry just to that extent that he is taking trade away from somebody else, which forces them out either to take additional trade to substitute for that or meeting the price that the other man has quoted, and my observation has been this (and it has been brought home to me directly) that where we have (I am speaking personally now) where my company has reduced a price to hold trade that it has enjoyed for years, I have been accused of being a price-cutter and accused of making ridiculously low prices and selling my goods at less than cost, and I have done it. Why? Because I have tried to hold the trade that I have supplied for years and years, and which I feel that I have developed and have as much a right to as anybody else.

Tendency Is Ever Downward

Is there a man in this room who hasn't experienced the same thing? This is the thought I want to get before you, that when you go out to build up your business by taking trade from somebody else, you are doing a thing that is fundamentally injurious to the industry in which we are engaged, and, as I have observed and conversed with men in this industry, I find that the general tendency is amongst those who do not keep in close touch with us and who try to build up their trade from that which you have built up and accumulated and served for years, because they don't get the business they conclude that their prices are not low enough.

I heard a man say in a box meeting within the last 30 days, "Well, I have quoted prices below cost and yet my price is not low enough. I have quoted on a half dozen diffesnt trades, quoted below cost because I wanted business, and I didn't get the business." And I happened to know that man and I happened to know some of the trade that he quoted on, and in every instance he had tried to take some trade that he had never enjoyed before, and he had quoted a ridiculously low price in the hope of getting it, but the man who had it felt the necessity for keeping it so strongly that rather than lose it he took it at a loss, and in the mind of this man, whom I first described, you who quoted that price to hold your trade stood condemned of being a price cutter because you quoted and sold your trade below cost.

It seems to me an ethical conclusion that in depressions of this sort every man ought to be satisfied to serve the trade that he has been serving in times of prosperity through which we have passed—not so long ago that we may not still remember those days of prosperity when we had all the business we could serve and when we had trade that bought from us because we gave them service and not because we made the very lowest price that a man could possibly make, and if we will get away from the idea that low prices gets business and realize that service counts for something, then we have taken a step that will redound to the credit of our industry and also to our individual benefit and advantage.

Machinery & Equipment

Light Straight-Edging Saw

The Canada Machinery Corporation of Galt, Ont., recently placed a number of new saws on the market. One of these is their No. 613, light ripping and jointing saw. This is patterned after their well-known No. 611 straight edging and jointing saw, only being lighter in construction and embodying a number of refinements suggested by their experience with the heavier machine.

Some of the features of this new saw are divided chain, convenient control levers, large rigid bearings, saw held firmly between large collars, positive straight-lined feed, special shavings hood and special attention to safety features.

With a saw of this type it is possible to rip stock so accurately that it can be glued without any further correction. When a special joint, such as a V or tongued and grooved joint, is required, only the smallest shaving need be removed, enabling the stock to be

C. M. C. light, straight edging saw.

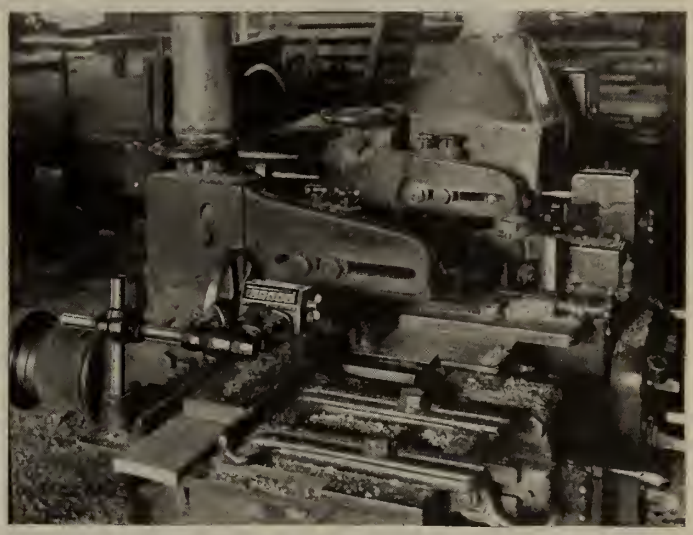
routed nearer to the finished size and thus making for a saving in material.

This lighter machine should satisfy the demand for a straight edging saw for plants which do not have sufficient heavy ripping to warrant the installation of the larger machine.

Lumber Meter Reduces Costs

Standardization is the topic of conversation among those interested in the woodworking industry to-day. It has been referred to as the foundation stone to modern manufacture. This refers not only to standard products and sizes, but also to certain standards on which to figure costs, job estimates, etc. These standards, while proven necessary to successful business, will be controlled largely by the efficiency of your equipment, your labor and your knowledge of your working conditions. There must be greater and cheaper production and a thorough and reliable record of costs when production standards have been established.

The lumber meter as shown in the accompanying illustration has done much toward speeding up production and cutting down costs. It has in many plants, as in the plant in which this photograph was taken.



Showing Durant Productimeter attached to sticker.

furnished records on which large savings have been effected. This meter is applicable to moulders, matchers, stickers, flooring machines and self feed rip saws, and can be used on either end of the machine.

It records automatically each foot of material going through the machine, thus furnishing figures, which are accessible at all times, of the daily or hourly production. From these figures it is easily determined which operators and machines are turning out the most and which the least. Over runs and under runs can be entirely eliminated by watching these figures, thus effecting a large saving of waste material and expensive set ups. It is usually considered indispensable after being used and its worth demonstrated.

Belt Sander With Large Capacity

The new Oliver No. 126 belt sander, as manufactured by the Oliver Machinery Co., Grand Rapids, Mich., is shown in the accompanying illustration. This is a general purpose machine designed for sanding and polishing various kinds of work, including line and edge mouldings.

One interesting feature is its range or capacity, for it is so constructed that it can accommodate work as high as 54 inches on the table, and work up to 72 inches from the floor plate. For this reason it can handle cedar chests, phonograph cabinets, desks and medium-sized pieces of furniture of various kinds, the table rolls on ball bearings, making it extremely light to operate. It has a travel of 36 inches, enabling the

machine to work to the centre of the 72-inch surface. The tension of the belt may be changed to suit the various classes of work.

The top, which is 32 x 96 inches, is constructed of stripe of wood with sufficient space between to permit of dust and slivers to fall through. An adjustable bar holds the work on the tables. The idler is adjustable

Special sander with unusual range.

vertically and may also be set in a tilting position so as to keep the belt running on the centre of the pulleys. These pulleys are wide enough to handle belts up to 14 inches in width.

An edging attachment is provided to attach to power stand arms. It consists of a belt plate adjustable table which can be tilted to 45 degrees up or down, as well as having a vertical movement. It also has an attachment for sanding form edge mouldings or irregular shapes.

The machine is equipped with roller bearing countershaft or may be arranged for motor drive. A special sanding pad attachment is optional.

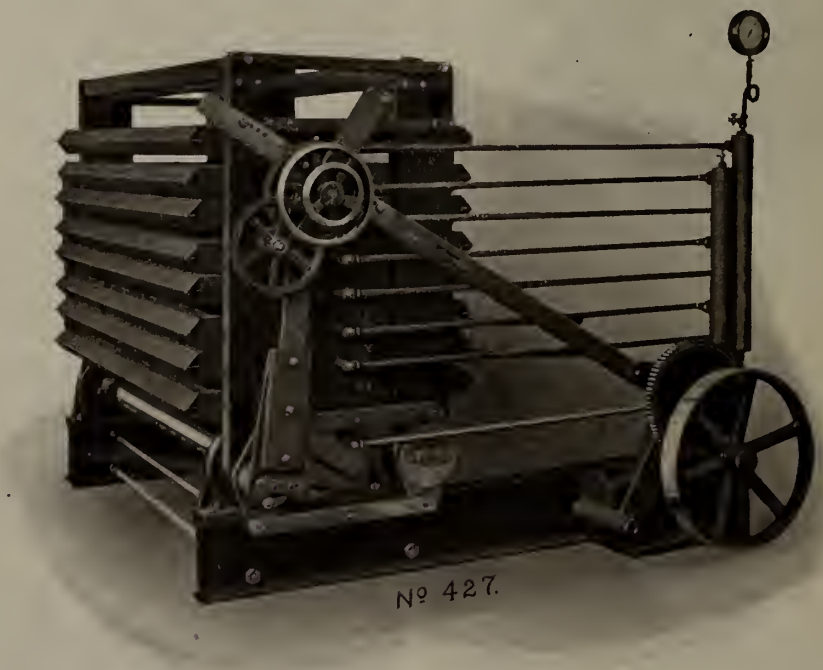
Merritt Veneer Re-drier

What is known as the "Merit Balanced Plate Veneer Re-drier" as manufactured by the Merritt Engineering & Sales Co., Lockport, N.Y., is shown in the accompanying illustration. In principle the veneer is dried between the hot plates which move up and down and alternately press and release the veneer. Owing to the fact that a certain amount of pressure is applied, the stock is straightened and at the same time the moisture is removed. Releasing the pressure momentarily also gives the stock an opportunity to shrink and thus prevents the formation of checks. If the stock were to be held securely and rigidly while drying, it stands to reason that as shrinkage takes place, something must give, with the result that checks appear in profusion over the surface.

In this machine a truck with rockers and posts balances two parallel frames which support the horizontal plates in two distinct series. In an 8-plate machine, for instance, with plates numbered from bottom up, the odd-numbered plates, 1, 3, 5, 7 are connected together and move as a single unit, while the even-numbered plates, 2, 4, 6 and 8, move as another separate and distinct unit. A movement downward of one series is made by a corresponding upward movemnt of the other series until contact between the plates is made in pairs, while spaces open betwen the other pairs. When the machine is reversed, contacts and open spaces change. This opening and closing is known as a "breathing movement."

This machine is made in various sizes to take veneers 60 x 56, 72 x 36, 84 x 54, 100 x 52 and 100 x 78. The number of plates vary, the standards being 8, 12 and 16. It may be had for either motor or belt drive.

There are several ways of dispensing with the loose pulley; one is to drive direct with an electric motor.



Balanced plate redrier for handling veneers.

Upholstering and Trimming

Modern Upholstering

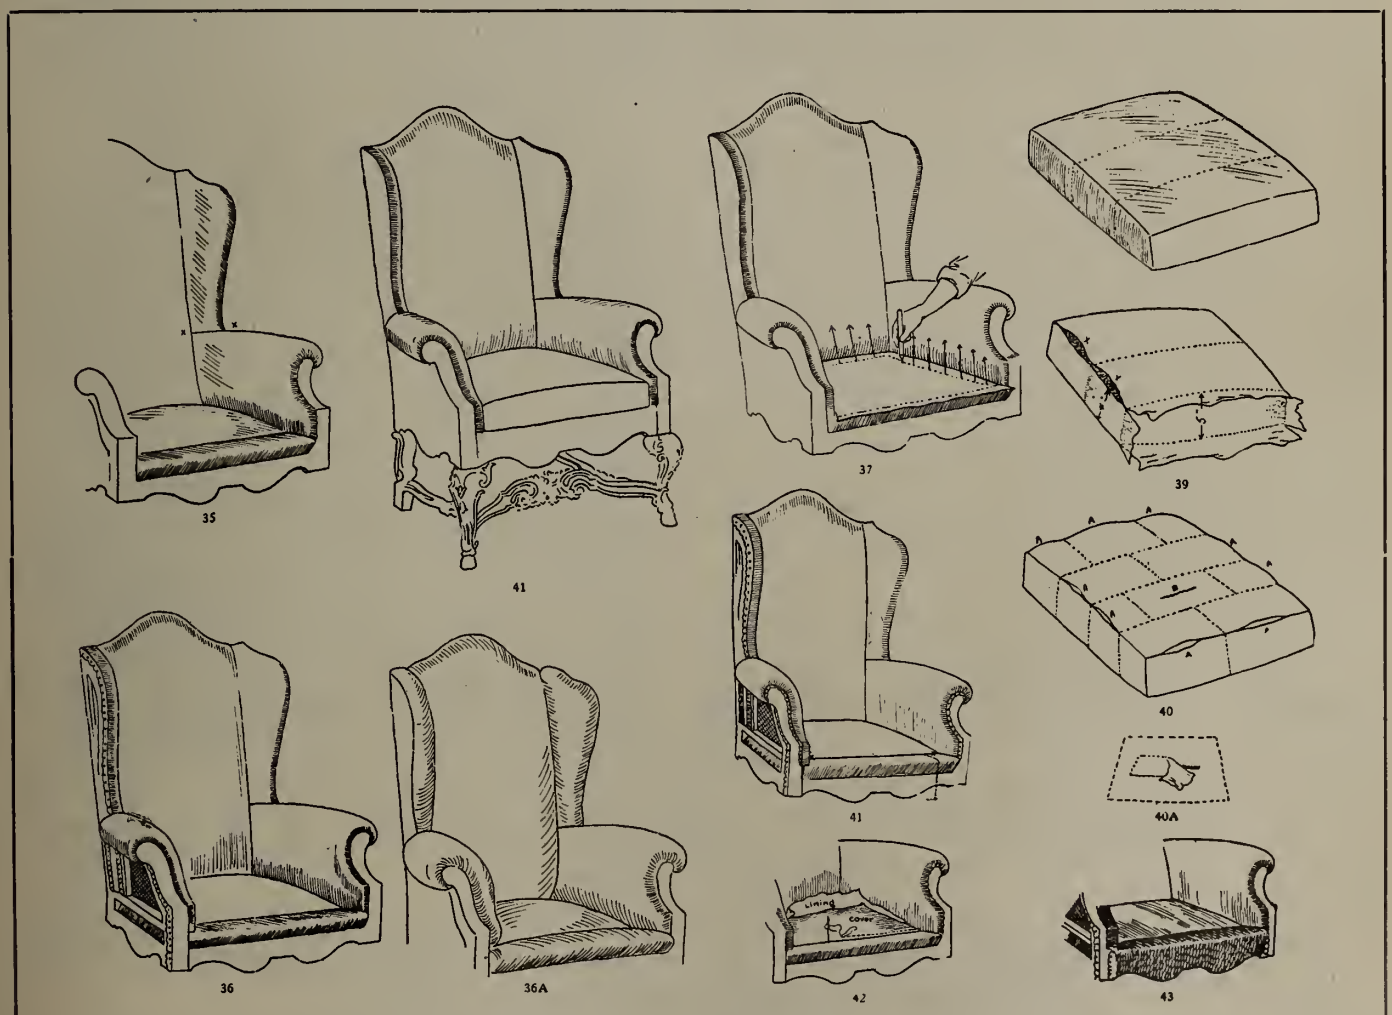
Lacing on the Hair — How Down Cushion is Made —Testing Quality of Material.

The next operation is the lacing on of the hair, as already shown, Fig. 34, and finally the covering with muslin to the stage illustrated in Fig. 35. Where the muslin of the wing joins the muslin of the arm, it will be necessary to sew the two together on the line xx, as shown in Fig. 35. On the completion of the covering also, it will be found necessary to have the material seamed at this point in order to provide the proper shape.

With both arms and both wings covered in muslin, the chair will now have the appearance indicated in Fig. 36. Just her it is well to point out the possibility of losing the symmetrical lines of the chair by upholstering that is too full or that rounds out over the edges of the frame. This possibility is indicated in Fig. 36a, where all of the sharp symmetrical lines of the chair have been lost, and bulbous, pillow-like outlines have been created. In this illustration the arms are too full, the front seat nosing too round, and the back and wings have lost the shapeliness which is characteristic of the original frame.

The chair is now completely upholstered in muslin, the outside arms and wings having been lined with muslin for display purposes, and the only upholstering yet remaining to complete the muslin stage is the making of the down cushion.

It used to be customary on chairs of this description to allow a recess at the bottom of the inside arms and at the bottom of the back for the down cushion to slip into. This is not, tolay, considered a good practice, but the arms and the back are finished straight down and the down cushion is made to fit into the



Successive steps for finishing seat and preparing cushion.

space between the arms. Therefore, a paper is smoothly laid over the seat, and with a pencil, held upright as indicated by the arrows in Fig. 37, an outline of the cushion is marked on the paper, and from this pattern the cushion is made the exact size thus indicated.

Down cushions are not, like buttoned cushions, made larger than the finished cushion is intended to be. On the contrary, they are made the exact size of the pattern with only seaming allowances added beyond the lines indicated in Fig. 37.

The filled cushion, as shown in Fig. 38, must exactly fill the space allowed for it, so that it will lie in place without being crowded, yet at the same time fill the seat without leaving any unsightly gaps or openings. Because of the nature of the down-filling material, it is necessary to divide the inside of the cushion by partitions which prevent the down from shifting its position when in use.

A cushion of the size indicated for the chair we are describing would have not less than two partitions are indicated by the dotted lines in Fig. 38, also in Fig. 39, which shows one end left open to more clearly show the location of the partitions.

These partitions, furthermore, are made on an average of one inch wider than the box edge of the cushion. Thus, in Fig. 39, the edge shows a depth of four inches, while the interior partitions have a depth of five inches. These partitions are sewn to the top and bottom of the case, but are not sewn to the edges. These divisions are filled, as indicated in Fig. 39, by leaving an opening at one edge of the boxing (see xx), through which the down may be inserted, they are then pinned together and sewn.

Larger cushions call for a greater number of divisions. These divisions, as in the case of the cushion shown in Fig. 40, must each be built separately. This cushion has partitions running in both directions, across and lengthwise of the cushion, as indicated by the dotted lines. It sometimes occurs, as it does in the case herewith illustrated, that it is not possible to fill all of the sections from the edges. The cushion shown in Fig. 40 has ten divisions, nine of which can be filled from the edges at the openings marked aa, etc. The tenth division, however, is an interior division and this can only be filled by a slit made at b, which is sewn together and after the filling covered by what in trade parlance is known as "a plaster," consisting of a piece of the same material as that of which the casing is composed placed over the seam and sewn all around, as indicated in Rig. 40a.

With regard to the material used as a casing for down filling, the finest down-proof sateen or ticking only should be employed, and a simple test of any material may be made by determining the degree to which it resists an attempt to blow through it. If, by holding the material across the mouth so that no air can escape around it, and then, by blowing, force the pressure of your breath against it, real down-proof material will be found to be practically airtight. If the breath passees through it easily to an extent that would extinguish the blaze of a candle, it is a safe assumption that the material is not down-proof and should not be employed for casing purposes.

With the cushion completed and in place, the chair in muslin ready for covering will now have the appearance shown in Fig. 41. If the chair is to be displayed for sale, however, the fronts of the arms would have a panel of muslin sewn on and tacked around the edge of the arms as a finish and the entire outside of the chair would also be covered in muslin.

These final details serve to present a better appearance when shown for sale, but the muslin linings require to be removed in the final covering of the chair, which will be described in a later chapter.

The previous paragraphs have carried the upholstering of this chair up to the point where it would be shown for sale, in the muslin, and subsequently covered. On the assumption that it would not be shown for sale in the muslin, the upholstering would stop when it reaches the stage shown in Fig. 41, which is practically the same as Fig. 36, except that the face of the arm is covered in the last mentioned diagram.

The first operation in the covering is, naturally, the seat. It is not customary to cover the entire seat with the furniture covering, but only that part which is likely to show under the edge of the cushion. For this reason, therefore, a piece of covering, wide enough to reach from the line x—x to the edge of the nosing and down to a point below the scallop, as indicated by the dotted line in Fig. 41, is sewn to a piece of lining large enough to cover the seat, and after being sewn together the two are stitched from the wrong side of the covering, as shown in Fig. 42, and eventually tacked into place as indicated in Fig. 43.

The back, arms and wings are also covered in the regular way. The chair has now reached the stage where it must be determined how it is to be trimmed, a matter which will be discussed in the next instalment.

(Continued in November issue.)

Why Tacks are Numbered

The question is often asked why tack manufacturers changed from the old system of marking tacks, 2 oz., 3 oz., 10 oz., etc., to a form which gives only the number as No. 2, No. 3, No. 10, etc. By some people it has been regarded as a move, on the part of the manufacturers, to decrease the number of tacks per box, as the old system represented the number of ounces per thousand of tacks; and some thought that the tacks, themselves, were different under the new system of marking.

The explanation for the change is best given in a communication we recently received from Samuel Salmond & Son: "We were obliged to change our method of marking tacks to conform with the law requiring all package goods to be marked according to their net weight. In old times, tacks were marked 1 M—2 oz., and this package, instead of containing 1,000 tacks, contained two ounces, and the number of tacks in the package was about 800. Now we have changed our packing so that we pack all of our tacks by net weight, and mark them either in ⅛, ¼, ½, 1, 5, 25, 50, 100 pounds, and specify the size by number. These numbers correspond in size with the old designations by ounces, and the tacks are exactly the same as they were heretofore."

Inasmuch as tacks are sold by weight, the present system of marking actual weight rather than a figure, which suggests a variable quantity, seems to be perfectly fair.

The foreman who gives his employer and his men a square deal is helping to solve labor troubles.

Can You Define Velvet or Velour?

Confusion Exists with Regard to Such Names as Velvet, Velour and Plush—Some Differences Outlined

In the upholstery trade there is no one question that is more frequently discussed than, "What is the difference between a velours, velvet and plush." In trade we regard a velvet as smooth finished, low pile fabric, and a velours as of a little higher pile, and a plush higher still, but technical writers make little reference to velours.

The manufacturers of upholstery materials almost invariably call their products as velvet or velours, the term "plush" being applied to the material made for the cloak and suit trade. It is a singular fact that this same thing that the manufacturers call velours, the railway purchasing agents call plush. Literally, velours is the French for velvet.

There is great confusion in the use of the terms, velvet, velours and plush. We talk about utrecht velvets, but if made in this country they would be called velours. An authority for a New England manufacturer claims that they only make velvets and plush, although most of their product is sold in the trade as velours.

Another manufacturer says there is no difference between velvet and velours. And yet the United States government draws a distinct line, claiming that velours are made with one warp and two fillings while velvets are made with two warps and one filling. Here is a distinction that is not generally admissible, but it is a distinction that finds place in the administration of our tariff laws.

Pile fabrics are distinguished from all other woven articles by their surface, which shows a series of short threads projecting from the body of the cloth and usually concealing the interlacing of the ground warp and filling. Irrespective of the particular method of construction, these fabrics are known as "cut" or "loop" (uncut) piles, according as the loops have been cut or left as woven.

Technically, pile rabrics are divided according to method of construction into two main classes: (1) Filling piles, which are made with one warp and two fillings, producing velveteen, fustian, corduroy and velours, and (2), warp piles, which are made with two warps and one filling, producing velvet, plush, astrakhan cloth, etc.

Silk pile fabrics are mainly of the warp pile class, various kinds of velvets and plushes; and as a rule, only the pile of the fabric is of silk, while the ground warp and weft is of cotton.

Plush is constructed in a manner similar to that for velvet, but the pile is usually longer and less dense. In the U. S. tariff law of 1909 an attempt was made to differentiate between the two as follows:

"The distinction between plushes and velvets shall be determined by the length of the pile; those having pile exceeding one-seventh of an inch in length to be taken as plushes; those having pile one-seventh of an inch or less in length shall be taken as velvets. The distance from the end of the pile to the bottom of the first binding pick shall be considered as the length of the pile."

Velvets and plushes are woven as double-pile fabrics, i. e., two cloths are woven at the same time, one above the other, connected by the alternate interlacing of the pile-warp threads. A knife reaching from side to side of the loom cuts the pile halfway between the two cloths and leaves each with its own half of the pile. In Europe, velvets are sometimes woven over wires, but this necessitates very slow production. This method is occasionally used to make uncut velvet, but is more largely employed in making brocaded velvets for upholstery and for rich opera cloaks; in the latter case the wires are furnished with knife edges that cut pile loops, according to the jacquard design, as they are withdrawn. If a velvet shows cut-pile figuring with satin-woven ground, it is always a cut wire velvet; but American manufacturers obtain brocaded and other effects in a cheaper way after the cloth is woven.

In some cases the design is cut out in the pile by machinery that cuts close down to the ground; in other cases the design is produced by burning out, by means of suitable acids on the raised portions of rollers working on the back of the cloth, the binding of certain sections of the silk pile that are then brushed off the face. Another effect, sometimes used in making silk as well as mohair car-seat plush figuring, is obtained by stiffening terry woven pile, using heavy presses to stamp down the design, and then running through a shearing machine; when finished the pattern appears in loop pile and the ground in cut pile of the same height.

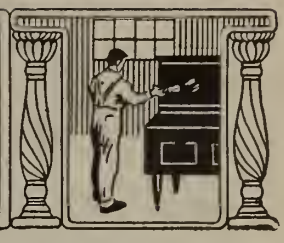
THE FINISHING ROOM



Getting Results from Varnish Sprayer

Cause and Remedy for Pitted Surface—Regulating Air Pressure—Should Varnish be Warmed?

By ARTHUR DEAN

Several years' experience in investigating troubles with varnish finish arising from application by the spray method, using equipment of various makes, has brought to light several common errors that are frequently at the bottom of unsatisfactory results. In the hope that an outline of these, and some suggestions on spraying technique in general, will be of value, these comments are written.

One common and a very serious trouble occurs with sprayed varnish, which is frequently called pitting and which develops as a kind of separation on the work, in which the varnish forms a lot of very small rings. An investigation usually shows this to be caused by oil or water in the pressure line. I have found that a careful examination of the defective work after drying will almost always indicate whether the trouble is caused by oil or water. If the rings seem to have a small speck in the centre it is a sign of oil, and this can be verified by rubbing down some of the work. If rubbing shows the varnish around the rings to be soft and imperfectly dried, it shows oil. When the trouble is due to moisture it does not seem to cause any difference in the drying.

Excelsior in Auxiliary Tank

The remedy is to locate and remove the cause, which can be done by investigating along the following lines. The compressor air tank should be drained daily, and particularly in the morning, by opening the drain cock before starting the compressor. Leave the pet cock open for a few minutes, and when oil and water are thoroughly drained, close it, and when pressure is up, open the separator or moisture trap on the spray booth and drain this also. Take care not to overload compressor with oil. It is always advisable to place the compressor lower than spray booth, so that a natural back drain toward the compressor will exist. If oil and water still give trouble after above suggestions have been carefully followed, would recommend the installation of a reserve air tank of 10 to 20 gal. capacity, located as near as possible to spray booth, same to be packed full with loose excelsior. The inlet and outlet pipes should be so placed that the air current must pass through the full length of the tank, preferably from bottom to top. This will reduce the velocity of flow of the air and furnish an effective medium for absorbing and condensing all suspended water, oil or dust that get past the other separating devices. This auxiliary tank should be emptied and repacked with fresh excelsior every thirty days, or more frequently when experience shows it necessary.

If pitting still persists, make a test by spraying a coat of varnish on a clean, dry glass plate, and if the film under these conditions shows pits, the varnish itself is likely at fault and a new lot or drum should be used. I have yet to see the first case, however, of pitting due to defective varnish as supplied by the established and reputable varnish houses. Occasionally a barrel of varnish is stored in a damp place or located where water from steam pipes or cold water pipes drips on it and finally penetrates through a leaky bung or partially-closed spigot, to the contents, causing a pitted finish. Such varnish can usually be put into good condition by careful heating, whereby moisture is driven out.

May be Other Causes

Should varnish film sprayed on glass dry O.K. and free from pit marks, the cause of the trouble can be looked for in the stain or filler, the condition of the veneer, or some other defective feature of the woodwork, in which case no amount of adjustment to the spray equipment will remove it. Another most important requisite to good work is the proper adjustment of the nozzle and the air pressure to the type of material being applied through the gun. Heavy-bodied varnishes (those with higher viscosity) in general will be found to require a higher air pressure than those of a thinner consistency. Heavy materials, as wood filler and iron filler, can be sprayed best with low air pressure (30 to 40 lbs). High pressures seem to blow the material off the work to be coated. It has been my experience that the use of the air agitator should be avoided in spraying pigment goods that are finely ground and will remain in suspension without it. This avoids the tendency to cause separation of the material that may occur.

Water and oil stains can be sprayed at very low pressure by using a small nozzle on the gun, so that excess material is not discharged.

The standard cuts of shellac and substitute shellacs require to be reduced and can be made to work nicely at 60 lbs. pressure, and the use of a smaller nozzle than for varnish is advisable and the flow from the container cut down. Do not hold the gun too close to the work or flooding is apt to occur.

In spraying the wood lacquers or products of similar manufacture and qualities I have found the clear goods to spray well at higher pressures than the colored, and if the coating in either case shows pebbly or sets up before flowing smooth, the pressure should be reduced until it does flow out.

Special Varnish for Best Results

Varnishes that give good results when brushed can often be made to give good results by spraying, provided the proper adjustment of nozzle and pressure and reduction is found. It is better and safer, however, to put the question of getting the right varnish for spraying up to the old-established houses, who have made a study of the subject and who offer varnishes especially adapted for the spray. Varnishes applied by brush and spray will dry and harden the same, pro-

vided the same thickness of coat is obtained, but the sprayed work will set up a little faster than the brushed. A varnish that sets up rapidly and fails to flow out can usually be made to flow by raisng the air pressure. It is well to remember that when the varnish manufacturer is called on to supply a varnish that will flow under all conditions, the only methods open to him in doing so are to supply a slower-drying material or to use a slower-evaporating thinner, either of which increases flow by reducing the rate of set-up.

Always follow the grain of the wood with the air brush, and never zigzag over the work, for by so doing a most uneven coat is the result. Start at one end of the surface and go clear across. When the brush is held at such a distance from the work that it seems to be applying a 6 in. wide spray, it really is covering solid about 4 in. in the centre, 1 in. on each side being blended out. Therefore, to secure an even coat it is necessary to lap over an inch or so in the next stroke across. Do not hold the brush 2 o r3 ft. away from the across. Do not hold the brush 2 or 3 ft. away from the work and expect to get good results; the proper distance depends on the surface, but for case goods and large panels 12 to 18 in. is about correct. Air pressure for varnish and enamels will vary from 70 lbs. up. On chair work this can be reduced, and also the flow of material at same time. When spraying taple tops or flat work, always start from the edge nearest operator and work away, which prevents blowing air over the surface already coated and assists in the flow.

There has been much controversy over the use of the heater in respect to the varnish, and my experience has been that this is not necessary except when the finishing room and material are cold, and I never advocate heating the varnish in the summer. When cold varnish is brought into the finishing room it should be allowed to stand about twenty-four hours to become thoroughly warmed to room temperature before attempting to spray it. The room temperature should be kept at the right point for proper working and drying of the varnish—about 65 to 70 deg. F. On special work, such as typewriter parts, and even fenders, very successful results are secured by using heavy-bodied black goods that have to be sprayed at 100 to 150 deg. in order to get them through the gun, but this is seldom the case with clear varnish work of any kind.

It is unnecessary to drain the varnish hose and container every night; in fact, it is better not to drain it. Have a can of naptha or gasoline at the side of the booth, and when through for the day put the end of the nozzle in it. In the morning wipe off the brush and start to work. If the hose and container are drained, a skin of partly-dried varnish forms and causes no end of trouble with dirty and lousy work. On the other hand, if hose and container remain air-tight, which is the case when the nozzle is placed in the can, no skin forms and the varnish in hose is clean. If it is absolutely necessary to drain the line at night, it must be thoroughly cleaned out with naphtha immediately afterwards. I have seen a most aggravated case of dirty varnish on piano work which was due to the use of a rubber-lined material hose that was not carefully and thoroughly cleaned each day. The turpentine of the varnish gradually softened the rubber lining, causing small particles to break off into the varnish and get onto the work.

Last, but not least, remember it is the "man behind the gun" who does the work, and to accomplish good results he must be interested in it and have the right kind of inducements and conditions under which to operate. Praise good work and correct the bad.—"Veneers," Indianapolis.

The Origin of Polychrome

The demand for the new polychrome or Italian Renaissance finish has been much discussed in wood finishing circles.

The fluted columns of the Renaissance period, with their many turnings and carvings, were often painted in various colors, which the centuries of storms and sunshine have dimmed until they are visible to-day through ad usty film. This is the origin of polychrome, and it should be noted that the ideal dim and dusty effect can best be obtained on work that is ornamented with turnings and carvings.

There appears to be such a general desire on the part of the furniture trade to learn something about the polychrome finish that we are outlining a simple method for securing this finish for producing poly-polychrome or Italian Renaissance on walnut:

1. Sponge the wood and when dry sand smooth.
2. Apply a coat of stain and let dry.
3. Sand lightly.
4. Apply a coat of lacquer.
5. Sand lightly.
6. Apply a coat of rotten stone or paste.
7. Wipe off clean so the color will show in the pore.
8. Allow to stand a few hours, then coat with our lacquer.

If a dull brown color is desired in the pore, use rotten stone in place of paste. It can be used either by mixing it in water or by rubbing on dry and wiping off clean. Note that rotten stone can also be used by mixing it with paste wax and rubbing in the pore, producing a good effect.

It can be left in that condition, thongh some want more life to the finish. This can be imparted by applying French lacquer. This lacquer can be applied with a brush or cloth. We recommend a cloth as it produces a softer effect and leaves less on the surface. This method will also produce good results on oak, chestnut, gnm, etc.

Economy in Purchasing Materials

When the finish means so much to a piece of furniture, it increases its saleability, enhances its appearance and denotes its quality—it is surprising that any manufacturer of furniture will take a chance with inferior finishing material when the cost between a first-class finish and a cheap one is so small. This is especially true when the difference in cost is compared with the total cost of the completed article.

It is difficnlt to make any appreciable saving in the cost of finishing a piece of furniture, that is, as far as the quality and price of material is concerned for a saving might easily be made in labor handling or method of application, and any saving made at the expense of the material used mnst invariably affect the quality of the resultant finish.

The point is this that in purchasing finishing material quality, not price, should be the deciding factor. A well-finished article will bring more money, enhance the reputation of the manufacturer and build good-will for both maker and dealer.

Some Suggestions on Staining

Difference in Waters Cause Variation in Results—Cloth or Sponge not Equal to Brush—Comparing Strength and Color of Different Stains

Stains are generally known by designations coming from the nature of the solvents which carry the coloring matter. We have water stains, oil stains and spirit stains, accordingly as the stains are soluble in such solvents.

Care must be taken in preparing the solutions. Water is the most commonly used solvent and the composition of water differs greatly. Some water is extremely hard. Some water contains magnesium, other water may contain iron, most water has lime in it and various other things have a part in the composition of water. The strength of the iron or magnesium or the lime may have a big effect opon the penetration and durability of the stains. Cleanliness of the various utensils used to mix stains is also of keen importance as the foreign substances allowed to remain in such by neglect may cause a different reaction than that sought. Water should be boiled or reduced from steam. Glass and earthenware vessels are the ones most used and guard against foreign substances. Hot water usually is better than cold, a fact made known by the use of it in the household for the solution of soap.

When dissolving a stain powder, first make a paste of it with the solvent, and when the paste is thoroughly mixed add the remaining solvent. This especially applies to water powders, which are sometimes difficult to dissolve.

When it is found necessary to reduce any kind of a stain, put in the reducer slowly, agitating thoroughly the contents when doing so. By using this system of reducing it will guard against the settling out, or precipitation of some of the colors contained in the stain.

Quite often, after the stain is applied, the surface of the wood is dry in some places and wet in others, and the man doing this work is apt to think that too much stain is on the wood where the wet places appear, and will attempt to wipe off the surplus. This is a mistake and will resultin a light place.

The reason for the difference in drying is due to the unequal absorption by the wood and the wet places are represented by hard growths and small pores. If wiping is necessary, og over the entire surface while the stain is wet.

To apply stain, have the brush as full as possible with the liquid, and then apply freely and evenly, with a long, full sweep, and allow to dry naturally. If the result shown is too dark or too light, then have the stain changed accordingly.

It is quite a common practice, in some finishing rooms, when applying stain, to use a sponge or cloth. This is to be condemned on general principles, because it is not practical nor possible to apply stain as evenly as when a brush is used. A brush method is more economical, also, as less stain is used.

Unlike the spraying of stain, which produces the same effect until all the stain is used up, dipping will result in lack of uniformity unless care is exercised. The stain must be kept of uniform strength, so that the last piece dipped will be the same color as the first.

Dipping stain can be kept of uniform strength by keeping a standard sample of the original stain used in the dipping tank and also having on hand strong solutions of the various ingredients used in the stain. By drawing off a pint simple of the stain in the dipping tank and holding it to the light, comparing it with a sample of the original stain, or staining two pieces of wood any falling off in color can be noticed. Another test is to drop some of the stain on a clean blotter and notice it spread. The different colors will form circles, the stronger colors spreading out further than the weaker ones.

These rings in comparison with rings made by a sample of the original stain will tell which color or colors need renewing. To bring the stain back to its original color, the pint sample drawn off from the tank should be brought to the same color as the sample of the original stain with the stock solutions of the different components of the stain.

Dipping stains should usually be made a trifle stronger than those applied with a brush because dipping does not "work the stain in," the way brushing does. When the articles are to be wiped the dipping stain should be stranger than when they are not to be wiped or the immersion longer so that the final effect will be the desired shade. It is more essential to wipe hard wood than soft wood because hard wood does not absorb the stain so readily, sometimes leaving air cells or patches when the immersion is done quickly.

Linseed Oil has its best equivalent in "FLAXICON." Either in boiled or raw, is elastic, durable and waterproof. Working to the best advantage with colors ground in oil.

Nichols Varnish Drying Equipment

A complete unit of fan, motor, heaters, air compressor, with automatic temperature and humidity controls for the correct drying of all coatings on the finest pianos, talking machine cabinets, furniture, automobiles, etc. A new humidifying air washer, which eliminates all dust and dirt, does away with all spray heads and connecting piping.

Will triple the output of your finishing rooms; decrease the congestion in your factory; reduce investment of goods in process and improve working conditions for your employees.

Better finish, scientifically dried from the inside out.

We will analyze conditions in your plant and submit a proposition covering an equipment suitable for your requirements, whether it be for automobiles, talking machines, pianos, furniture or railroad cars.

We have exclusive authority to issue license to use the Grosvenor Process Patent in all territory East of the Mississippi, Ohio and Detroit Rivers in the United States and Canada, the only varnish drying process that simultaneously subjects the coatings to the action of moisture in excess of natural humidity.

We also manufacture the Nichols Lumber Dryers, Veneer Dryers and Hydraulic Pumps. It will pay you to address us for further particulars.

Increasing the Speed and Decreasing the Cost of Your Finishing Room Operation

How practical, how advantageous and how dependable DeVilbiss Spray-painting equipment is, has been demonstrated in finishing rooms of every size and line.

Not merely in dozens of finishing rooms, but in thousands of them. Not only where a few different kinds of articles are handled, but where every kind, size and grade of wood or metal product is finished. Not alone where varnishes, enamels or lacquers are used, but where every kind of liquid finishing material is applied.

DeVilbiss
Spray-painting System

offers a complete, adaptable and guaranteed service. The finishing operation is speeded up 4 or 5 times over hand-brushing. A perfect, uniform coating is applied on all jobs. Working conditions are made more healthful and safer. Operating and upkeep costs are reduced to the minimum.

With your consent, we'll gladly tell you whether and how the DeVilbiss System can be of service and profit to you.

The DeVilbiss Mfg. Co.
3718 Detroit Ave. ***Toledo, O., U.S.A.***

Paint your factory walls faster and better with the DeVilbiss Spray-painting portable equipment. Let us explain.

Cut Down Your Refinishing Expense

Revarnishing is an expensive, slow and unsatisfactory way to handle marred, scratched or damaged furniture. It takes days for drying and rubbing and requires an excessive amount of material and labor.

Refinishing is absolutely unnecessary. There is a way to avoid the grief, delay and expense resulting from injury to the varnish.

FREE BOOKLET

Ask for our Free Booklet, "How to Repair Damage to Varnished Surfaces." It will explain how to avoid revarnishing, how to fix any injury to any kind of finish quickly, easily and without waiting for varnish to dry. WRITE TODAY.

If you are too busy to write a letter pin this ad to your card or letterhead.

Veneer Product of Recognized Merit

Interesting Outline of Veneering Practices in Large Factory—Departures from Usual Procedure

By S. H. JOHNSTONE.

What others are doing or how others are getting results is always an interesting topic for an article. We are all interested in the methods in vogue in other plants and often we get a clearer insight into our own problems by giving a little thought and attention to the way in which our fellow-manufacturers have solved the problems and difficulties which confront us.

Probably no one deparment in a furniture or piano manufacturing plant presents so many problems and requires such constant supervision as the one in which the veneering is conducted. A little carelessness here, a little laxity and the accruing toll of checking, warping, blistering, loose veneers, etc., may run into a startling figure, especially if taken for a month or year. There is plenty of scope for improvement in the veneer equipment and methods as found in the average plant.

Have Earned High Reputation

The piano is generally looked upon as one of the highest developments of the woodworker's art. Just why this opinion should hold is hard to understand, suffice to say that when one is desirous of convincing some doubter as to the worth and permanency of veneer, the piano is usually used as an illustration and the older the piano the more forceful and unanswerable the argument. That being the case, a short description of the veneer department of one of the larger piano factories, touching briefly on the methods followed, may make interesting and instructive reading.

Probably one of the most notable features in this plant is the attention given to the core. Now what is considered most suitable for pianos should not be too good for fine furniture. In the plant we are describing, the cores must be practically perfect. Not good enough or passable good or even fairly good, but the best possible. This means that strict attention is given to selecting the stock for cores. It must be straight-grained, even-textured wood, free from knots, checks or any burls or cross-grained sections which might exhibit a tendency to curl. This does not mean that none but clear stock is purchased for core purposes, but by the time the material has been cut to length and the knots and other objectionable features eliminated, the remaining material represents a high grade of lumber. Right here is laid the foundation for the excellency of the product, for it is not practical to produce high-class veneered work unless the core is up to grade in every respect.

In the veneer department proper is to be found such machines as hot-plate redrier, veneer clipper, veneer jointer and veneer taping machine, all carefully arranged with regard to sequence of operation. This department adjoins the veneer storage room so that the raw material is right at hand. All veneer and rotary cut crossbanding is carefully redried in the hot-plate redrier before being jointed and taped. This not only ensures flat material, resulting in perfect joints, but makes certain that such stock is obsolutely dry before being laid.

In the glue room the equipment is arranged on a progressive production basis. Two glue spreaders are in operation, each served by a hydraulic press. From the presses extend two overhead carriers which pick up the loaded retaining clamps and deposit them near the specially constructed drying kiln. Here the pieces are unclamped, after standing until the glue has had an opportunity to set, and carefully piled on platforms, such as used with lift trucks. Every care is taken to see that the pieces are piled evenly and that each sticker is placed directly above the one below. This extra attention ensures that the material will leave the kiln true and flat.

Special Provision for Drying

The kiln itself is of the modern type, in which the temperature and humidity are under automatic control, while a strong circulation is secured by means of a blast fan. A temperature of 120 degrees is maintained with a humidity which will bring the moisture content of the stock down to about 5 per cent. While a careful check is kept of all stock coming out, drying schedules have been drawn up covering the different pieces going through. It has been found that these schedules may be relied upon, because conditions in the kiln are always the same, but as an added precaution, as stated above, a check is maintained on the moisture content of the output.

After the stock is removed from the kiln, the usual sizing operations are performed. Where some pieces have been edge-veneered, the edge stock is trimmed flush with the face on a shaper. Straight cutters are set flush with top or guide collar and adjusted to come about 3/16 inch above table. Another collar the same diameter as the guide collar, is placed near the top of the spindle. In trimming, the edge veneer, the stock is held flat against the two collars. The second bearing enables the operator to keep the pieces steady and at right angles to the bed. This is a quick and efficient way of doing this bothersome operation.

Sponge Before Final Sanding

Another departure from ordinary practice as understood in the furniture field is that after the stock has had a thorough preliminary sanding, it is sponged, to raise the grain, and then the sanding is completed on a group of belt sanders. This is far better than where the finisher is called upon to do a lot of heavy sanding after the stain has been applied. While this initial sponging may not eliminate the necessity of a certain amount of sanding in the finishing department, it will make a radical reduction in the time spent in the

phonograph factory where the mouldings for the tops are sponged before being finished on a belt sander.

The secrets of successful veneering, if there are any, are: Have the best possible foundation or core, use good materials and glues, pay strict attention to details and the control and elimination of moisture at all stages of the work. Moisture is at the root of fully 90 per cent. of the troubles encountered in veneering and must be combatted relentlessly and ceaselessly.

Development in Veneering Practice

To-day Attention Centered on Elimination of Moisture and Counteracting Its Effects — Special Care to Drying Before and After Laying

A. S. REDFERN

Probably no one phase of veneering has enjoyed a greater development during recent months than that referring to the elimination of moisture at various stages of the different operations. There is a reason for this and that is that moisture is responsible for more of such troubles as checking, warping, twisting, etc., than any other single factor. Naturally in view of this it is not any wonder that moisture has come in for special attention and that ways and means have been developed for combatting it at every step of the work. One other phase of the work that has been studied closely has to do with strains and stresses in wood. Through a rigid control of moisture and by building panels with opposing layers of similar texture and equal strength, it has been possible to cut down the loss and trouble from warping and cupping.

Practically all movement in veneered or built-up stock, whether warping or checking, occurs when it is either absorbing or giving off moisture. Thus moisture may be said to be, indirectly at least, the cause of the trouble. The word indirectly is used advisedly, for if there were no uneven strains in the various layers which go to make up the completed unit, there would be practically little, if any, tendency to warp, particularly so if the different layers were of the same wood or of wood which expands and shrinks an equal amount. Again, regardless of the strains or stress which may exist in the piece, very little movement will take place as long as the moisture content does not change, especially so if the stock is dry. In the latter event the wood fibre has set in whatever position it happened to be in when dried and will not move until the moisture content undergoes some change, preferably increases. If all panels and veneered work were to be dried to a uniform moisture content and then further manufactured or stored under constant or uniform conditions—conditions which correspond to the standard moisture content adopted—it is not likely that there would be any marked tendency to warp or move, neither would checks develop in succeeding operations.

The two most critical periods in veneering operations, that is as far as moisture is concerned, are immediately before the gluing operation and the subsequent drying operation. Not only must the core be thoroughly dry, but the veneer or cross-banding being applied, must not contain any moisture. Many manufacturers are under the impression that because they purchased dry veneers and cross-banding or becouse they store this material in a dry, warm place, they are not taking any chance in laying their work without paying any attention to the moisture content of the stock to be glued. This is a misguided policy, one fraught with danger. All veneer and cross-banding, particularly face veneers, should be dried immediately before laying. When done thoroughly this has a tendency to eliminate face checks, at least those that are caused by swelling and shrinking.

There are many ways of handling this phase of the work. Some have constructed special hot rooms in which the sock is placed for a certain period. Others have purchased and installed one of the modern types of special dry kilns in which both humidity and temperature are subject to automatic control. These do satisfactory work in every way and are being used on an ever-increasing scale. There is, however, one type of redrier which has been constructed specially for handling veneers and cross-banding. It is known as a hot-plate redrier. The principle is that the veneers are placed between hot plates which are brought together, straightening and drying the veneers at one time. The plates are so actuated that they come together and separate again in a breathing or bellows-like movement. When under pressure the stock is straightened and heated, then when the plates separate momentarily, the vapor formed has a chance to escape and the stock is given an opportunity to shrink. This alternate opening and closing goes on until the stock is dry. If the pressure were to be applied and kept on, the moisture would not be able to escape so readily, and as the stock would be held between two flat surfaces, shrinking would be resisted, with the result that checks would appear. The hot plate type of redrier is in operation in many plants and seems to be the logical equipment for this work.

Regardless of how the veneers and crossbanding may be dried, such stock must be dry at the time of laying. Another point worth mentioning is by having the pieces flat and straight, a better joint results than if cupped and buckled stock were being jointed.

In the gluing operation the pressure should be applied to the work as quickly as possible. By hastening this part of the work, the wood is not given much of an opportunity to swell and the subsequent shrinking, with its tendency to develop checks, is reduced. In the laying operations, speed is a prime requisite.

After the pressure has been released the pieces must be piled for drying. Care must be exercised in this phase of the work, for while it is seemingly unimportant, unless the stock is piled true and flat it will not be true and flat when dried. The humidity controlled type of kiln, referred to above, is an excellent piece of equipment for this work. If the humidity and temperature are under automatic control so much the better for the condition in the piles can be held constant and drying schedules drawn up which may be applied to different kinds of stock.

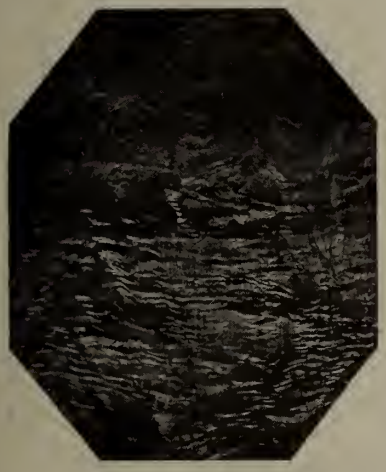
The Bachman Plant –and the Bachman Product



A sample of beautifully figured Walnut Stump Wood

Here, in this large and fully equipped plant, Bachman quality veneers are made. Our extensive yards are piled high with carefully selected, choice Indiana White Oak, Walnut and Gum.

Bachman veneers are cut full thickness, which means plenty of wood for sanding and a minimum of breakage in handling.

Bachman's forty years' experience in hardwood sawing is evidenced in every piece of veneer that leaves the plant. The sawed stock can scarcely be told from the sliced.

These are a few of the reasons why our customers tell us they get *fifty per cent. more panelling out of Bachman veneers* than they can from average veneers.

It is this unchanging high standard, both as regards materials and workmanship, that has made possible forty years of successful business. It is your assurance of the utmost in quality and service.

No order is too small to receive our prompt and careful attention—none too large to be handled to your entire satisfaction.

ALGOMA *the Better* Plywood

"Time will tell"

Your product, built of untested plywood, is "a house built on sand." For plywood is the very foundation of the service your product will give. And failure of the plywood in your product re-acts on your dealer and you.

Time has already given its verdict on Algoma Plywood. For 35 years it has been in use. Today it is being made with the skill and expert knowledge which only years of actual experience can bring.

Why not use the plywood which is uniformly dependable? It costs no more to build for the future as well as the present with Algoma, the Better Plywood. Let us give you the figures on Algoma stock sized panels, which save you money through standardized production. Whatever your needs in plywood, we can supply you.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

Plywood Manufacturers Meet

The Plywood Manufacturers' Association held a general meeting in Chicago on Septemebr 13th and 14th, at which a number of matters of vital interest to the industry were discussed. Thirty-five members were present.

A chart was presented, showing trend of business during the past two and a half years. The average sales per quarter for 1920 were 37 per cent. greater per plant than for 1919, while the first two quarters of 1921 averaged but 19 per cent. per plant of the total amount of business done during the same period in 1920. This gives an indication of the extent to which business has dropped, and reflects to a certain extent the conditions which existed in the furniture and building trades during the first six months of the present year.

The Plywood Glue Committee made an extended report of the new vegetable glue which is being put on the market, and pointed out its economy and all-round satisfaction.

The report of the Publicity Promotion Committee was of exceptional interest, and plans for the advertising campaign, which is to be conducted jointly with the National Association of Veneer and Panel Manufacturers, are about complete, and it is expected that active publicity work will be undertaken in the near future. The Mahogany Manufacturers and Importers' Association and the Walnut Manufacturers' Association have pledged their co-operation in this advertising movement.

Suggestions for Brazing Band Saws

While brazing band saw blades is a comparatively simple operation, there are some who experience considerable difficulty in securing uniformly satisfactory results. The following suggestions will, if followed carefully, assist in overcoming much of the trouble experienced in performing this operation:

First of all, the irons for heating should be as thick as the machine will allow—that is, the space or opening between the base and the pressure clamp. Then the irons need to have a good plane surface—actually they should be machined quite true on their faces—be free from burrs, twists or distortion, so that they shall have a perfectly true bearing on the saw joint. Further, the irons should always be brought to a very bright red heat, a mistake too often made being that the irons are insufficiently hot at the start of the job.

Then before placing the plates in the machine, or the saw between them, get an old rough, flat file and remove every particle of loose scale from the abutting faces, so that when they are clamped upon the saw blade they shall bear truly and intimately upon the joint, so as to ensure no possible chance of inaccuracy.

Leave the saw in the plates until the latter become black hot (not forgetting to relieve the tension in the saw by easing back thec lamping screws), then slacken off the cramps, take away the plates, and allow the saw to cool down.

Were these instructions followed out more closely than usually they are done, there would be fewer disclaimers to the superiority of plate brazing.

Safety first does not mean that the machine should be so covered that it is almost impossible for the man to work it.

Leather belting has its own peculiar advantages. Balata answers exceedingly well for most drives, but each and all are ruined if they have to transmit extra heavy loads.

One advantage with ball bearings is that they do not want tinkering with every few months to make the spindle run dead true.

When sharpening a wide panel planer it is advisable to use two kinds of stones; a coarse grade to bring the edge up quickly and a very fine grade to get a very keen edge.

MAINE BIRCH VENEERS

THE BEST IN THE WORLD

The Standard Veneer Co.

Hardwoods Made to Help Cut Your Manufacturing Cost

Your raw material is a big factor in woodworking costs. With your lumber and veneer it may have better texture and uniform color, saving in working and matching. It may be better cured by superior air drying (in lumber), or careful kiln drying with obvious saving. That is exactly the service we are pleased to offer you—a big organization built through thirty years' work around the factory man's needs. For instance, our twenty trained timber men carefully pick for uniform quality all the logs we cut; we have seven separate plants, each built to cut only a certain product, making uniform quality positive. Our lumber and veneer drying facilities are the result of rigid tests and exhaustive study and extensive enough for **any** demand.

As a result our lumber and veneer are recognized for their cost-cutting qualities. Have you tried them?

Plywood Advertising Campaign

In their search for material on which to prepare copy for the forthcoming $50,000 advertising campaign to be conducted in favor of veneers and plywood, those in charge of this campaign have left no stone unturned. They have succeeded in unearthing many fine old pieces of furniture built centuries ago which owe a goodly portion of their attractiveness and certainly owe their longevity to the fact that they were constructed of veneers. Among these pieces are numbered some of the priceless old heirlooms and antiques which have been handed down from generation to generation for centuries and which now repose in many of the noted public and private collections.

The study of thes fine old examples of the cabinet-maker's art has brought to light the fact that many of the old masters such as Sheraton, Shearer, Adam, Hepplewhite and others, used veneer on an extensive scale. As these pieces were produced at a time when quality was th greatest consideration, it cannot even be suggested that veneers were used in an endeavor to lower construction costs. More than that, these old masters realized that it cost more to complete a cabinet in veneers than had the same piece been made from solid wood. Sheraton has this to say wth regard to the use of veneers: "The ground, glue and extra time required for the vener work are more than equivalent to the extra high cost of fine woods in solid pieces." Another writer, commenting upon the use of veneering, says: "By the veneering principle alone can the burrs of walnut and mahogany and the curls of satinwood and other similar species be shown. The same is true of the burrs in amboyna and walnut. These twist and fracture in the solid piece and are lost. Veneers alone could have preserved these classic specimens."

One purpose of this campaign wil be to convince the general public that veneer or veneering is a fine art of the highest order and was recognized and practiced, not only by the master craftsmen of the English periods but by the old cabinet-makers of the Renaissance and French periods. As proof of this contention, they propose illustrating many of these old veneered pieces which have stood the test of time to such a remarkable degree.

It might be an interesting feature of a campaign of this kind, if it were possible to show side by side, say, 15th Century pieces in both veneered and solid wood. If that were possible, it is likely that the veneered pieces would be intact, while those constructed from the solid material would be found to be checked, warped and twisted so badly as to be rendered practically useless.

There are two strong arguments which may be used in favor of veneered products. One is as suggested above, the fact that in no other way can the beauty of some of the rare old burls be preserved and used on furniture, and the other is the fact that owing to the method of construction followed in building up veneered work, with its cross-banding and crossed grains, the veneered article is capable of resisting the tendency to check and warp which is so strongly exhibited by solid material.

Nor has the scientific side of veneering and veneered products been overlooked in favor of the historical. The material assembled for this campaign presents a most thorough and scientific treatment of the subject, together with a realization of the importance of extended research work as a basis for advertising propaganda of this character. This campaign should mean much in an educational way, not only for the manufacturers and users of veneers, but for the public in general in their appreciation of the product of this art in bringing their homes in line with the Better Furniture for Better Homes Movement.

Is Prosperity Just Ahead?

By M. WULPI

The situation business has passed through the past ten months is not to be wondered at, when it is realized that the war upset conditions of every kind, and carried its detrimental effect into every phase of human life and activity. The one big wonder is, that we seemingly are getting out from under it so rapidly. It took the country eight years to recover from the civil war, which was not nearly as far-reaching as the late one. The big commercial question at this time is, "What is this fall going to see?" Naturally, the buying activity and power of the farmer is as big a factor in the answer as any other. The 1921 crop is big. There are almost six and a half million American farms. Will they buy this fall, and to what extent?

A farm journal publishing house recently issued an inquiry to 12,824 farmer "Smiths" on its 1,100,000 subscription list, as a fair representation for general results. The question was: "What would they do with this harvests cash?" The returns were heavy. Computing the percentage in returns, the following deductions were made:

Of the total 1,100,000 farmers—
513,700 will paint this or next year.
42,900 will build houses this year.
38,500 will build next year.
40,700 are planning to build barns.
15,500 are planning to build houses and barns.
786,500 buildings to be built.
191,670 buildings repaired or remodeled.
862,000 farm building built, repaired or remodeled.
521,400 build or repair fences this fall.
95,800 build or repair fences next year.

11 5/10 of the Smiths will buy autos this fall, making 126,500 autos to be purchased by the 1,100,000 farmers, 137,000 already decided upon as to makes for this year and next.

They are to purchase 17,600 motor trucks this fall and 2,100 next year.
8,300 motorcycles this year.
68,500 will purchase lighting plants.
33,100 will install heat plants.
28,800 gas engines to be purchased.
78,100 washing machines.
120,300 musical instruments.
33,100 tractors.
100,000 implements.

$911,503,000 estimated total purchases by the 1,100,000 on this journal's list.

When it is considered that this is but one-sixth of the total farms and refers to only the main items, the total cash to be expended will run into cast sums from this medium alone.

How many other whcels will this put into motion? One industry interlocks into another, and if all move, what a tremendous machine it is. Let but a few cogs stop and the effect is far-reaching, and to the reverse, let one start off well, how many others it will drive.

Toronto Veneer Company Ltd.

(Operating Panels, Limited, Southampton, Ont.)

Office and Veneer Warehouse:
1100-1104 Queen St. West
Toronto

Lumber Yard:
Atlantic Ave. and G.T.R. tracks

Baseball Team of the North Americans, Bent Ceair Co., Limited, Champions Junior City League

N.A.B.C. Co. Team Wins Championship

The baseball team of the North American Bent Chair Co., Owen Sound, won the pennant of the Senior City Baseball League for 1921. Last year the team of the North American Furniture Co., Limited, took first honors.

As a reward for the showing made, the boys were given an outing in the shape of a tour of Manitoulin Island and north to Sault Ste. Marie. While on this trip a number of exhibition games were played at some of the stops. The party, which numbered about twenty, was chaperoned by John G. Hay, president of the North American Bent Chair Co., and Mrs. Hay. Gordon McIntosh, secretary-treasurer of the North Amerisan Bent Chair Company's club, and R. Fletcher, another official of the same organization, accompanied the boys.

The accompanying illustration shows the team, together with the officers of the club. The names of those comprising the group are as follows: Top row, left to right—Fletcher, C. Whinfield, Scott, Vasey, Wilson, Keeling, McIntosh. Second are, left to right—Patterson, Kinch, A. Whinfield, Rae, Garbutt, Foote, Hay. Bottom row, left to right—Greenaway, Robertson and Matchett. Insets show J. G. Hay, president, and James Garvie, secretary of the North American Bent Chair Co., Limited.

Special Furniture for House of Commons

The contracts for furniture for a number of rooms in the new Parliament Buildings at Ottawa, which were awarded recently, were divided between the following firms: H. Krug Furniture Co., Limited, Kitchener, Ont.; Preston Furniture Co., Limited, Preston, Ont.; Castle & Son, Montreal; Broomsgrove Guild of Canada, Limited, Montreal; Henry Morgan & Co., Limited, Montreal; J. A. Ogilvie, Limited, Montreal; F. E. Coombe Furniture Co., Kincardine, Ont.; Interior Hardwood Co., Kitchener, Ont.; R. A. Sproule & Son, Ottawa, and the Owen Sound Chair Co., Owen Sound, Ont. The main portion of the order went to the first three firms.

The furniture, which is being made from special designs prepared by the Government architect, is all in black walnut. It is to be of the highest class, the specifications being very strict, and calling for the maintenance of the furniture for twelve months after delivery. The total estimated value of the order is between $160,000 and $180,000.

The furniture consists principally of chairs, desks, couches, settees, tables, stands and racks, for the Governor-General's, Prime Minister's and Speaker of the Senate rooms; committee rooms, dining rooms, reading rooms, waiting and secretary's rooms. A very large number of chairs are required, including easy chairs and chairs with and without arms. Couches to the number of 150 are ordered for the members' rooms; tables in three designs for the Commons' reading room, eight desks for Ministers, a large number of tables for committee rooms, 15 square tables and 15 folding tables; extension tables and sideboards for private dining rooms, together with a quantity of settees, hat and coat stands, newspaper racks and screens.

Some of the furniture is of a specially high order. For instance, that for the Governor-General, Prime Minister and Speaker of the Senate. The furniture for the Governor-General's room will consist of two desks, a large cabinet, a Mace cabinet, six arm and eleven easy chalrs, and three sofas, whilst that for the Prime Minister's room will consist of two bookcases, two large tables, two side tables, two sofas, four easy chairs, twelve armchairs and twelve small chairs.

Stock of Veneers Partially Destroyed

Part of the stock of the Astoria Mahogany Co., Inc., Long Island City, N.Y., was recently destroyed by fire. The blaze did not reach the sawmill nor veneer manufacturing plant, but was confined to one of their several veneer warehouses. As a consequence only a small proportion of their veneerd stock was destroyed, probably not exceeding 3,000,000 feet of mahogany. Circassian walnut and other veneers. This will not interfere with their business in the least.

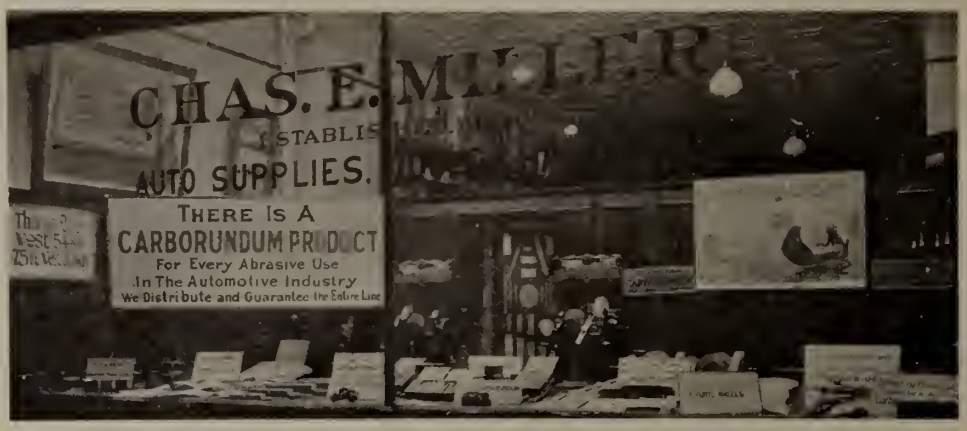
HAY & CO., Limited Woodstock, Ont.



A Variety of Carborundum Products

A very interesting display of Carborundum products is to be found in the window shown in the accompanying illustration. Practically all the articles on display are made from either this material or Aloxite, another abrasive of a similar nature. Both are products of the electric furnace and are admirably adapted for use as abrasives.

Carborundum is made from mixing such ordinary materials as coke, sand, sawdust and salt and fusing them together at the almost unbelievable heat of 6,000 degrees F. If memory serves the writer correctly, this is about the temperature of the surface of our sun as worked out and calculated by scientists. Whether that is correct or not, this is some heat. After being subjected to this intense heat for 36 hours, we find that these compounds have been fused into an extremely hard material which has been called carborundum. In hardness it rivals the diamond, being the second hardest substance known to man. It will be seen that as an abrasive material it should be difficult to equal.

Included among the articles shown are carborundum sharpening stones and grinding wheels, carborundum grinders, carborundum grinding powders and carborundum papers and cloths. All this display merely tends to indicate the wide diversity of Carborundum products and to give an outline of the wide number of uses to which this abrasive material has been put.

Conditions in Millwork Industry

A good idea of conditions in the millwork field may be gathered from the following letter which was sent in by the manager of one of the larger woodworking plants:

"There has been a decided improvement in the millwork industry during the past two months. Considerable building of medium class is in progress, creating a demand for sash, doors and interior trim. All work, however, has been thus far strenuously contended for and prevailing prices allow only a meagre, if any, margin of profit. This is deplorable in view of the fact that there is enough business available to keep all local plants moderately busy. There has been almost a frantic stampede to obtain business at any price, the natural result being that values are being forced to a very low level. When we consider that the lumber and millwork industry have already reduced prices far and away below any other branch of the building trade, one is led to wonder why the undue haste to sell near or below cost. The answer is, only a few of us know what our products are costing; the rest of us are simply guessing instead of intelligently and scientifically estimating. With these conditions improved, and armed with a knowledge of our costs, we would be in shape to handle the tremendous volume of business that is even now showing indications of an early arrival. Continue to preach the doctrine of "Cost Keeping" through the medium of your splendid journal. It will prevent many sash and door factories from closing their doors.

"If vendors of other commodities which go to make up the finished building, together with labor, adopt the same attitude as the millwork industry, the year 1922 will be without precedent."

Saw to Produce Excelsior Instead of Dust

According to a recent report, a company in the United States is considering bringing out a resaw for box makers that will produce excelsior instead of sawdust. This is in line with the widespread movement for greater utilization of wood waste. About the only way to make a saw produce anything resembling excelsior, appears to be, to have the material fed through on end so that the saw cuts lengthwise of the grain. No doubt some such arrangement is being incorporated in this new saw. Naturally a scheme of this kind has very narrow limitations, for it would not be practical to construct a saw that would cut long lengths of lumber, standing on end. Where some such scheme is applicable it should open up new source of revenue, for there is an almost universal demand for excelsior or wood wool.

Starting a Building Co-operative Scheme

A New York state furniture dealer has offered a plan to solve the building and unemployment problems. He proposed that twenty persons put up $100 each, starting it himself. Then the Chamber of Commerce was to put up a similar amount. Material, men and labor were invited to join. Those who put up the money took stock for the amount they gave. The proposal is that materal men should provide material, and take half cash, and the balance in stock of the company. It is further proposed that workmen should take half pay and the balance in stock in the company, which would own the buildings to be erected.

WHAT about your future hardwoods? It is obviously no time to preach Lumber "shortage" and we have no such porpose. But it is true that practically no lumber is being made and present shipments are slowly, but surely, wearing down stocks. It is only a question of time when there will be nothing left but a broken lot of low grade for there is no physical possibility of measurably increasing production for many months.

Now comes the easing of the cotton situation—releasing the money with which to carry present mill stocks. Our judgment is by no means infallible, but doesn't it look to you as though these circumstances would make it a logical time to buy at least a moderate stock? We have further information that would be of vital interest to any lumber buyer who will address us.

ANDERSON-TULLY COMPANY

MEMPHIS TENNESSEE

News of the Trade

G. R. Stevens has been appointed Canadian Trade Commissioner with headquarters in Jamaica.

English & Williams, Owen Sound, Ont., have opened up an upholstering and furniture repair shop.

The Standard Planing Mills, North Bay, Ont., contemplate installing a shingle mill. George Ingram is manager of this company.

The Pacific Color Mfg. Co., Limited, have secured a site at Chilliwack, B.C., and will erect a plant for manufacturing colors for paints, dyes, stains, etc.

An order has been placed with the Fort William Car & Foundry Co., Fort William, Ont. for repairing 1500 cars for the Canadian National Railways.

Jacob Malloy, of the firm of Malloy & Bryans, manufacturers of staves, headings, hoops and other cooperage stock, died recently at his home in Toronto.

The J. B. Watson Furniture Co., Limited, Kincardine, Ont., manufacturers of wicker furniture, contemplate erecting an addition to their factory.

The Western Lumber Retail Dealers' Association have voted $25,000. to be spent in an advertising campaign intended to stimulate building in various lines.

The Nelson Match Co., Limited, Nelson, B. C. recently placed an order for half a million feet of selected white pine, suitable for their product.

F. Huffman, formerly connected with the Badger Wood Products Co., Shawano, Wisconsin, has joined the staff of the Wood Turning Products, Limited, Deseronto, Ont.

The Canadian Gary Motor Truck Corporation, who are establishing a plant in Toronto, have decided to erect an assembling plant at Fort William from which to handle their Western Canada business.

Sorel Lock, Limited, Sorel, P.Q., have been incorporated to manufacture and deal in boats and launches of all kinds; capital $20,000. J. E. Pare and J. L. A. Deguise are two of the incorporators.

James Maxwell, president of Maxwell's Limited, St. Marys, Ont., manufacturers of agricultural implements, passed away at his home in that city. Mr. Maxwell was in his sixty-fourth year.

Major J. E. L. Streight, who formerly operated a planing mill and lumber yard at Islington, Ont., is the Liberal candidate for West York in the forthcoming federal election.

According to a report by J. E. Ray, Canadian Trade Commissioner, of Manchester, England, there is a good demand in Great Britain for toys in the shape of animals on wheels having a rigid iron frame and well-finished wheels.

The General Motors Corporation have decided to concentrate the manufacture of all its export models, with the exception of the Cadillac and General Motors Truck, at the Canadian plant of the corporation, known as "The General Motors, Limited," at Oshawa, Ont.

The Ottawa Stair Works, Limited, Ottawa, Ont., have been incorporated to manufacture and deal in woodwork of all kinds, and to take over as a going concern the partenership now known as the "Ottawa Stair Works." Capital $100,000.

Robert Stewart, Limited, Guelph, Ont., recently commenced work on a new planing mill and sash and door factory to replace the one which was destroyed by fire. The new factory will be two storeys, 110 feet by 152 feet, and of solid brick construction. In addition to the factory, they are erecting a dry kiln, office and large warehouse.

The Bissell-Irwin Lumber Co., Sherbrooks, P. Q., have taken over the lumber yard and woodworking plant of the Fletcher Corporation, Limited. In addition to the regular lines of building material, boxes, shooks and crates will be produced in the new plant.

The Board of Education of London, Ont., is investigating the cost and suitability of portable schools to take care of any overcrowding which may exist. The Board is also interested in prices on seating and other equipment for these temporary structures.

The British Columbia Export Club was recently formed with the object of developing British Columbia's overseas trade. The membership numbers about seventy-five, representing practically all the leading industries of Vancouver and the lower mainland.

Gordon C. Edwards, for many years manager and a director of the W. C. Edwards & Co., Limited, Ottawa, woodworkers and lumbermen, was recently elected to the Board of Directors of the Canada Cement Co., Limited, Montreal.

The McFarlane Mfg. Co., Limited, were recently granted a charter to manufacture and deal in woodenware and wood products; capital $100,000. This new organization will take over as a going concern the business now known as the McFarlane Mfg. Co.

Waltham Motors Corporation of Canada, with head office at 9 Wellington St. Toronto, have completed arrangements for taking over the plant of the Barrie Carriage Co., Barrie, Ont., where they propose manufacturing their line of trucks.

The Ingle Planing Mill, Lindsay, Ont., have branched out and are making a line of specialties in the shape of hall trees, floor lamps, paper stands and other pieces of a similar nature. They find that there is a strong demand for this new line.

The Tilt-Lok Steering Wheels, Limited, were recently incorporated to manufacture and deal in automobile parts and accessories; capital $200,000. John A. Campbell and H. E. Manning, barristers-at-law, Toronto, are given as two of the incorporators.

The E. W. Tickle Lumber Co., Liverpool, England, who deal largely in mahogany, report that the recent sales of this wood have been well attended and the bidding has been keen. At one of the latest sales held the prices were somewhat firmer than those which have been prevailing in that market.

The Sterling Woodworking Co., Limited, St. Lambert, P. Q., have been incorporated to carry on a general woodworking business, and to manufacture furniture, pianos and wooden articles of all kinds; capital $99,000. R. T. Stackhouse, K. C., and John McNaughton, both of Montreal, are among the prov-

The I. X. L. Mfg. Co., Harriston, Ont., have received a contract to manufacture 6000 car doors for the Paget Car Co-operative Co. of Buffalo. These doors will be used by U. S. railroads in carrying grain out of Buffalo. A staff of about forty men is busy on this order.

The Standard Dry Kiln Co. of Indianapolis, Ind., have recently issued a catalogue covering their line of kilns and equipment. Practical information is included on planning the layout of dry kilns and yards

Do you know what percentage of the selling price is represented by Labor Costs?

Labor enters largely into your production costs, and in order to establish a fair selling price for your product you must know exactly what these labor costs amount to.

Ask yourself the question again—"What percentage of the selling price is represented by labor costs?" It is too important to pass by lightly. If you are using accurate and unchangeable printed labor time records as obtained by the use of International Job Time Recorders, you can answer the question without any difficulty—you can even answer it on any finished product or portion of that finished product which is turned out by your factory. It is at your fingers' ends whenever you require it.

INTERNATIONAL TIME RECORDERS are as indispensable to the purchase and distribution of your Labor Time as the Board Measure is to the purchase of your raw material, or the sale of your product.

Let us send you full particulars about this money-saving system. Our advice is free!

LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd. WINNIPEG, 227 McDermott Ave. VANCOUVER, 230 Cambie St. SASKATOON, 254 Third Ave. S.

Also manufacturers of International Dayton Scales and International Electric Tabulators

and many suggestions for reducing handling costs in the lumber yard are given. The equipment described includes door carriers, lumber lifts, turn tables, trucks, transfer cars, steam traps, recording hermometers, hygrometers, testing apparatus and other similar instruments.

P. W. Gardiner & Son, Limited, Galt, Ont, manufacturers of doors and building material, are erecting an addition to their factory, 90 feet x 112 feet. This is to be used as a warehouse. They are also contemplating adding some new equipment to their sash and door factory some time next year.

The National Cooperage Co., Hastings, Ont., have taken over what is known as the Radiator building. It is the intention of this firm to construct and equip a sawmill, stave factory, dry kiln and storage plant. It is expected that employment will be given to from forty to fifty men in addition to a number of men in the bush.

R. E. Truax of Walkerton, Ont., was recently nominated by the Liberals of South Bruce to contest that riding in the forthcoming general electons. Mr. Truax, who is known as the proprietor of a busy sash and door factory and planing mill, recently celebrated his 74th birthday.

The ratepayers of Trenton, Ont. have passed a by-law granting a bonus of $25,000. together with free site and a fixed assessment to the Anglo-American Auto Co., Royal Bank Building, Toronto. This organization proposes to establish a $500,000. motor industry in Trenton.

C. B. Williams & Co., Limited, Toronto, Ont., were recently granted a charter to conduct a planing mill and to manufacture wood products of all kinds; capital $40,000. This new organization will supersede the C. B. Williams Co., who have conducted a general woodworking and retail lumber business in Toronto for many years.

The Massey-Harris Co. of Toronto, have decided to open a branch factory in Australia to take care of their Australian trade. This new move is due to the fact that the tariff recently imposed by the Australian government has practically closed the ports of the Commonwealth against agricultural implements other than those produced by local manufacturers.

According to the statement recently issued by Carriage Factories, Limited, Orillia, the past twelve months have been unusually trying. A deficit of $157,000. is recorded for their current year which ended July 31st. This is made up of an operating loss of $93,000. and a reduction in inventories of $55,000. Last year the deficit was $36,000.

The Canadian Founders & Metal Trades Association recently sent out a wage scale to their members with the suggestion that they apply it to their pay roll. Under this schedule wood pattern makers are to receive from 55 cents to 65 cents an hour, while carpenters are listed at from 45 to 55 cents per hour. Forty-eight hours to constitute a working week.

The National Cooperage Co., Windsor, Ont., who recently secured a site and buildings for the purpose of manufacturing cooperage lines, are installing some special automic machines, one of which is capable of turning out seven completed barrels a minute. This company plan to manufacture barrels and similar lines on a large scale and are establishing plants at a number of strategic points. The Welland plant is the third to be put in operation. The personnel of this company is as follows:- Mr. Lickley, president and W. J. Bragg, M.P.P., Bowmanville; Harry Buck, Norwood; Dr. Hess, Hastings, Ont. and B. J. McCormick, Welland, directors.

Wallace, Barnes & Co., Limited, a Canadian branch of the Wallace, Barnes & Co., Limited, Bristol, Conn., have taken over a plant in Hamilton, Ont., to manufacture screw machine products and springs of all kinds. This company is capitalized at $300.000. and will give employment to one hundred and fifty men.

The Garlock-Walker Machinery Co., Limited, Toronto, have moved their offices from 32 Front St., to 163 Dufferin St. This move should work out to the convenience of their many friends, for the offices and warehouse are now housed in the one building, enabling them to show prospective customers their complete stock of machinery and equipment.

The planing mill of Rankin & Co., Toronto, was recently damaged by fire to the extent of $20,000. Spontaneous combustion in shavings chute is given as the cause of the fire. The planing mill, which was of two-storey brick structure, was completely gutted while the excelsior plant was only slightly damaged. Johnson & Sons, Toronto, pattern makers, who occupied part of the same building, suffered a loss to machinery and stock of $10,000.

The Hoard Co., Port Alberni, B. C., was recently organized to manufacture silos of a new type. This silo is eight-sided and no bolts or iron bands are used in its construction, the planks being dovetailed into each other. The manufacturers claim that it will not be affected by swelling or shrinking. Equipment has been installed to manufacture 1500 silos per year. It is anticipated that the output will find a sale in Canada, Australia, New Zealand and the United States.

The Provincial Machine & Supply Co., Limited, St. Thomas, Ont., who have been manufacturing phonograph motors of different kinds, are now turning out a completed instrument. The cabinets are being constructed by the Green Lumber Co. of St. Thomas, while the metal parts are all manufactured in the plant of the Provincial Machine & Supply Co. It is stated this phonograph will compare favorably with any on the market both as regards appearance and tone quality. This new instrument will be marketed under the name of "Sonograph."

Cranbrook Sash & Door Co. have decided to rebuild their Cranbrook planing mill and sash and door factory, which was destroyed some years ago. Their plans call for a new building 60 x 110 feet, two storeys high, equipped with all the machines required for the production of a general line of building material and sash and doors. They recently acquired the Henderson sash and door plant at Golden, B. C., and are bringing the greater part of the equipment from this plant to Cranbrook for their newest factory. It is expected that employment will be given to between forty and fifty men as soon as the new plant is put in operation.

The business of the Veneer Manufacturers Co., 1036 West 36th St., Chicago, has been amalgamated with that of H. F. Arneman of the same city. By this merger Mr. Arneman becomes an officer of the Veneer Manufacturers Co. and will take an active part with Messrs. H. F. Walsh, S. J. Glanton and S. D. Rowe in the management of the business. Mr. Arneman brings to this company a wealth of experience in the veneer and plywood industry, which should be of service to the trade. In addition to plain and figured

One Reason why Kraetzer Cured Gum is Straight and Flat

Ask Your Factory Superintendents

You dont have to take our word for it ask your factory superintendent.

What? Why, how much stained or doty gum you are getting and what it is costing in waste, expense of removing and replacing unsound pieces put into work in the hope of "getting by" and minimizing waste, only to have it fail to pass inspection.

Do you know what stain is? It is what a headache is to you. A headache is only a warning of some derangement of one or other of the organs. Stain in lumber is only the visual evidence that decomposition has started within. How long did you suffer and "cuss" with headaches until you heeded the warning and had your eyes fitted with glasses?

Remember how beautiful the world became all at once

In just that manner, your worries cease and problems of production become simple when you heed Nature's warning and use GUM that is BRIGHT.

Of course, you can get Gum in this condition - at least, you can from us. We guarantee our KRAETZER-CURED Gum to be FLAT, STRAIGHT, and BRIGHT. Know it by the brand.

Your Protection

veneers, a large and well-selected stock of plywood panels will be carried in the Chicago warehouse.

The Rice Lake Canoe Co., Limited, Cobourg, Ont., has been authorized by supplementary letters patent to increase their capital from $100,000. to $150,000.

The Flexible Lacing Co., Chicago, manufacturers of the well-known Alligator Steel Belt Lacing, have issued a partical little booklet called "Short Cuts to Power Transmission." This book contains a considerable amount of practical information pertaining to the use of belts, including tables and other information of a more or less technical nature.

The R. Laidlaw Lumber Co., of Toronto, are adding some new equipment to their Dundas St. woodworking plant. The order has been placed with the A. R. Williams Machinery Co. and calls for the following machines:—Yates C 3 Moulder; Yates 108 Moulder; Preston Veneer Jointer; Peston Power Feed Rip Saw; C. M. C. Power Feed Rip Saw; Cowan Belt Sander; Cowan Jig Saw, and a special Trim Saw.

The first large passenger ship to be built in British Columbia was recently launched from the yards of the Wallace Shipyards Limited, North Vancouver, B. C. This vessel, which is known as the SS "Princess Louise," was constructed for the C. P. R. fleet. There is stateroom accomodation for three hundred passengers, while the dining room will seat one hundred and forty people. A separate second-class dining and smoking room has been provided. All the woodwork required for this vessel was fabricated in the woodworking plant of the Wallace Shipyards.

The Everett Mfg. Co., Limited, Sault Ste Marie, Ont., was recently incorporated with a capitalization of $100,000., for the purpose of manufacturing ironing tables, clothes dryers, step-ladders and other household woodenware. A. E. Stewart is the president of the company, C. D. Everett, vice-president and general manager, James Lyons, treasurer and P. T. Rowland, secretary. The other director consist of F. J. Buchanan, James Shaw and W. E. S. Bryan, all of Sault Ste Marie. The company expects to be operating by about the middle of November, and the object is to market woodenware throughout the world.

The Angus-Keefer Lumber Co. of Belleville, which was recently incorporated, have taken over the plant formerly owned and operated by the Thompson Furniture Co., Limited. The company are running a retail lumber yard and general woodworking factory, but do not contemplate manufacturing furniture until some time next year. The company have sufficient work in hand to employ fifty men the biggest part of the coming winter. The plant of the company is located at 111 Station St., Belleville. J. E. Angus is the president and manager of the new concern, and N. Keefer, secretary-treasurer.

Wood Specialties, 410 Parthenais St., Montreal, P. Q., is the name of a company which has been organized recently to manufacture and deal in wood products of various kinds. One of the chief items to be manufactured is spruce sounding boards for pianos. This is a move in the right direction and one that should be welcomed by the piano trade. Heretofore practically all the sounding boards entering into the manufacture of Canadian pianos have been brought in from the States. Now that this item, too, is being made in Canada, it is to be hoped that Canadian piano men will show an inclination to patronize home industry.

An Ottawa report states that contracts have been placed with a number of Canadian furniture manufacturers for furniture for the reading room, member's quarters, etc., in the new Parliament Buildings. The following firms were among the successful tenderers: Owen Sound Chair Co., Owen Sound; R. A. Sproule & Son, Ottawa; Interior Hardwood Co., Kitchener, Ont.; James A. O'Gilvy & Co., Montreal; Castle & Son, Regd., Montreal; Baetz Bros., Furniture Co., Kitchener, Ont.; Preston Furniture Co., Preston, Ont.; Henry Morgan & Co., Limited, Montreal; F. E. Coombe Furniture Co., Limited, Kincardine, Ont.; A. Krug & Co., Kitchener, Ont; Broomsgrove Guild, Canada, Limited, Montreal.

Thomas Finley, president of the Massey-Harris Co., Limited, Toronto, in commenting on the tariff situation, states that in his opinion free trade in agricultural implements means the inevitable shifting of the manufacture of such equipment for Western Canada, from Ontario and Quebec to the Western middle States. If there be neither tariff or sentimental preference to offset our geographical handicap, we shall be forced sooner or later to establish ourselves on equal terms with our competitors. So far as my company is concerned, we are not going to lose our Western Canadian trade, even if to retain it we have to build another factory in the Western States; therefore our workmen, and all co-related industries which furnish us with raw materials, are vitally interested in this question.

Steady position for the right man. State clearly first letter experience whom worked for, age, married or single, wages required, and when ready for work if application is accepted. Apply Box 117, Canadian Woodworker, Toronto. 10.

Business Opportunity

Canadian Patents and Registered Trade Mark of the Thermo-Myst Lumber Dryer FOR SALE

Excellent business opening to parties with knowledge of lumber industry and moderate amount capital, to establish a business for which there is a lucrative field in Canada. The Dry Kiln that has proven its merits in the United States. Write or call on R. MacLeay, 179 Duke St., Montreal, Que., for further information. 10

Alphonse Dugre, Notre Dame St., is awarded general contract for erection of office costing $50,000 for St. Maurice Lumber Co.

Building Plans for July in Manhattan Borough Extension

The report of Rudolph P. Miller, super-Manhattan, New York City, is to the effect that during the month of July this year plans were filed for fifty-three new buildings costing a total of $17,878,825, as against 141 costing a total of $6,269,800 for the corresponding month of 1920. The gain is mostly in office buildings. During July, 1920, plans were filed for the erection of nine to cost $2,190,000, whereas during July of this year six office buildings costing $13,500,000 were planned.

Strength Tests of Ideal Walls

An investigation has been started to determine the compressive strength of ideal brick walls in co-operation with the Common Brick Manufacturers' Association of America. The ideal walls are laid with common brick, but in such a manner as to include an air space in the wall and still be well tied together. There is a considerable saving in the number of bricks, the amount of mortar and the time required to lay these walls over the ordinary solid walls. It is also claimed that one can plaster directly on these walls, thus avoiding the expense of studding, lath, etc. The present schedule calls for the erection of three ideal walls and two solid ones for comparison. Four of the walls have already been built by the Bureau of Standards and will be tested as soon as they are 30 days old. Considerable preliminary work such as gauge calibration and the testing of individual bricks has already been done.

550-Ft. Concrete Warehouse Without Joints

A seven-story concrete building, 550 ft. long and 100 ft. wide, has been erected in Los Angeles as the third unit in the Los Angeles Union Terminal. The other two buildings are of the same general plan and are 600 ft. in length. Differing from the other units in a few particulars, the recently completed structure has no expansion joints. This feature very considerably reduces the number of columns because where expansion joints were put in at 200-ft. intervals in the other structures twin columns were requierd, a set on each side of the joints on each floor. Observations will be made to see what difference there is in the action of the buildings with and without expansion joints. Graduated brass gauges have been set at the top of the four corners of each building in prolongation of the side walls, and these will be read with a transit from time to time to note any change in position. Measurement of the movement of adjoining sections at the expansion joints will also be made. The design and construction of the building was in charge of J. H. Dockweiller, constulting engineer, at whose instance the expansion joints were eliminated from the design of the new unit.

What Constitutes Walnut Furniture?

A clearer definition of furniture terms is desirable, from the viewpoint of both manufacturer and dealer. We hear of furniture in solid walnut, real walnut, walnut finish, chrome walnut and other names of a similar nature. To the uninformed, which means to the buying public in general, this state of affairs is confusing and misleading to a large degree. A person may purchase a piece of furniture which has been described as "walnut finish," under the impression that they were securing a piece of solid walnut.

The American Walnut Manufacturers' Association have classified the kinds of furniture which may be sold as walnut furniture and bought as walnut furniture without deceit on the part of the seller or regret on the part of the buyer as follows:

1. Solid Walnut. This is a piece made entirely of walnut lumber, inside and out, in which no panels or veneerd plywood is used. There is relatively a small amount of such furniture manufactured, and it is usually hand work, produced on special orders.

2. All Walnut. This is furniture such as dressers and sideboards and tables, in which all the wood employed is walnut except that on table tops, drawer fronts and sides there may be walnut face veneer panels. This construction is really as desirable as solid walnut, and in many ways superior, and is the one most commonly used in genuine walnut furniture.

3. Standard Walnut. In this furniture all the surfaces and exposed parts, including all the solid pieces, such as rails, legs, and other exposed parts of the framework, are of genuine solid walnut. The larger surfaces may be of walnut face veneer panels as described above. The backs and interior parts may be of some other wood.

The following kinds of furniture cannot truthfully be sold as walnut, and in practically every furniture store in the country will be found furniture that comes under this classification:

1. Furniture finished in walnut brown, and having walnut face panels on the larger surfaces and perhaps a small amount of solid wood pieces in conspicuous places, but the solid wood being principally some other kind.

2. Furniture having only walnut face panels on the larger surfaces, with the entire construction of some other wood. In this classification falls a very large amount of the medium priced furniture that is to-day sold as American walnut. By weight or volume such furniture is less than one per cent. walnut, and should not be so designated.

3. Furniture made entirely of some other wood, including the face panels, but finished in a walnut brown. This is the cheapest of the different types of so-called walnut furniture to be found on the market, and the name walnut should not be used in connection with it in any way, as such use cannot help but be misleading.

About 6,000 tons of briarwood are shipped yearly from the island of Corsica to be used in the manufacture of pipes. The root is the part used. It is a small tree (not a briar) and is simlar to the laurel employed for pipes in this country. The name comes from a French word "bruye," meaning bush.

The Sidman

Lumber Curing Process

Can now be housed in a CONCRETE BUILDING

(Patent Pending)

We can now guarantee that our CONCRETE BUILDING, will lose no more heat units than the best constructed wooden building, and 20% to 40% less than brick, and HAVE ABSOLUTE CONTROL OF THE HUMIDITY.

A new departure in kiln buildings, perfected after years of experiment, and on top of many failures.

Some of the benefits:

Lower first cost. Practically no expense for repairs. Economy in operation, Fire Proof inside and out.

Let us tell you where you can see them in operation.

Information and Inquiries

You are cordially invited to make use of this department

Market for Dimension Stock

Warren, Ont., Sept. 23rd 1921.

Editor, Canadian Woodworker,—

I am about to operate a picket and dimension mill, cutting stock, especially for woodworkers, and furniture manufacturers. Can you give me any idea as to what might be considered standard sizes for dimension material of this kind? The stock I have runs up to 4 feet in length and can be sawn any dimension from 1-inch square up.

Yours truly,
D. I. WARREN.

At the present time there are no recognized standard sizes for dimension stock. The requirements of each manufacturer differ according to the lines he produces. The best thing for you to do is to get in touch with a number of furniture men or other woodworkers who make a practice of buying their material cut to dimension, ascertain their requirements and then quote on their business.

Built Up Table Rims

Victoriaville, P. Q., Oct. 3rd 1921.

Editor, Canadian Woodworker,—

Was wondering if you could tell us where we can secure built-up rims for tables, 48 x48 in either walnut or quarter cut oak.

Sincerely yours,
ALBERT HUDSON.

It is just possible that you can secure these rims in Canada either from Panels, Limited, Southampton, Ont., or from the Bruce Woodworkers Co., Limited, Chelsey, Ont. Other probable sources of supply are Gorham Bros., Mount Pleasant, Mich., Breece Mfg. Co., Portsmouth, Ohio, and the Jefferson Woodworking Co., Louisville, Ky.

Composition Carvings Wanted

Moncton, N. B., Sept. 30th 1921.

Editor, Canadian Woodworker,—

Will you kindly inform me where I can secure composition capitals, cut four sides, for 4-inch and 5-inch posts. Would like to deal with a Canadian firm, if possible.

Thanking you in anticipation, I am,
Yours truly,
A. P. LeBLANC.

Composition carvings, such as you require, can be secured from J. Walter & Son, Kitchener, Ont., and the Decorators' Supply Co., Archer, Leo & Lime Sts., Chicago, Ill.

Clothes Drying Cabinets

A large Canadian firm has sent in an inquiry asking to be put in touch with manufacturers of clothes drying cabinets, either gas or electrically heated. Any readers of the "Canadian Woodworker," who manufacture drying cabinets of this type, can secure the name of this firm by writing the editor.

Information on Bronzing and Burnishing

Montrael, Sept., 28th 1921.

Editor, Canadian Woodworker,—

Can you instruct me how to bronze and burnish hand-carved picture and photo frames? Would be very much obliged for any information that you may be able to furnish on this subject.

Sincerely yours,
A. ALEXANDER.

We have not any information covering this particular operation and do not know where you can secure any. Any readers of the "Canadian Woodworker," who have had experience in bronzing and burnishing can help out a fellow-workman by sending a brief description of this operation into the editor of this publication.

In Market for Wire

A Gilmore, Coaticook, P.Q., manufacturer of chairs, uses a considerable quantity of 14-gauge wire in the run of a year, and would like quotations in ton lots, delivered at Coaticook, from interested parties.

Small Wood Balls Wanted

Toronto, Oct. 12th, 1921.

Editor, Canadian Woodworker,—

Can you tell us wher we can have 1¾-inch wood balls turned for a small bowling game we are manufacturing? We have tried all the wood turners in Toronto, but find that their prices are too high. This is due perhaps to the face that they are not equipped with automatic machines for producing articles of this nature. Any information you can supply will be appreciated.

Yours truly,
Alliston Wood Products, Limited.

It is just possible that you can secure the turnings you require from the following manufacturers: Canada Wood Specialty Co., Orillia, Ont.; Wood Turning Products, Limited, Fenelon Falls, Ont.; Otterville Mfg. Co., Otterville, Ont.; Knight Bros. Co., Burk's Falls, Ont.

The Lumber Market

Imported Woods

A distinct improvement can be noted in the lumber situation in the various producing centres in the United States. The demand for hardwoods of all kinds, and more particularly for the upper grades, is showing signs of increasing, and at the same time inquiries are coming in in a very satisfactory manner. The tone of the whole market is better, and the opinion is current that the situation has finally and definitely turned for the better. There has been an advance of from $3.00 to $10.00 per M on many upper grade items. This is due to the fact that there is a marked shortage of good stock.

The wood-using industry is gradually coming to the conclusion that the lumber situation is not quite as favorable as they were fond to assume. Production has been low for many months, and while in the spring the amount of manufactured lumber on hand was practically equal to normal, this has been gradually reduced from month to monuth until to-day we find the stocks badly broken and upper items practically off the market. It has been stated by those who are in a position to know, that it would be impossible to secure sufficient high-grade hardwood to fill one thousand cars. As there are thousands of lumber-consuming plants who could handle many carloads, it will be seen that the supply of high-grade lumber is not nearly sufficient to meet all possible and probable requirements.

In the Memphis district it is generally agreed that not only is there a better undertone to the whole market, but that values as a whole have stabilized and stiffened dnring the past few weeks. This applies chiefly to all grades above No. 2 common. Production is extremely light, not only at the present moment, but for the balance of the year, while shipments are increasing in a gratifying manner and orders and inquiries are coming in more freely. There is not much demand for the lower grades. Consuming interests are taking a greater interest in the market and are showing a more pronounced tendency to buy. A report from Evansville, Ind., is along similar lines. Collections are good and genral business conditions show an improvement.

According to a Louisville, Ky., report, the demand for high-grade hardwoods continues to increase without any corresponding increase in production. At the present moment there is very little stock to be had which will grade No. 1 common or better. The flooring mills are doing a nice volume of business and are in the market for oak. Walnut is in strong demand, as well as poplar and red gum. The other hardwoods are not showing any increased activity. Since September 1st the better grades of red gum, oak and poplar, have incresed anywhere from $5.00 per M up.

The reports from practically all the hardwood-producing centres are extremely optimistic, and this optimism seems to be justified, in view of the fact that the advance of from $3.00 to $10.00, which has taken place, is general, and is not confined to any one market or any one locality. From the fact that the improvement is general, it is safe to assume that the market has taken a decided turn for the better.

Domestic Woods

Signs are not lacking which would lead one to believe that the improvement manifested in the lumber markets is an indication that the corner has been definitely rounded. This is not borne out so much by any large increase in the volume of sales made, but more by the fact that a much better feeling exists in lumber centres and that the price-cutting and price readjustments, which have been such a disturbing factor in the past, are over and prices are more or less stabilized. This statement has been made before, but to-day it is made with greater assurance than ever in the belief that the bottom has been reached. Several large sales of pine and hemlock running into millions of feet, have been made during the last few weeks. True this stock was turned at a low figure, but the fact that it was turned at all is a good omen. Both these woods are beginning to show signs of returning strength, and it would not be at all surprising if quotations on the sotcks were to show a tendency to increase. Probably one of the weakest items on the list is spruce. Very little of this wood has been moved during the present season. What call there has been for this lumber has been for the better grades. Coming to hardwoods, there is a slight improvement in demand, coupled with a scarcity of the upper grades in the heavier stocks. The offerings in birch, maple and similar woods are limited, and any quotations made are being given on the basis of No. 2 common and better. The furniture factories are coming into the market in greater numbers and the implement and motor car manufacturers are displaying a tendency to sort up and replenish their short lines.

There have been many rumors going around with regard to the quantity of lumber on hand, the amount cut during the past season, the number of sawmills shut down and the limited nature of the logging operations for the coming season, preparations for which are now being made. It is not possible to present any general outline covering the probable cut during the coming winter, and comparing it with that of a year ago. Conditions differ in various localities. There are, however, several features which practically parallel themselves in all centres, such as the drop in wages and the readiness of the men to enter the woods.

One reason why it is difficult to give a clear outline of coming operations is the fact that many millmen are adverse to giving out any information with regard to their future operations. It is about as one correspondent has suggested in his reply to our inquiry for information with regard to their future operations. It is about as one correspondent has suggested in his reply to our inquiry for information on his woods operations: "We expect to be doing very little in the bush this fall. If conditions continue to improve we shall, probably, do as some others do and shout that we are not going into the bush at all, and then go in and take out all the logs we can."

If you have a great deal of repetition work to do on a spindle, do not use the slotted cutters, but have a special solid cutter made to do the work. Five or more cutting edges are much beter than two.

It will certainly pay you to try high-speed steel cutters for long runs of mouldings. Be sure that your workmen do not spoil these cutters by overheating them in the grinding.

WHERE FINISH IS A MOST IMPORTANT FACTOR

Carborundum Brand Garnet Cabinet Paper

¶On beautiful cabinets, highly finished table tops—on any work that is to be hand sanded the workman simply can't go wrong if he uses Carborundum Brand Garnet Cabinet Paper.

¶In a Jamestown plant they use it for sanding varnished cabinet tops. Four tops to a single sheet is the average and the workman does seventy-five tops a day.

On sanding ornamental grills they find that Carborundum Brand Garnet lasts from 40 to 50% longer than any other paper they have ever used.

¶The workmen say that the Carborundum Brand Paper is remarkably uniform—that it gives a smooth, clean, "scratch-less" surface. Then, too, the backing is tough, yet flexible, never rolling or peeling under the hand.

Once again it is proved that Carborundum Brand Garnet Products Make Good Sanders Better Sanders

A KILN is as GOOD as its PROCESS—
plus its EQUIPMENT—
plus the SERVICE of the MAKER—
plus the ORGANIZATION back of it all—

OUR PROCESS assures the control of the three fundamental factors—HEAT—HUMIDITY—CIRCULATION.

OUR EQUIPMENT is guaranteed complete, sturdy in construction, simple in its installation, economical to maintain.

OUR SERVICE is the broadest—engineers for layouts, building designs and operation—superintendents for erection and installation—experienced woodworkers for consultation and service during the life of your kiln.

OUR ORGANIZATION has been composed of woodworkers for thirty-five years, men who know wood and have handled it through the complete range of manufacturing operations.

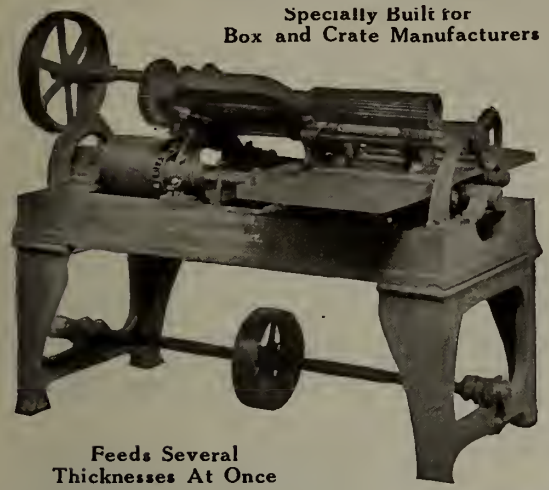
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

Chattanooga Machinery Company
Chattanooga, Tenn.

We Manufacture a complete line of

Chair, Cane-Cutting and Bending Machines

CUTS AND CATALOG UPON REQUEST

MORGAN
NAILING MACHINES

Are built strongly for heavy continuous service. Machines adapted to all kinds of special nailing.

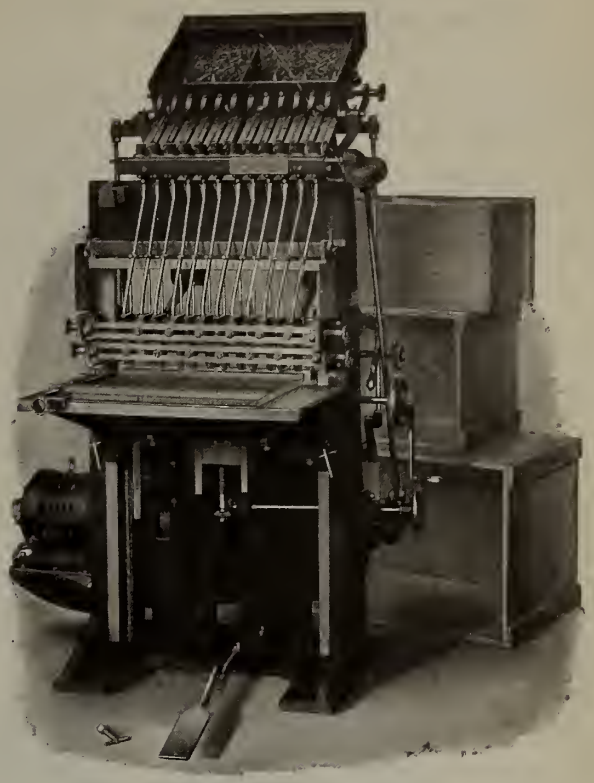
Regular machines for all sizes of boxes and crates.

Write us for descriptive literature.

Machines that save money

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.



Morgan No. 12-30 Open Back Nailing Machine, Fitted with motor.

THREE GUESSES

Is it economical ?

Is it the right type ?

Is it the right size ?

Electric power, heating, lighting and equipment problems are to be found in the woodworking industry.

Perhaps your output can be increased? You are, perhaps, losing electrical energy by wasteful types of motors? Are your switches and wiring devices up-to-date or are you in continual danger of fire?

We shall be pleased to answer any questions or help you with any problems whenever you care to write us.

Twice Monthly **Electrical News** **$2.00 per year**

347 Adelaide St. West., TORONTO

Please send the "Electrical News" to the undersigned until further notice, for which find enclosed Two Dollars, being One Year's Subscription in advance.

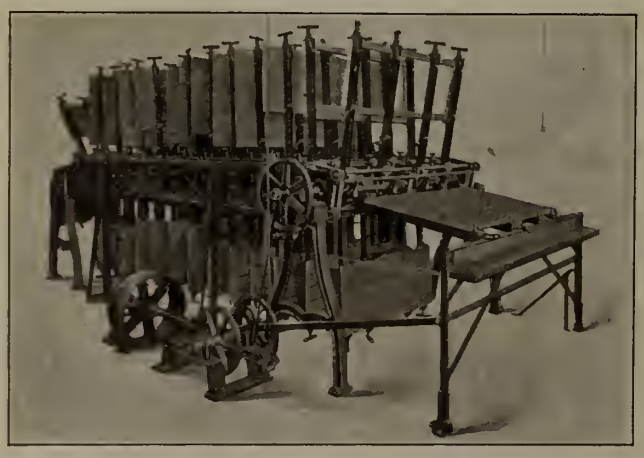
One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier



For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carrics the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.

STARTED right with the finest nickel alloy steel and made mechanically right by expert saw makers Simonds Band Saws have long been recognized as leaders in woodworking shops. They hold their tension and retain their cutting edge longer.

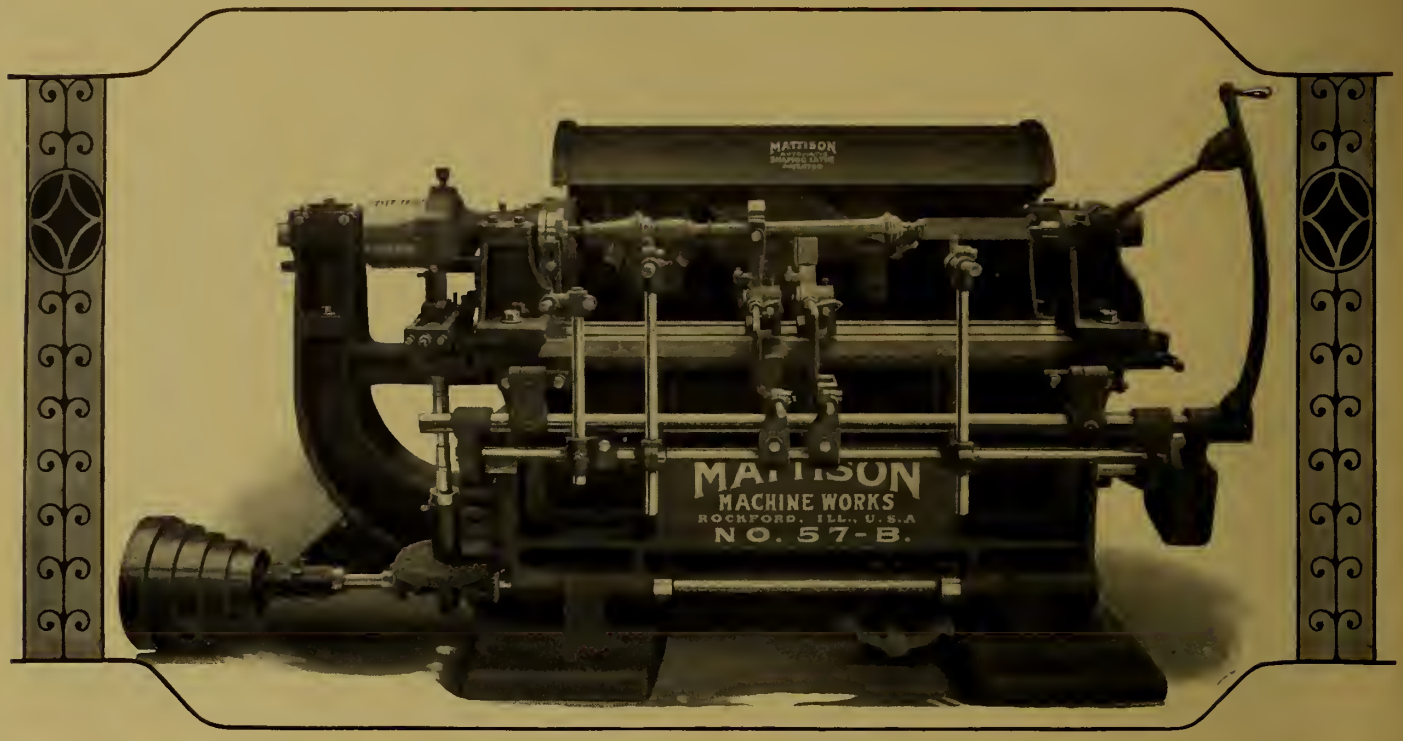
MATTISON
Automatic
The Standard Shaping Lathe
OVER 3000 IN USE



New Styles Demand More Turnings

The Mattison Automatic Shaping Lathe produces turnings much faster and cheaper than is possible with hand methods or with old style machine equipment. But of even greater importance is its flexibility which gives your designer free play in creating his designs. It faithfully reproduces all the historic round, square and octagon turned work, which plays so important a part in the new, distinctive patterns of today

If it is worth while to bring out new patterns, isn't it just as important to give equal consideration to the best and most economical method of producing those patterns?

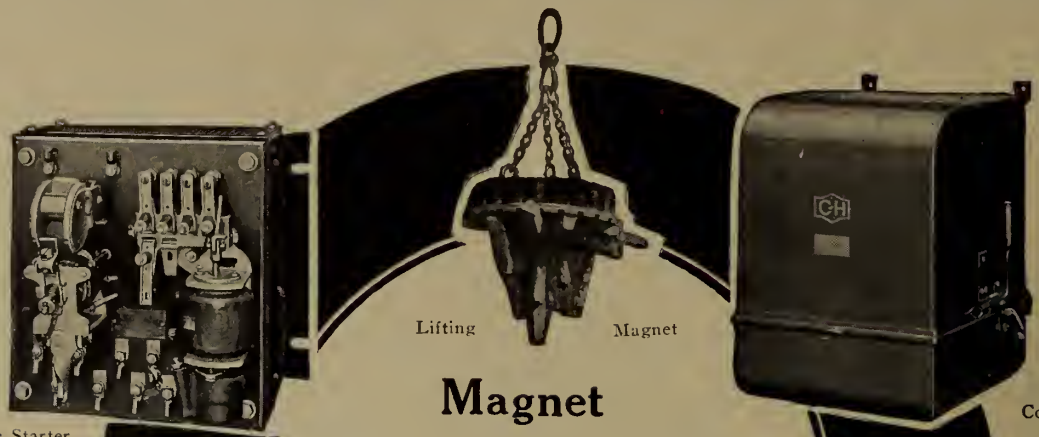
CUTLER-HAMMER



Lifting Magnet

Automatic Starter

Compensator

Magnet and Control Devices

¶ Cutler-Hammer Lifting Magnets and Magnetic Separators have proved of exceptional value in the mining field, in steel mills and in many other industries for lifting and separating metals. The Magnetic Clutch and electrically operated Brake, used primarily in steel and rubber mills and for crane control respectively, are widely applicable to many industries where the gradual engagement or adequate braking of a load is desirable.

¶ In electric controlling devices of all kinds Cutler-Hammer is the recognized standard of dependability, whether for fine speed adjustment of a machine, extremely close voltage regulation, the wonderful light dimming and colour effects in a modern theatre, or the automatic control of heavy loads or other special operations.

¶ Details and recommendations of suitable Cutler-Hammer apparatus for your control problems are available at our branches

D K McLAREN

Wherever a D. K. McLaren Genuine Oak Tanned Leather Belt is in service, there you will find a machine free from all transmission troubles and an owner satisfied he has the best belt money can buy.

It's very simple. In the first place, only the finest hides are selected, and these are tanned by the famous oak process. The result—a perfect belting for all transmission purposes. Strong, non-slipping, stretchless, economical.

Can you afford to use any other?

D·K·McLAREN

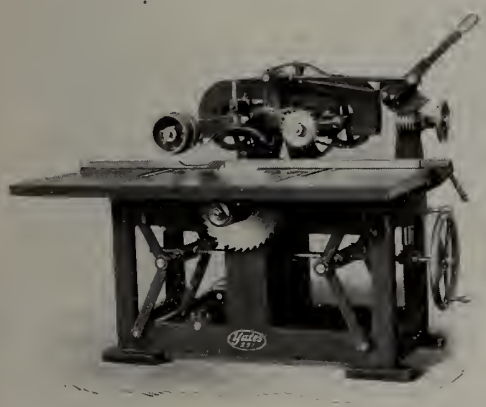
LOOK

We make the Smaller Ones



No. 257 Self Feed Rip Saw

No. 225 Saw Table

No. 199 Buzz Planer.

We've had the following remark made to us a number of times lately—"We didn't know that you built small woodworking machines" This set us thinking that no doubt there are a lot of others who don't know that we make the smaller types of Woodworking machines—we certainly do and have made them for a good many years, although we took for granted that the public knew we built them, because we made Woodworking machinery. It's our fault – our heavier machines have had first plaee in our advertising, therefore the public came to the conclusion that we only made the heavier types—no siree, we make the little fellows as well—these shown are but a few, we'll show you more next month.

If you want any information in connection with small machines, or any of the machines shown above, drop us a line we'll gladly send you any data you may require.

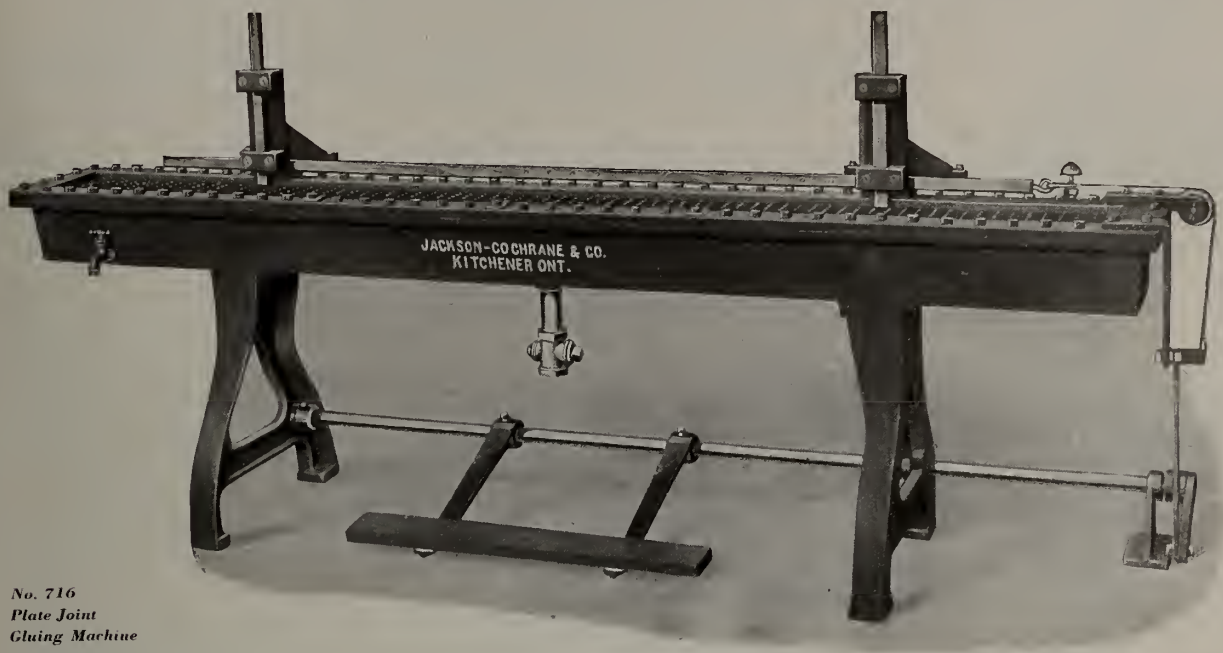
A NEW PLATE JOINT GLUE SPREADER



No. 716
Plate Joint
Gluing Machine

YOU CAN DOUBLE THE PRODUCTION OF YOUR GLUE CLAMPS WITH THIS NEW MACHINE

A thoroughly tested and tried machine that operates easily without waste or mess. It will more than double the production of your clamping equipment. This was proven when it was recently given a thorough trial in one of the largest furniture factories in the Dominion.

The method of operation is simple. The operator presses the foot lever down, forcing the perforated plate up out of the glue. Then by resting the edges of the stock on the plate and moving them backward or forward about one inch, the edges resting on the plate will be instantly and completely spread with glue. On releasing the foot lever the plate is lowered into the glue ready for the next batch of stock.

The tank is 5″ wide and 5″ deep.
Perforated plate is 4″ wide, ⅜″ thick and 1″ shorter than tank.

Size	Floor Space	Weight
5′ 11″	7′x2′	700
7′ 11″	9′x2′	800

P. L. Robertson Mfg. Co., Ltd.

Milton - Ontario

To the manufacturer of furniture nothing could be more logical than the use of the Robertson Patented Socket Head Wood Screws.

It matters little whether the screws are driven by hand or machine, the saving in time and labor is the same. And, of course, with this screw the work is much neater, for the driver never sleps out, consequently scratches and other disfiguring marks are eliminated.

Used by Canada's largest manufacturers.

Write us for samples, prices and full details,

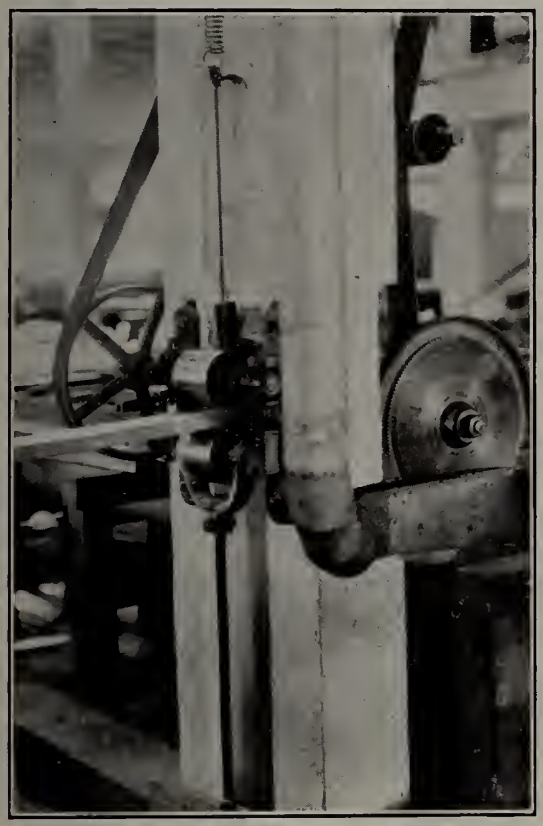
A Real Trimmer



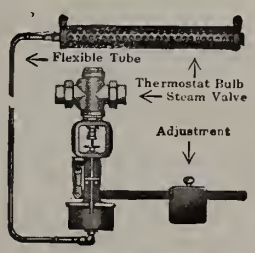
This is a high speed machine to be used in sawmills and box factories where speed is required. Allows men to use both hands when trimming. Nothing to get out of order. This is the fastest trimmer on the market.

Arbuthnot Lumber, Sash and Door Co.

Vancouver, B.C.

You Don't Guess Time! Why Guess Temperature?

In the glue kettle, the varnish drying room, the dry kiln—wherever there is a need for maintaining a definite, even temperature, the Powers Automatic Heat regulators give "100 percent perfect" results. They are always on the job—accurate, sure, reliable. They prevent overheated glue, checked or case-hardened lumber, crazed varnish—all the errors that are so apt to creep in with manual control.



The Powers Regulator No. 15

Entirely self-contained. Peculiarly adapted for control of drying room, kiln, etc.

Other Powers Regulators for other places. Ask for details.

We shall be glad to give you the benefit of our more than thirty years experience in temperature regulation, and if you will tell us where you would like to try out a Powers Regulator, we will send the right one for thirty days' trial. If you don't find it satisfactory, send it back.

ECONOMY AND RELIABILITY GOES FAR

LACTOCOL

STANDS THE STRAIN

THE COLD WATER GLUE
IN POWDER

REQUIRES NO HEATING OR RE-HEATING. PREPARED IN A MOMENT BY MIXING AN EQUAL VOLUME OF COLD WATER WITH THE POWDER. YOUR GAS BILL BE HALVED AND YOUR OUTPUT CONSIDERABLY INCREASED BY USING LACTOCOL, THE GOVERNMENT APPROVED GLUE.

LACTOCOL IS SPECIALLY ADAPTED FOR GLUEING LARGE SURFACES, AS IT DOES NOT SET PREMATURELY LIKE CAKE GLUES. IT CAN BE USED FOR THE MOST DELICATE OPERATION OR FOR THE LARGEST WORK WITHOUT THE POSSIBILITY OF FAILURE.

ALL JOINTS MADE WITH LACTOCOL ARE WATERTIGHT AND UNAFFECTED BY HEAT. IT IS GUARANTEED TO WITHSTAND A STRAIN OF CONSIDERABLY MORE THAN 1,000 LBS. PER SQUARE INCH. IT SETS HARD AND THE JOINT IS STRONGER THAN THE WOOD. LACTOCOL IS EASILY APPLIED, GOES A LONG WAY, AND IS PERFECTLY RELIABLE.

Used for all classes of Joinery and Builders' Work either inside or outside, Cabinet Making, Parquet Floors, Wooden Tanks and Receptacles, Upholstering, Built-up Mouldings and Cornices, Carriage Building, etc., etc.

LACTOCOL WAS APPROVED BY THE GOVERNMENT FOR CLASS 1 AIRCRAFT CONSTRUCTION.

Test it against the Glue you are now using. Lactocol has proved itself to be the best and most economical of all.
LACTOCOL is used extensively in Canada in the mass production of joinery work.

Manufactured solely by

LACTOCOL LTD., 2 STUDLEY ROAD, LONDON, S.W. 4.

Holloway, Randell & Co., Ltd.,
Halifax, N.S.

Dear Sirs,—

Your favor of July 30th to hand, asking if we found Lactocol Cold Water Glue satisfactory. In reply, we may say that it is perfectly satisfactory. We soaked a glued piece of Douglas Fir for forty-eight hours and we were unable to take it apart.

Yours very truly,
D. G. KIRK WOODWORKING CO. RHD/MD

CHAPPELLS LIMITED
Wood Workers and Builders
SYDNEY, N.S., Aug. 1, 1921.

Messrs. Holloway, Randell & Co., Ltd.,
Halifax, N.S.

Dear Sirs,—

Replying to your communication of July 29th, would say that we have tested out Lactocol Cold Water Glue and up to the present are entirely satisfied with results in connection with its adhesive qualities. Another feature which Lactocol has is its price, which we find compares favorably with the ordinary glue on the market; the initial cost is a little more, but on account of its economic quality, we find it is cheaper in the long run.

Yours truly,
CHAPPELLS LIMITED

Iron Founders and General Machinists
Pattern Work a Specialty
DARTMOUTH, N.S., June 20th, 1921.

Messrs. Holloway, Randell & Co.,
Halifax, N.S.

Gentlemen,—

We have given your Lactocol Cold Water Glue some very severe tests, namely, joining two pieces of teak, which, owing to its oily nature, makes it almost impossible to join satisfactorily with ordinary glue; also we joined a piece of hemlock to white birch, which withstood heavy hammer blows, and after being submerged in sea water for over 12 hours, still clung together as tight as ever.

We, after making these tests, highly recommend this glue for any kind of woodwork.

Yours very truly,
THE DOUGLASS FULLERTON CO., LTD.
Per H. B. Douglass.

Referred to in an article on page 90 of the October issue of this paper, entitled

Development in Veneering Practice

We quote one paragraph as follows:

"There is one type of re-drier which has been constructed specially for handling veneers and cross-banding. It is known as a hot-plate redrier. The principle is that the veneers are placed between hot plates which are brought together, straightening and drying the veneers at one time. The plates are so actuated that they come together and separate again in a breathing or bellows-like movement. When under pressure the stock is straightened and heated, then when the plates separate momentarily, the vapor formed has a chance to escape and the stock is given an opportunity to shrink. This alternate opening and closing goes on until the stock is dry. If the pressure were to be applied and kept on, the moisture would not be able to escape so readily, and as the stock would be held between two flat surfaces, shrinking would be resisted, with the result that checks would appear. The hot plate type of redrier is in operation in many plants and seems to be the logical equipment for this work."

MERRITT ENGINEERING AND SALES COMPANY LOCKPORT N.Y.

It pays to install a "Merit" Re-drier

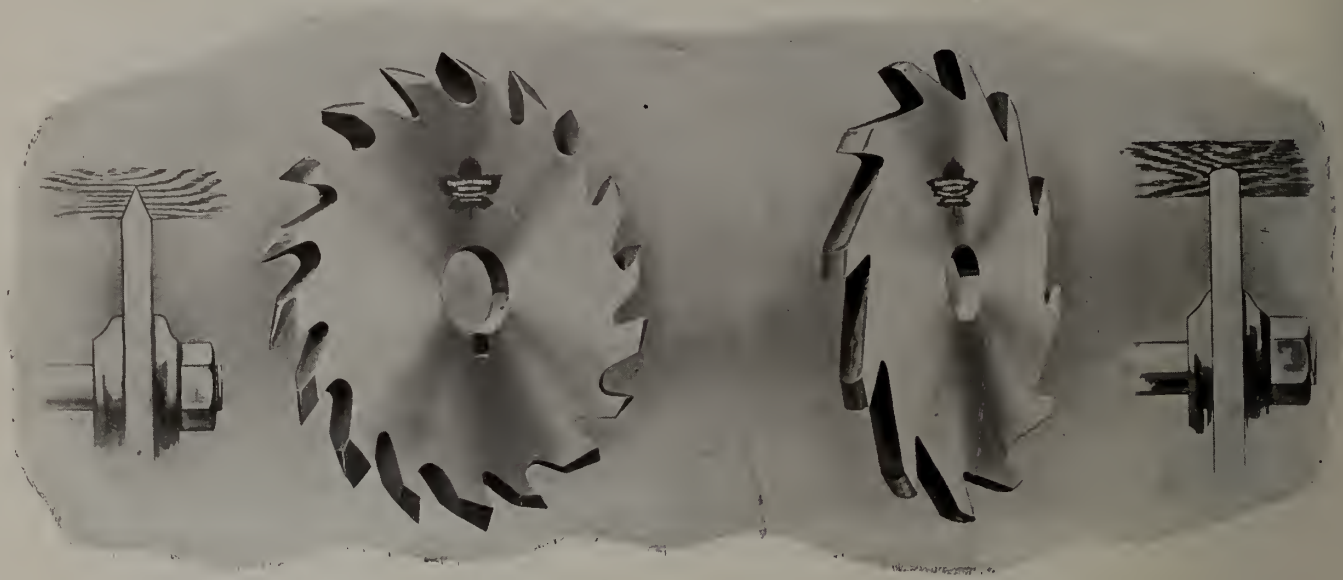
The "MERIT" Re-Drier

for veneer

is but one application of the "MERIT" HOT PLATE SYSTEM to the drying of thin wood, pulp board, asbestos board, and other material in flat or sheet form.

MERIT

MAPLE LEAF SAWS



Maple Leaf Saws will give you just that steady, day-in-day-out service that means so much in your plant. They are made with this object in view. The whole process of their manufacture, from the selection of the highest grade steel to the time they leave our hands is attended to with the greatest care.

The complete line includes Bands, all kinds of Special Saws for Special Work, Cross-cut Saws, Gang Saws, Dado Heads, etc. Every one guaranteed to merit your approval.

Do it Easier Quicker

TROY SEALING TAPES

Troy "Magic" Plywood Tape

Will simplify and increase your production without increasing cost.

Its use entirely eliminates the slow, tedious process of sanding and scraping.

You simply moisten and apply Troy "Magic" as you would any tape.

The difference is in the removal of it, which requires but a few moments soaking and one quick jerk.

The whole strip peels off in one piece—easily, quickly, leaving the surface smooth and clean beneath. No sanding, no scraping necessary.

Let us send you samples for a test. We furnish Troy Magic Plywood Tape in paper or cloth, any width or weight, and guarantee every inch of it.

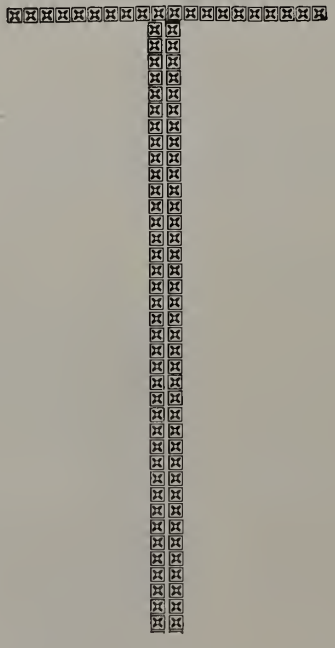
Fibro-Kane Patented OPEN WEBBING



"THE perfect substitute for genuine open cane webbing." Takes a stained or enameled finish much better than genuine cane and retains it. It does not dry out and crack or break around the edges. A piece inserted in a chair or other article of furniture and subjected to the hardest possible wear in your factory or home will prove it to you.

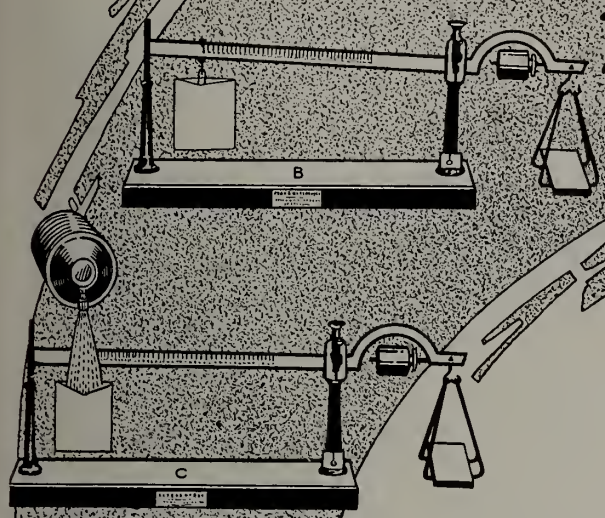
Fibro Manufacturing Co.

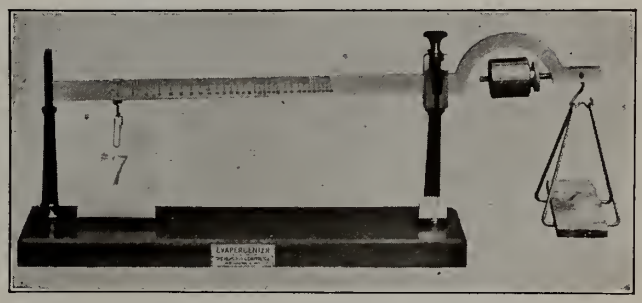
Drexel Building

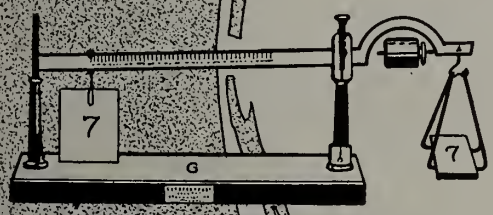
Philadelphia - Pennsylvania

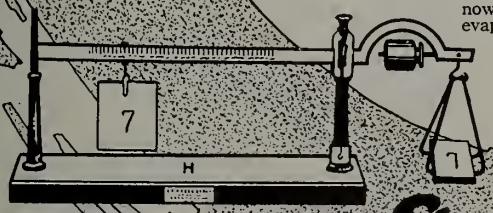
Evapercenter

for Finding Moisture Content









Method of Procedure

A. Hang clip with envelope on scale bar at "0."
B. Place test piece on scale.
C. Fill envelope until scale balances.
D. Detach envelope and mark both test piece and envelope with identifying number.
E. Repeat foregoing operations with any number of test pieces as desired.
F. Bake test pieces on heater or in oven until they are bone dry.
G. When bone dry, place test piece on scale, select envelope with same number and hang it in place.
H. Move slide with envelope until scale balances. Scale now indicates percentage evaporated.

Something New and Practical

The EVAPERCENTER determines moisture content without actual weight being known—percentage is based on the bone dry weight only; no tables to refer to, no calculations to make.

Samples can be of any gross weight, and large and varied in size.

The EVAPERCENTER will operate on any nominally level surface.

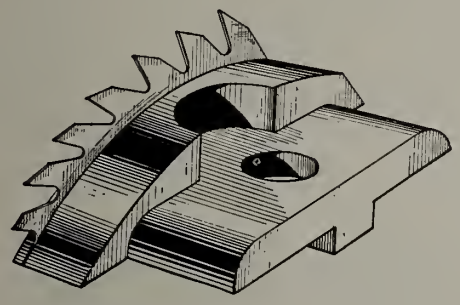
The Shuff Sticker Saw Head Attachment



Canadian Patent No 212337

This attachment will double your moulder production, widening its range of performance and effecting a real saving in the running of pully stiles, blind stops, cove, parting stops, window stops, fillet, glass bead, base moulding, ceiling, lattice moulding, screen moulding, base shoe, quarter round, stools, panel moulding, etc. Used for splitting moulding when two or more are run at the same time, a decided improvement over the flat knives for this purpose ; also used or rabbeting and grooving.

The attachments are furnished in pairs of rights and lefts, are made of solid brass, each pair properly balanced and saws sharpened and set before shipment. Made in all sizes to fit any moulder. When ordering send sketch of end view of sticker head. Cut smooth and are easily set up. Price $30, 00 in American funds f.o.b. Waukesha, Wis.

MAHOGANY

Rarely are such stores of precious wood to be found as may be seen in our yards. Across the seas from tropic lands it comes. From thick jungles where the light of day but dimly penetrates and where tangled native paths make difficult the bringing out of timber. Here the black man labors, risking life from jungle dangers, that supplies will not diminish and your orders may be filled.

Twelve million feet per year is the capacity of OTIS mills. An adequate supply is always on hand for prompt shipment. Get our prices.

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

AMERICAN WALNUT

"The Cabinet-wood of the Ages"

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

SALES AMMUNITION:

Our "All-America" campaign for American Walnut *Trade Extension* through advertising is furnishing alert manufacturers and dealers with innumerable selling arguments. The *Walnut facts* alone are what clinch the sales. The best public is "all for American Walnut."

In all of our advertising, including the beautiful series of four-color illustrations in the leading magazines, we are continually driving home the long list of American Walnut's simple and enduring virtues—rich *natural* color, supreme stability and strength, easy working properties, and *unfading* beauty. No stain is needed to produce the royal elegance of warm browns so coveted by the best trade.

One of the chief causes of the steadily rising demand for American Walnut furniture and interior trim is its faculty for *growing in beauty with the passing of the years.*

"The Cabinet-wood of the Ages" is a true phrase.

Our Walnut Brochure, de luxe, is filled with ideas and suggestions of interest and value to the trade. A request will bring it, with our compliments.

THE NECK OF THE BOTTLE

That is just what your dry kiln and cutting room are to your business.

The volume and quality of your finished product is very largely dependent upon the capacity and efficiency of your dry kilns. Very often this is inadequate.

As a remedy, we recommend that you use "Chicago Mill" Dimension Stock.

First: Because we manufacture stock in strict accordance with your specifications in grade, size and moisture content.

Second: Our Cairo, Illinois, plant, with a kiln capacity of more than 1,500,000 feet per month, is strictly a Dimension Lumber Operation.

Third: "Chicago Mill" stock is cut not accumulated. It is prepared for shipment in bundles which are uniform in size and convenient to handle. Your shipping schedules are strictly observed.

Fourth: The use of "Chicago Mill" Dimension will eliminate waste and effect a saving of at least 40% in freight.

Fifth: It will mean a minimum investment by you in raw materials and in equipment.

Price Cutting too Prevalent

In which direction is the Canadian woodworking industry heading? Is it progressing forward or is it sliding backward? One would naturally think that as general business conditions continue to improve and as the demand for all lines of wood products is becoming increasingly active, there could only be one reply to such a query. If sound business principles were being followed in this industry, if all items were being sold on a basis of cost plus, that would hold true, and one could safely say that those engaged in woodworking were building on a solid foundation and moving toward an era of increased prosperity.

The "if" in the foregoing paragraph may be taken to represent individuals or organizations which make a practice of cutting prices, of selling below a fair market value, and in many cases of disposing of their product below actual cost. There are those who are willing at all times to give a quotation an extra slash or two, taking a chance that they will be able to make out or working on the principle that if they do not secure the business, their competitor will not stand to make much profit on the transaction. In this respect price-cutting has always prevailed to a greater or less extent.

When conditions were different, when there were enough orders to go round, the fact that a certain amount of business was transacted at a loss passed unnoticed. Usually only such orders as showed a profit were accepted, the undesirable business being left for the other fellow—the other fellow not always realizing that he was working for little or nothing. Now when competition is keen, when a strong effort is made to secure all the business which offers, the price-cutter looms up as a factor of no small importance. That in itself is bad enough, but what is worse is that many who know what they are doing, at least, as far as costs go, have entered the lists, and to-day prices are being cut in an unprecedented manner.

It is time that a halt was called to this unsound practice. If working without a profit is all that is involved, it would be bad enough, but there are other factors to consider. Selling any article near, at, or below its true cost, based on normal overhead and replacement values, may result in a slight increase in demand, but, at the same time, such practice is unsound, economically, as it tends to establish fictitious values below the actual level which should prevail. This applies with equal force to furniture, phonographs, sash and doors, boxes and woodwork in general, for this condition is prevalent in all branches of the industry.

Perhaps a few illustrations might not be out of place. Almost everywhere one goes, incidents are cited where some competitor is accepting business at a loss. One woodworker recently quoted $47.75 on an order for sash. Later upon making inquiries he found that the business had been secured by a rival manufacturer at $31.50. According to the figures of the first man, the lumber involved was worth over $31.50. Certain tables are being sold to-day for $11.50 which actually cost in the neighborhood of $16.00. The same can be said of a line of dressers, the price of which is far below replacement cost. This is bad enough in itself, but there is also someone who says, "I can sell as cheap as the next," or "I am prepared to lose so much," and the field of price-cutting activities is thus increased. The humorous side, if there is any humor in such a situation, is that usually it is the small, uninformed operator, who is the first offender, but he is soon out-shadowed and outdone by the progressive concern which, realizing that it is losing money, deliberately sets out on a price-cutting jaunt in an effort to down what it considers unfair competition.

Any one guilty of cutting prices admits one of four things; that his first price was too high; that his product is below standard; that he is woefully lacking in cost knowledge, or that his competitor is a better salesman. The last item may be the key to the situation, for it has often been suggested that those in the woodworking industry lack constructive sales ability. To them the only way to meet competition is to undersell instead of outsell. If that is so, the remedy should not be hard to find nor difficult to apply.

In the long run the person or firm who, backed with accurate cost knowledge, places a fair value upon their product and then sticks by that price, is usually the one who stays in business regardless of the fluctuation of demand or the ups and downs of general conditions.

Is 1922 to be a Furniture Year?

Rests Largely With Manufacturers Themselves—Publicity Campaign Now Under Way, if Kept Going, Will Materially Increase Sales of Furniture —Are You Lending Your Support.

By L. R. WRIGHT.

The Home Furnishings Bureau is again fuctioning. November 1st, when the Bureau advertisements appeared in a number of the leading newspapers of Canada, witnessed the commencement of the second general publicity campaign to be staged by certain of the furniture manufacturers of Canada.

It is too early in the campaign to make any forecasts though to date the results have been very encouraging. A number of the supporting members can trace sales directly to these advertisements. While this is encouraging, it is only a side issue for the main purpose of the whole scheme, the goal at which all the publicity is directed, is to rouse the buying public to a greater interest in their homes and the manner in which they are furnished and in this way increase the demand for furniture. It goes without saying that this requires time.

The campaign is being well received by both public and dealers. The plan being a little more direct this year, offers the dealer an opportunity for closer co-operation. Full advantage is being taken of this, with the result that as the advertisements appear many dealers are making a special drive on the furniture shown. Last year when the initial campaign was put over, the dealers were carried away by their enthusiasm and the immense possibilities which lay in a co-operative effort of this kind. Naturally when the scheme fell through, their hopes were dashed to the ground. This year they are not being carried away to such an extent, but are basing their support and co-operation on a more matured judgment. That the manufacturers are on the right track in putting across a co-operative scheme to increase the interest in furniture is evidenced by the fact that they are receiving the most support and the closest co-operation from the shrewd, far-sighted dealers. To them this offers a means which, if taken full advantage of, will place the whole furniture industry on a new and higher plane, and, as a result, they are bending every effort to help.

There is a primal instinct implanted in the breast of every member of the human race, which demands a home. It may be more highly developed in some than in others, but it is there, like the Divine spark, which causes even the most ignorant savage to look to a Deity of some kind. This constitutes the raw material on which the manufacturers have to work. The desire for a home already exists and all that remains to do is to develop and strengthen it. That the public is in a receptive mood and is taking kindly to this campaign, cannot be disputed. The proof lies in the fact that each mail, since the advertising started, has brought in from thirty to forty letters containing 10 cents and a request for a portfolio containing reproductions of the complete series of advertisements. This in response to a small footnote appearing in each advertisement to the effect that such a porfolio will be forwarded on receipt of 10 cents. Just copies of a series of advertisements yet from thirty to forty people daily are sufficiently interested to remit a dime.

All this would seem to indicate that the time is ripe for a far-reaching campaign and that the results from such a publicity effort would be highly gratifying. It has been demonstrated time and again that regardless of general conditions and without respect to the attitude of the public, a publicity scheme carried out on a comprehensive scale and over an extended period, can mould the tastes and desires of the people at large and create a market for almost any product. The essentials are attractiveness of copy, breadth of scheme and persistency.

The campaign staged last fall was well conceived and well developed. The copy was attractive and struck home. Yet it did not reach its goal for lack of

Type of advertisements which are being run.

persistency. The effect of advertising is cumulative. The first appearance of an ad. or of one of a series, may not have any startling results, neither may the second or third, but each one has its effect and as the constant dropping of water will wear away the hardest stone, so will advertising, if persisted in, bring the desired results.

The campaign staged last fall was not carried through as a continuous publicity effort. Just when it was beginning to bring results, just when the attention of the public was beginning to be focussed on home furnishings, the advertising stopped. Had this been continued throughout the winter and spring, it would undoubtedly have meant many dollars in the

pocket of every furniture manufacturer. Will the same fate overtake the campaign which was launched a few weeks ago? Will it wither and die for lack of support? It would appear to be a mistake to plan a short campaign. It is so easy to drop it when the first push is over. Continuity of effort is necessary This can be obtained only when plans are laid far in advance. The American furniture men are planning a three-year drive and will not make a start until sufficient funds are forthcoming to complete the whole plan of campaign. That may be working unnecessarily far ahead but it is certainly not too early for the Canadian manufacturers to work and plan for 1922. Why not adopt the policy agreed on last year, namely, one per cent of sales, and continue the drive all through the coming year. Z. G. Simmons, Sam Karpen and others have staked their reputation on their belief that the sales of furniture can be doubled in the United States if all concerned will support their campaign. The same can be accomplished in Canada. One per cent of sales does not seem to be a very high price to pay when such large results are possible. Every furniture manufacturer should be a member of the Home Furnishings Bureau and lend his assistance in putting across the "Better or Furnished Homes" idea. Is 1922 to be a furniture year? Is it?

The Earned Hours Plan of Wage Payment

Is It the Fairest Way of Paying for Labor?—Has Advantages Over Ordinary Piece-Rate System—Rates Not Subject to Fluctuations.

By WM. SNAITH, C. E., Associate Engineer, Forest Products Engineering Co., Chicago.

In a previous article we have shown that the piece-work system is fudamentally more just than daywork, and that guesswork must be entirely eliminated from the calculation of piece rates. In practice this means that no rates should be set from past records as obtained from old-time tickets or cost records. Proper time studies with a stop watch in the hands of an experienced observer are the only satisfactory foundations for fair rates.

To rule out cost records as unsuitable data on which to base piece-rates, may occasion a certain amount of surprise. There may be some industries in which the operations are so simple that it would be possible to get cost records down to sufficient detail to be a valuable aid in the calculation of rates, but in most cases such records amount to nothing more than clever approximations, generally close enough for the purposes intended. A few comparisons of actual times required to perform an operation and the time called for by a rate based on proper time study, will convince anyone of this fact. It is the rule, rather than the exception, to find variations of 100 per cent. and on up to over 300 per cent. in the recorded time taken to turn out a given number of parts. Piece rates based on such records will, of course, be equally far astray.

Provides Fair Basis For Payment

It is not our purpose in this article to describe the various ways in which piece rates may be set from time studies. In another article we have outlined one such method based on fundamental principles which, on account of its accuracy and simplicity, is being adopted extensively. For our present purpose we shall assume that our rates are calculated and that we are installing a piece-work system. The next step is to decide on what the method of paying for the work which is to be done. The purpose of this article is to describe the advantages of the "earned hours" plan of wage payment. In several important particulars this method differs from straight piece-work, as that term is commonly understood. At the same time, lest someone might get the impression that an attempt was being made to present piece-work in an attractive disguise, a sugar-coated pill, as it were, let it be said that this is a piece-work system—the fairest way so far devised of paying for labor.

The "earned hours" plan is based on the idea of a certain amount of work being done in an hour. When this work has been performed the worker becomes entitled to an hour's pay. In practice the rates are set so as to contain an incentive varyying from 20 per cent. up. The result is that in eight or nine hours enough work can be done to earn ten or twelve earned hours. It is evident that this still leaves open the question as to how much wages shall be paid for the work in question. There are several very important advantages in this which will become apparent later.

Offers Opportunity For Increased Earnings

Three factors are involved in wages—the amount of work done, the time taken and the price paid. Of these factors, the last, the price or wages per hour, is a matter of bargain between employer and employee We need not here concern ourselves with the economic laws affecting changes in wages. It is enough to point out that, while wages per hour may fluctuate as a result of changing conditions or a new bargain between the two parties concerned, the "earned hours" rates remain unchanged. In other words, an operator agrees to run a certain machine for 50 cents an hour. Under the "earned hours" plan a certain amount of work is decided on as an hour's work and when this is done, the operator is credited with one hour. If the work is actually done in less than an hour, as it will be by an average good operator, he can make use of the remainder to earn a fraction of another hour. In cases where operators, perhaps in learning, come under the quantity set as the hour's work, they are guaranteed their hourly rate. In this respect the plan is a form of bonus system.

There is, however, an important difference between the "earned hours" plan and the elaborate bonus systems of Taylor and the like. It is as easily understood by the worker as by the office man, and there is no reason why each man in a plant accustomed to keeping count of the hours spent in the plant from one pay day to the next.

It is really essential to the success of any system of wage payment that the man who is doing the work shall be put to no trouble to know how much he is to get for doing it. This is not said in disparagement of the excellent bonus systems evolved by F. W. Taylor and others. Those systems cannot be applied in

the furniture business with its relatively small lots and numerous set-ups.

Not Subject To Fluctuation

The rates under the "earned hours" plan are thus seen to be subject to no fluctuations and to be easily understood and figured out. When once the number of pieces that can be planed or shaped or sanded in an hour underspecified conditions, has been properly determined, no change will be made in the rate unless the conditions are changed. If, to secure a finer finish, the feed is slowed down, the rate must be increased and vice versa if the feed is speeded up. These changes would, of course, not effect the actual wages of the operator although the quantity of work done would be changed.

Under straight piece-work every operator gets the same pay for the same work. In this way piece-work is a great leveller. The old employee who has given faithful service for many years gets no more than a new man who may stay but a month or a few days days if they both turn out the same quantity of work. Now, it may be difficult to prove that the old employee in such a case is actually worth more to a firm than the man who is here to-day and gone tomorrow. Yet there is strength in an organization which holds together and works together, and this sort of strength only old, tried and proved workers can give. The advantages may be intangible and in the stress of mushroom expansion may have been lost sight of at times, but it remains and the plant is fortunate where a fair proportion of the workers have grown up with it. In the "earned hours" plan the rate of wages paid to a newcomer need not be the same as that paid to old employees for the same kind of work. He can in all fairness be asked to take less on the understanding that length of service will be rewarded as time goes on. One of the few advantages of the daywork system is thus preserved in this.

Has Desirable Degree of Flexibility

Under straight piece-work an expert worker, a spindle carver, for example, may be temporarily out of work. The only other work available may carry a low piece price which would cut his earnings in two. If the policy of the plant is to do all possible to maintain continuous employment, the spindle carver under the "earned hours" plan would get paid at his regular rate for the hours earned on whatever the other work he was set at happened to be. This again is what would happen with day work. It is true that costs will fluctuate slightly under such conditions, but this will never be serious under normal conditions. As a matter of fact the cost records under any piece-work system are bound to be more accurate than with any other method.

The rates in the "earned hours" plan, being expressed in time only, really are the foundation for production control. It represents a very real economy in management when the one set of time tickets made out by the workers constitute all that is required in the matter of original record by the time-keeping, production and cost department.

The Foremen May Receive Benefits

The "earned hours" plan applies directly to those workers whose operations can be rated. The foremen, of course, cannot be put on piece-work. Now the foremen are the non-commissioned officers of the industrial army and it would be manifestly unfair when the privates are given an opportunity to increase their earnings that this should not be extended to the noncoms. Additional strength is lent this argument by the fact that more than anyone else the foreman can and does train his men so as to make them capable of earning extra pay. The "earned hours" plan is accordingly called on to provide a means to calculate the additional wages of the foremen, and it is found that this can be done very simply and in a very logical way. The time clock hours represent the time spent in the plant by the men in a department. The time tickets show the earned hours for the same period. Dividing the one into the other we obtain a measure of the efficiency of the department or the average extra pay of each man. The foreman's pay is, therefore, increased at the same rate. This may, perhaps, be put even more simply by saying that if the men of a department average 10 per cent. of extra pay, the foreman gets the same percentage added to his salary for the same period. Not only is justice done to the foreman under this method but the efficiency of his department is brought to his attention in a very compelling way and his efforts to build it up are rewarded automatically. A further result is secured in the creation of a healthy rivalry between departments for the best records. The interest in such a contest is not that of a man watching a score board. Each of the contestants is adding to his own pay envelope as he helps to better his own and his department's record. The effect on production need hardly be mentioned.

The "earned hours" plan is then fair to both employer and employee. It embodies the best features of the daywork system and removes the few slight objections to straight piece-work. It simplifies the work of the accountant and gives the management figures and results which lighten the burden carried in these days by those who direct industry.

Makes One Suit Only.

As an example of specialization in the manufacture of furniture, one might cite the case of the Period Cabinet Mfg. Co. of New Albany, Ind. This company was formed originally to manufacture phonograph cabinets, and while producing that line specialized in one cabinet in one wood, attaining a phenominally high production with correspondingly low production costs. When the demand for cabinets eased off, they turned their attention to furniture, and at the present time are producing one dining-room suite consisting of but four pieces. This suite is being placed on the market in two woods, walnut and mahogany, and a choice is being offered between two buffets.

In discussing this question the management of the Period Cabinet Mfg. Co. pointed out three primary advantages accruing from centring their efforts on the production of one suite. First—Increased efficiency of labor. The workman performs one operation on one size and shape all day long, a condition which materially increases his speed and skill. He does not become accustomed to one operation, only to be thrown off the track by having to change to another. Again, there is no loss of time while adjusting the machine to different sizes of work. Second—The floor space of the factory is used to its fullest capacity as the work moves along from one operation to another in a steady stream instead of being permitted to stand around occupying valuable space. Third—A saving is made in the amount of money tied up, as it is not necessary to keep large and varied stocks on hand to meet the demands which would be made were a varied line to be produced.

Wood Waste Receiving Special Attention

Special Section Formed at Forest Products Laboratory—Requirements of Chair and Wood Turning Industries to Receive Special Attention—Outline of Considerations Involved.

By ARTHUR T. UPSON, Forest Products Labratory, Madison, Wis.

"Industrial Investigation" is the name of a section recently organized at the Forest Products Laboratory, Madison, Wisconsin, to conduct a technical study on the efficiency of wood conversion processes with the idea of aiding in a more effective utilization of wood. In this connection a systematic survey will be made to determine the possibilities of a more complete utilization of by-products, low-grade material and wood waste produced in the logging and manufacturing of timber and in the manufacturing of wooden articles.

One of the first steps in this direction was the formation of a Wood Waste Exchange. The idea behind this is to supply a medium through which producers can locate markets for wood, mill and factory waste, and through which wood-consuming plants can locate such material of this character as will meet their requirements. The aim is to acquaint producers and consumers of waste material of one another's needs through quarterly reports. One report is entitled "Opportunities to Buy Waste," and contains the names and addresses of organizations which have marketable wastes for sale, while another report is called "Opportunities to Sell Waste," and gives the names and addresses plants which desire to buy all or a portion of their raw material in the form of waste.

Attempt to Standardize Requirements

Working in close touch with the Standardization Committee of the Association of Wood-using Industries considerable attention is to be devoted to a study of the dimension stock problem with the following specific purposes in view:—

1. To standardize the small dimension stock requirements of secondary wood-using industries.
2. To determine the most economical methods of converting the standing tree into the form of material required by these industries.
3. To accomplish the acceptance of these standardized dimensions requirements by the manufacturers of lumber and dimension stock and by consumer of such products.
4. To establish stable, continuous markets for dimension stock standardized in respect to nomanclature, size, grade and specification.

In order to concentrate this work as much as possible, activities are to be confined to not over two industries at a time. The two selected for the initial study are the chair and wood-turing groups. One reason why these two groups were chosen is that the requirements of both industries are of such a character as to lend themselves to standardization of requirements of wood stock and to the increased utilization of dimension stock in these industries.

Point to be Solved

The problem then resolves itself into individual studies of following character:—

1. Collection and compilation of data on the sizes and kinds of wood stock required in the manufacture of chairs of all general styles and in wood turning, and the standardization of these requirements by sizes and species.

2. Determination of the consumption of such stock, by sizes and species, in the chair and wood turning industries.

3. Detailed studies at representative chair and wood turning plants to obtain data on:

a. Cost of remanufacture of lumber into the dimension stock required, by species, by grades of lumber, by sizes of dimension, by purpose of stock.

b. Loss of material in such remanufacture, by species divided separately into waste in saw kerf, unavoidable waste due to natural defects, and avoidable waste due to artificial defects caused by improper handling and careless lumber manufacture, and to the use of lumber of sizes unsuitable to the manufacture of the dimension sizes in question.

4. Detailed studies at representative lumber manufacturing plants to obtain data on:

a. Cost of manufacture of lumber of the species and grades for the production of dimension stock similar to that studied as outlined under 3a.

b. Loss of material in such manufacture by species divided separately into waste in saw kerf, and in slabs, edgings, and trimmings combined.

c. Percentage of various grades of lumber produced, by species.

d. Approximate data on the amount of material wasted in slabs, edgings, and trimmings which is suitable for the manufacture of dimension stock, by species.

e. Cost of remanufacture of No. 2 and No. 3 common lumber into dimension stock, by species, and determination of the minimum grade which can be more profitably marketed as lumber than in the form of remanufactured dimension stock.

5. Detailed studies at representative chair and wood turning plants manufacturing dimension direct from the log and at mills manufacturing dimension for the market to obtain data on:

a. Cost of manufacture of dimension stock, by species and by grades, direct from logs, slabs, edging, etc.

b. Loss of material in such manufacture, by species, divided separately into waste in saw kerf, and in slabs, edgings, and trimmings combined.

6. Detailed studies at representative dimension mills to obtain data on the cost and most economical method of:

a. Handling dimension stock from the saw.

b. Sorting dimension stock separately as to species, sizes, and grades.

C. Handling dimension stock from sorting room to yard, kiln, or car.

d. Piling dimension stock for air drying and in kilns, by sizes and by species.

e. Air seasoning and kiln drying dimension stock.

f. Kiln drying at mills vs. facories.

7. Compilation of list of present mills producing dimension stock including data on the:

a. Name of owner and location of mill.

b. Amount of stock produced annually.

c. Species.

d. Condition of stock, i. e., green, air dried, or kiln dried.

e. Material from which manufactured.

Certain other studies must be conducted later on to bring about the complete solution of the problem, but they cannot be handled the present fiscal year.

In this work the Forest Products Laboratory earnestly solicits the closest co-operation of all wood-turners and chair manufacturers, in order that results will be obtained of greatest mutual benefit to both industries, as well as to the public in the light of progress in forest conservation.

Exhaust Systems for Woodworking Plants

What a Shavings Exhaust Should do—Will Make Handsome Returns if Properly Designed—Air Velocities for Planing Mill Work—Many Nice Problems Involved.

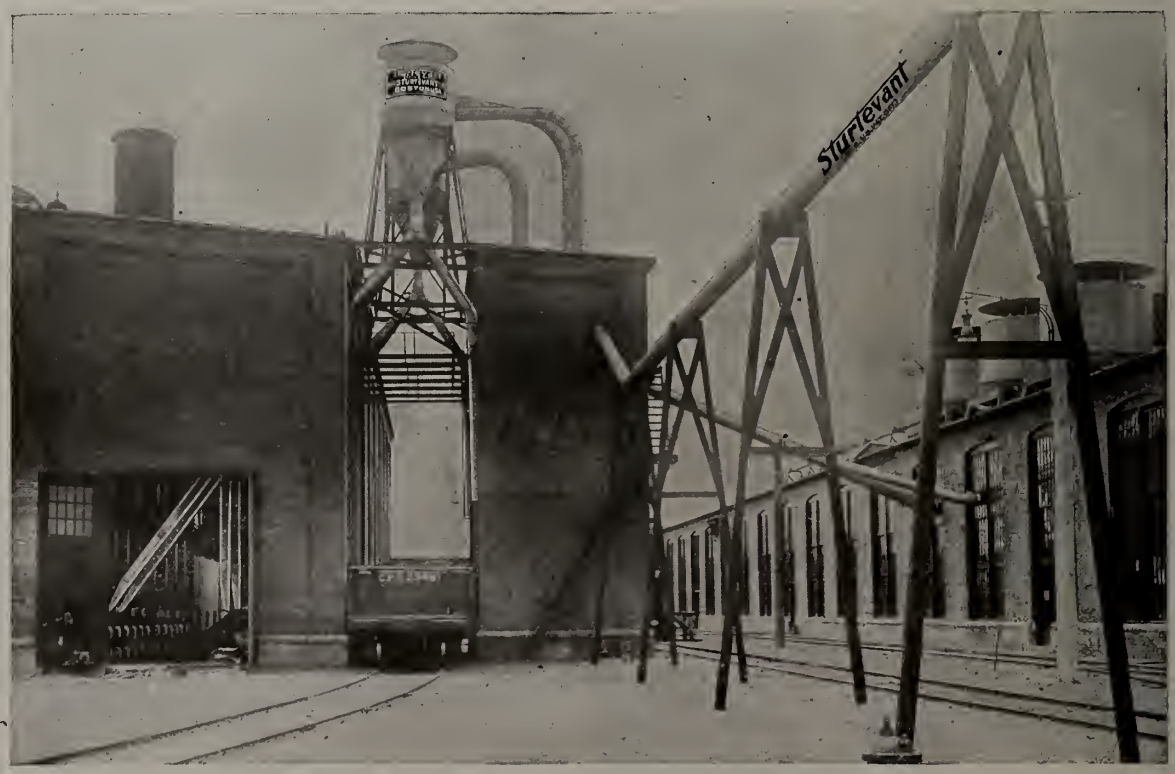
By H. M. Nichols, B. F. Sturtevant Company, Boston.

The first practical application of an exhaust fan to the collecting and conveying of dust and refuse materials was made in the early sixties and was the outcome of a shoe buffing machine invented by B. F. Sturtevant. Such a cloud of dust was stirred up when this buffing machine was in operation that the workmen complained and objected to its use. Mr. Sturtevant in his search for a remedy for this condition built a small exhaust fan which he connected to the buffing wheels by means of a sheet metal hood. He found that this exhaust fan drew away the particles of leather and left the air in the room clean and healthful, and thus came into being the first satisfactory exhaust system, and the father of all the exhaust systems in use to-day.

In wood-working plants a properly designed and well installed exhaust or "blow-pipe" system as it is often called, not only adds to the comfort and safety of the workmen but it can actually be made to pay the manufacturer large dividends on its cost. Modern high speed wood-working machines produce such tremendous quantities of shavings, chips, and sawdust that unless this waste material is removed by a suction system, as fast as it is made, it soon clutters up the machines and surrounding floor space, thus necessitating frequent stops to clean the machines and clear away the piles of refuse.

Will Return Nice Dividends

Eliminating this labor item and increasing production through continuous operation of the machines are two of the dividends which the manufacturer obtains from an efficient exhaust system. Also where there is a market for either shavings or sawdust the collector can be arranged to automatically separate these materials so they can be sold. And if there is no market for the refuse it can be automatically delivered to the boilers and used in place of coal for fuel. Then again unless this light and bulky refuse is removed from the building as fast as produced it constitutes an ever present and menacing fire hazard. Ac-



Dust Collectors and Furnace Feeders at Angus Shops of C. P. R., Montreal. Collectors in the center deliver shavings either to furnaces, box cars, or storage vaults

cidents are reduced by keeping the floors and working spaces clear of litter, by preventing injuries from flying chips, and by avoiding the necessity of cleaning the machines while in operation. The removal of the dust which is always irritating and sometimes poisonous, improves the health, efficiency and production of the workers.. Insurance premiums, both fire and liability, are reduced where cleanliness prevails.

However, for the exhaust system to show these marked advantages in the wood-working shop, it must satisfy a much more exacting set of requirements than the ordinary dust collecting system, as it must not only remove the light dust as required of the common dust system, but it must also carry away the vast quantity of chips and shavings which are discharged in steady streams by the rapidly revolving cutters, and any faiure to handle these streams of refuse as fast as they are thrown from the knives results in the immediate stoppage of the part of the system at fault.

Points to Consider

In addition to handling the refuse material without interruption, a properly designed exhaust system should also fulfill the following requirements:—

(1) It should not interfere with the operation of the machine or access to working parts.

(2) Hoods and piping should not obstruct the room or interfere with the movements of the workmen.

(3) Should not increase the fire risk.

(4) Where power is costly should do the work with a minimum amount of power.

(5) In cold climates should not remove any more air than necessary from the building.

(6) Where power is cheap first cost should be low, even if the power to operate is slightly higher.

There are two general types of installations, the central and the group systems. In the central system a single or double fan is located near the center of the shop with a piping system radiating from this central point to the wood-working machines. In the group system, which is sometimes employed where the machines to be served are widely scattered, small individual fans are located at the center of the machine groups. The exhaust from the various fans usually being conducted to a single collector.

The group arrangement is more difficult to balance than the central, and also the large number of small diameter trunk pipes required show a much higher friction loss per foot of length than with the central system where one large main pipe serves a considerable number of machines.

Many Special Problems Involved

Each installation of a shavings and sawdust collecting system presents special problems. Certain quantities must be chosen arbitrarily by the designer and the success of the installation depends largely on his experience and the skill with which he chooses these arbitrary quantities. It is quite possible for an inexperienced designer to lay out a system which will apparently work properly, but the general results are likely to be unsatisfactory.

Before attempting to lay out a system of this kind it is necessary to have a clear understanding of the requirements of the particular shop in question, i. e. it is necessary to know the type of shop, the class of work which they are doing, kind of lumber handled, as well as the sizes, types, capacities and location of the machines, also whether the refuse material will be burned in the furnaces or separated and sold, and whether the system is to be designed for minimum power consumption or minimum first cost, as well as many other factors, which usually requires that a study be made in the field in order to determine all these points.

After obtaining a clear understanding of the requirements of the particular job in question the next step in laying out the system is to determine the number and size of connections for each individual machine. At this point the designer's past experience is of great value, as while it is possible to set certain general standards, yet in actual practice the sizes are considerably affected by the local conditions which the layout man finds in the field, and he bases the pipe sizes on his judgment being guided by his experience and the general practice. The size of connections will vary with the quantity of shavings made, kind of lumber, its condition, whether wet or dry, speed of the cutter heads, etc. and while we can give a table of connections which are often used, yet experience will best dictate just what sizes are best for a given job.

Dust collector, showing dual feed, R. Laidlaw Lumber Co., Toronto. Installed by Toronto Blower Co.

The main pipes, which vary in diameter, increasing from the dead ends towards the fan, are usually made of such size that the area at any point will be 20 to 25% in excess of the sum of the areas of the branches entering between the point in question and the dead ends of the mains. Floor sweeps, if equipped with efficient blast gates, are not included in determining this area.

Velocities Commonly Employed

Another method of determining the size of the main trunks is to figure them such as to keep a given air velocity through their length. In planing mill work velocities from 2500 to 5000 feet per minute are used. Velocities commonly employed are:

Light shavings and sawdust from dry wood 2500 to 3000 feet per minute.

Heavy shavings and sawdust from wet wood 3000 to 4000 feet per minute.

Hog waste, pulp chips and similar materials 4000 to 5000 feet per minute.

Treatment of Depreciation in Production

Not Considered by Many Manufacturers—Will Take Toll of Profits Unless Provision is Made—Should be included in Factory Costs

By E. W. McCULLOUGH, Manager, Fabricated Production Department, Chamber of Commerce, Wash.

These facts concerning depreciation are still reflected on the books of many manufacturers: (1) Depreciation not charged, or charged inconsistently (2) Depreciation not taken into current, every-day costs. (3) A confusion of different points of view; depreciation for cost and accounting purposes confused with possible realization and replacement values. (4) Wear and tear hastened by inadequate maintenance and careless shop practices.
(5) The effect of obsolescence underestimated. (6) Depreciation computed by rule-of-thumb rates regardless of the experiences of plant or industry. (7) Depreciation poorly accounted for; the reserve for depreciation misused, general failure to distinguish repairs from betterments and renewals. (8) Depreciation inadequately recorded, little segregation or classification of property, the property ledger used sparingly.

Depreciation attempts to measure the effect of time and production on physical properties and equipment and to record results in dollars and cents. This computation cannot be exact because the elements affecting depreciation are many and their relative importance difficult to determne. The use and character of property, its maintenance, the quality of installation, and often local conditions variously modify the life of property, while an unexpected industrial advance may suddenly terminate the usefulness of property and completely upset depreciation calculations.

Cannot Be Avoided

One fact concerning depreciation is certain—it can be postponed but not ultimately avoided. All your plant and equipment suffer from and finally succumb to depreciation. To the end that this loss may be reasonably controlled and fully reclaimed in manufacturing costs this study of depreciation is directed.

Depreciation is an inescapable cost of doing business to be provided for by a regular charge to current operations. Every thousand of brick produced, every case of shoes manufactured, every fashioning of metal and turning of wood, each twist of the handle and blow of the hammer helps to wear out your plant and equipment, and the particular job or process that causes this loss should bear the cost.

Analyze the costs of almost any group of manufacturers marketing the same product and you will detect two kinds of differences; one real, the other accidental. Real differences in cost arise from superior management, higher productivity and better disposition and utilization of capital, etc. Such differences are the very breath and life of business.

The accidental differences are due to the failure on the part of manufacturers to include all the proper and legitimate items of expense in costs, an improper distribution of overhead, etc., and differences of this nature make for business unsettlement. One such accidental difference in costs most frequently found arises where manufacturers do not charge depreciation at all or leave depreciation to be dealt with at the end of the year.

May Absorb Profits If Not Recognized

The business man who does not charge depreciation at all is fooling himself. He is making no provision for the inevitable day when his property must be scrapped. His supposed profits may in fact be a distribution of his capital.

The business man who waits until the end of the year to detrmine his depreciation according to the size of his profits may make the discovery that he has no profits, since he has consistently sold his product upon a cost that was incorrect.—a cost that did not include such a necessary expense of manufacture as depreciation.

The competition of the future should be an informed competition. The basis of lower prices should be a greater efficiency, not incomplete costs. To that end, everything that goes through your factory should bear its proportional cost of depreciation. Charge depreciation into current costs.

Is Not Resale Value

Depreciation for cost purposes is not concerned with resale or replacement values but aims to recover the cost of assets, less any salvage. The need arises from the fact that working assets gradually give out or become obsolete. They are, in fact, used up in production. Were the assets consumed in any one year their entire cost would be written off during that year, but the process of depreciation is slow, usually extending over a period of years. Hence it is unfair to charge off all the cost in any one year.

It is frequently declared that the moment a machine or piece of equipment enters a plant it becomes second-hand and at once loses a considerable share of the original cost, and it is asserted that this loss of value should be reflected on the books by a sizeable first charge for depreciation. But we are not concerned primarily with what property will bring, its resale value, but how property is used up. The test for depreciation is how long the property will function, how many units it will produce before scrapping time. Just as the meter notes the flow of current, so depreciation seeks to register in costs the gradual loss of usefulness of plant and equipment. This loss of usefulness is an inc dent of time and service and is unaffected by the rise or fall of prices or the possible loss in resale value after purchase.

When the cost of an asset, less any salvage value has been recovered, the process of depreciation stops —the consumer has paid for that particular item of service. There are those who maintain that the obligation of the consumer is rather one of replacement —building for building, machine for machine. According to this view depreciation should be based on replacement cost rather than actual cost.

Replacement Value Next Factor

The replacement theory substitutes for something certain and definite, the actual cost, a cost of reproduction which is highly speculative and conjectural and requiring frequent revision. It, moreover, seeks to estblish for one expense a basis of computation

fundamentally different from that used for the other expenses of doing business. Insurance is charged on a basis of actual premiums paid, not on the basis of probable premiums three years hence; rent on the amount actually paid, not on the problematical rate of the next lease; salaries, light, heat, power, supplies are all charged at actual, not upon a future contingent, cost.

As one writer has expressed it, "The fact that the plant cannot be replaced at the same cost, but only at much more, has nothing to do with the cost of its product, but only with the cost of future product turned out by the subsequent plant." As the product goes through your factory it should be burdened with expired, not anticipated, costs.

Charge depreciation upon actual cost less any salvage. Resale and replacement values have uses of their own. Stockholders may desire to know what can be realized on plant and equipment upon liquidation, and for such the resale value of the assets is important information. Replacement costs govern the settlement of fire losses, for the contract of fire loss is one of indemnity. Neither original costs nor the accountant's depreciation govern settlement. Indemnity is determined by the actual cash value of the property at the time of the fire, with proper deduction for depreciation however caused.

Is Only An Estimate

But the depreciation must have materialized irrespective of any provision on the books of the company. In setting his charge for depreciation the accountant may allow for a factor of obsolescence which may not develope by the time of the fire or he may assume an even and uniform loss from wear and tear over a period of years or upon an incidence of production, whereas the actual wear and tear may be uneven and unexpected, slower or more rapid. This state of facts has led a writer on depreciation, in reviewing the relationship of depreciation to fire losses, to state:

"Depreciation is after all but an estimate of what may be necessary to meet contingencies, some of them of a speculative kind, and as the losses provided against may have been escaped, a review of all the circumstances so far as they can be ascertained may show a higher value than is stated in accounts drawn up for a different purpose; and, again, where plant has been regularly written down, it does not follow that only the value as so lessened can be claimed (in a fire loss).

Depreciation and Fire Insurance

As an outgrowth of this study of depreciation an attempt has been made to ascertain the attitude, general theory and rule of fire insurance companies toward depreciation, also to learn what weight was given to reserves for depreciation accumulated on the books of the assured, whether there was a wide recognition of the fact that depreciation is charged for contingencies which may or may not have taken place at a given time; for example, that obsolescence provided for may not have been realized.

The results of this inquiry are not conclusive. There is some confusion of thought and some actual differences in practice, but the following is fairly clear and certain concerning the attitude of fire insurance companies toward depreciation.

The provision of a Standard Fire Insurance Policy under which the right to "Depreciation" is exercised, is as follows:

"This policy shall not be liable beyond the actual cash value of the property at the time any loss or damage occurs, and the loss or damage shall be ascertained or estimated according to such actual cash value, with proper deduction for depreciation however caused, and shall in no event exceed what it would then cost the insured to repair or replace the same with material of like kind and quality."

"The obvious purpose," to quote an insurance adjuster, "of the contract of insurance is indemnity regardless of the loss of time, of inconvenience, of annoyance, or consequential injury or damage to the business of the assured."

(Continued in December issue)

How Much Should This Sash Cost?

Test Submitted to Number of Woodworkers Reveals Startling Condition—No Wonder General Public Views Woodwork Prices with Uncertainty

When will the woodworking industry get down to some nearly uniform basis on which to make estimates and quotations? Competitive bids are taken on a job and as a rule the figgures submitted show a substantial variation, the order usually going to the lowest tenderer. Of those who quoted, some guess that the successful bidder is going to lose money, while, perhaps, a few know that he accepted the order at too low a figure, and all remain more or less in the dark.

A member of the Southern Sash, Door & Millwork Manufacturers' Association recently submitted cost figures covering a store sash he had made to order, sketch of which is shown in the accompanying illustration. C. B. Harman, secretary of the above Association, immediately asked his membership to submit their estimates of cost and labor on the job in question. He received thirty-two replies and the variations in the estimates submitted would appear to indicate that there is too much "guessing" and not enough "knowing" and that guessing is a poor substitute for scientific estimating.

Mr. Harman's report is as follows:—One store sash, 8 ft. 6in. x 12 ft. 8 in. x 1¾ in. OPEN—3 lights top with panel at bottom as per detail submitted. Made of heart yellow pine or heart cypress. The member who made and sold this sash has given me the following cost, made of heart pine.

63½ ft. Lumber	$2.88
Machine Labor and Burden 4.4 hours	5.32
Bench Labor and Burden 4.8 hours	4.08
Factory Cost	12.28
Commercial Burden 15%	1.84
Actual Cost	$14.12

He took the order on time and material basis and charged $16.50 for it, giving him a profit of $2.38 or

16.8%. He doesn't seem to have added anything for waste of lumber as the price figured for lumber is slightly under $47.00 per M and we don't know where heart pine lumber suitable for the purpose can be bought at that figure.

Of the estimates made on the sash, O. P. Makepeace of Sanford Sash & Blind Co., Sanford, N.C., has turned in the closest figure nearest the cost. His figure is $14.18, just .06 cents more than the cost. C. R. Preddy of Builders Sash & Door Co., Rocky Mount, N. C., comes nearest to the amount of labor repuired, he estimates 9 hours when it took 9 1/5 hours.

And now come the fireworks, a very remarkable showing, you will admit:

LIST OF ESTIMATES TURNED IN.

Factory	Cost	Labor
1	$30.50	13 hrs.
2	26.00	12 hrs.
3	23.65	12 hrs.
4	23.40	10 hrs.
5	22.20	9½ hrs.
6	22.18	7 2/3 hrs.
7	21.10	6¾ hrs.
8	20.06	4½ hrs.
9	19.55	10½ hrs.
10	18.08	7 hrs.
11	17.70	5½ hrs.
12	15.99	8 hrs.
13	15.75	3¼ hrs.
14	14.18	5 hrs.
15	13.65	10 hrs.
16	13.30	6 hrs.
17	13.29	5 8/10 hrs.
18	12.98	9 hrs.
19	12.85	9 hrs.
20	12.28	6½ hrs.
21	12.06	6 hrs.
22	11.10	3½ hrs.
23	11.06	3 hrs.
24	11.06	5 hrs.
25	11.88	4½ hrs.
26	11.91	5 hrs.
27	10.90	4¼ hrs.
28	10.54	6 4/10 hrs.
29	9.60	5 hrs.
30	8.52	6 hrs.
31	8.34	2 hrs.
32	5.70	4 hrs.

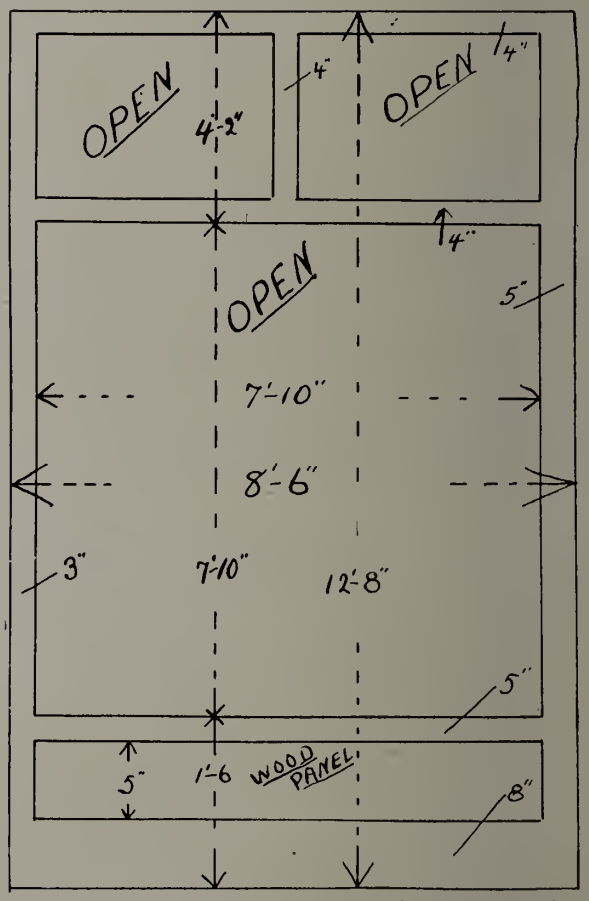
If this means anything at all, it is that there are very few who can estimate the amount of labor with any degree of certainty or accuracy. It will be noted that only 8 men have figured sufficient labor, all the other 24 have underestimated. Note also that the price runs from $5.70 to $30.50. Could this occur if we "knew our business" or were better posted about our labor? One man figures 2 hours and another 13 hours; my, my, men! the old well digger who used to find where the water was with a peach tree switch could beat us "all holler."

We didn't expect everybody to figure the same price for we knew that was impossible, but we are amazed at these very large and wide differences. What would a customer think and feel, who had paid $30.50 for the sash if he found that he could have sent down to Georgia and got it for $5.70? It wouldn't put a very good taste in his mouth. This test should show and convince you that the method of guessing or approximating labor was impossible and that present conditions will never be better until you keep cost and fill up your files with records to refer to quickly.

Labor is the most dangerous element we have to contend with as your accountants and auditors or others who are familiar with the millwork and lumber business can easily figure what your burdens or overhead expenses are.

Now, the factory that made the sash is only a medium size one and in writing he admits that many of our other factories might have produced the sash more cheaply and that his men made a slight error in mortising, but that does not explain the ridiculous situation presented to us through the foregoing exposition of cost and labor by 32 different men.

Its no reflection on an estimator's ability when he takes sufficient time to figure the cost of anything—these "lightning" or fast putting down figures men are dangerous and mean big losses to many times when you never know anything of it and often times put you in the position of charging your customers altogether too much. It is more practical and better business to take half an hour to make up the list at a cost of from $1.00 to $2.00, than to lose two, three



Sketch of store sash on which quotations were asked

or four times that much on the sale price, or to overcharge your customer beyond reason.

The "Canadian Woodworker" submitted the same question to a number of woodworkers in Canada but the response was not general enough upon which to base any conclusions. Three replies were received and naturally there was the usual variation. One estimated $10.35 allowing 2½ hours work. Another figured $13.20 with 3½ hours while the third submitted $17.80 and 6 hours.

How a Construction Revival Can Relieve Unemployment

A Memorandum Submitted to the Recent Unemployment Conference Held at Washington, D. C., Analyzes the Present Building Situation and Suggests Measures to Keep Things Moving

By R. C. MARSHALL, General Manager, Associated General Contractors of America

In the present situation the well-known slogan "build public works in times of depression" is again advocated, and this principle should be carefully investigated, to determine its possibilities as a remedy for unemployment. If construction in conjunction with other measures is advisable, the ground should be cleared for putting it under way. But before such action can be successfully carried out, the co-operation of public officials, industrial leaders, and the public at large must be secured. This means that they must see exactly how construction is able to give relief.

To show the feasibility of starting industrial recovery and giving employment by inaugurating construction (both public and private work), an analysis of the five fundamental factors is prsented. They are:

1. Dependence of other industries upon construction for a market.
2. Present shortage and the demand for construction.
3. Capacity to increase employment.
4. Causes delaying construction.
5. Steps necessary to revive construction.

The factors vitally affecting the present unemployment emergency are here briefly outlined.

Dependence of Other Industries

Construction holds the position of a key industry through which the products of some forty other industries find their way to a consumer, and the innumerable items of materials and equipment produced by them converge to a narrow outlet, governed by construction operations. Therefore, when these operations are stopped they block the outlet for hundreds of products and intensify in the basic industries the effect of unemployment.

Steel and lumber production especially suffer when construction becomes stagnant. Before either of these can again give employment to the usual number of men, orders for structural members, lumber and other products used in the many branches of construction must be received. This principle acts also in all of the 40 basic industries, and in these industries more than in construction itself, the capacity to provide employment lies.

Present Shortage of Construction

There is a potential demand for both private and public works, which can by proper action be converted into a commercial demand for materials and labor, a value upon which has been placed by numerous agencies. Reliable statistics for such estimates are meager, but the main items of these various estimates show close agreement. The need for mercantile and industrial buildings which is obviously synchronized with the trade cycle is low. But the requirements of housing, public utilities, and various types of public works undoubtedly need an intensified building program for several years to come. The railways, according to Mr. E. H. Harriman's estimate some years ago, lacked construction to the amount of five billions, practically none of which has yet been attempted. An immense expenditure represents the needs of our public utilities, and according to the plans laid for highway development, a vast amount is needed for public roads.

Capacity to Increase Employment

The number of employes in the basic industries engaged in producing construction materials, products and equipment was recently estimated by the United States Chamber of Commerce to be one-fourth of the employes engaged in manufacturing and mechanical work. Probably one-eighth of those in mining and transportation also depend upon construction. If these figures, commonly accepted in the absence of accurate statistics, are correct, the ratio between labor in the basic industries and in construction is about two and one-half to one. This indicates that when two men are set to work in the field, seven men are employed in the whole construction group.

In the present emergency not only the number of men, but also the time required to place them at work, is important. For an estimate of this we can rely only upon the judgment of men experienced in construction operations.

Seasonal considerations and the lack of preparation in matters of design and plans make it impossible to start immediately all work for which public appropriations have been provided. But if a major part of this work is started in November, if this conference can influence private agencies also to start work by then, it is estimated that within 90 days employment could be found for nearly a million men.

[This, of course, applies to the U. S.—Editor.]

Both private and public work have been delayed primarily on account of high construction cost. This cost has been brought about, not only by advance cost of labor and material, but also by increased freight rates and heavy financial charges.

Labor and Materials

Government index building material prices reached a level of 341 in 1920, while construction labor advanced to the index of approximately 230. Comprehensive figures are not available, but both of these are believed now to be in the neighborhood of 160, though union labor is higher. It should be remembered, however, in considering these index numbers, that prices were steadily increasing before the war at the rate of 2½ per cent. a year and would probably have landed without the war at what is now 120. The present level is, therefore, some 40 points above what we would choose to designate a normal. The index of finished construction, as indicated by industrial buildings, stood between 160 and 170 in July, and is now between 150 and 160. The index curve has stopped its descent and immediate deflation is apparently at an end.

It should be noted that wages have kept in step with

the per capita increase of money. Whether this relation must necessarily continue is a mooted question, but as the present per capita wealth is some 60 per cent. above that of 1914, it appears that a wage level of 160, as predicted over a year ago by one economist, is at a stabilizing point. In any event, upon this index principally depends any great reduction of cost. Any saving that might be made by lower labor and materials cost will undoubtedly be insignificant compared with the expense of any system of charity or doles that might be necessitated by further postponement of work.

If construction is delayed until producers in the basic industries are driven out, recurrence of the situation of 1920 may be expected. The supply of material will be so slow that prices may move rapidly upward when revival does take place. We shall doubtless be forced to look outside the field of actual labor and materials cost to find a means of bringing about the immediate reduction which will influence the demand for construction in the present emergency.

Freight Rates

Freight rates on bulky construction materials are a significant factor of increased costs. Their present level has not altogether discouraged shipping and construction, but has in some localities practically killed the aggregate market. Rate discrimination against construction materials was made by the Railway Administration during the war, and on top of its purposely prohibitory rates the last horizontal increase was added. These rates have placed the transportation cost of materials on an 18-ft. concrete highway as high as $11,000 per mile. In specific localities the rates are as much as 129 per cent. above the 1917 charges. They are unduly keeping up the cost of construction and preventing its revival.

Financing Charges

In every section of the country owners have declined to start new projects on account of financing charges. Both the interest rate and the premium paid for floating loans are discouragingly high. Premiums for floating loans, varying between 10 and 20 per cent., are charged in addition to 7 or 8 per cent. interest. For example, before the first work of construction was begun, the owners on a well-known Washington apartment house were required to pay for the $1,250,000 involved an interest rate of 7 per cent., a bond premium of 1½ per cent. and a floating charge of 10 per cent., making the total financing charges 18½ per cent. Financing charges on a subsequent loan of $250,000 for the same structure were $75,000. This is a charge of 30 per cent. It is doubtful whether the architect, the contractor and the producers in the basic industries made a profit all combined equal to these financing charges. When an owner must pay such a sum before construction even starts, many projects are postponed or abandoned. Before private work can proceed as needed, some relief from conditions must be secured.

Steps for Reviving Construction

Certain direct action which will open up employment through construction can be taken by the government, while through regulatory action and example it can both stimulate the demand for construction and influence other agencies to act. The following steps to bring about activity in both private and public works are suggested:

(a) Place under construction as soon as possible all federal public work for which appropriations are already made, at the same time urging state, county and municipal bodies to do likewise. In doing this the federal authorities should adhere to existing precedents for administering public works, especially public roads. The efficiency and ability of the bureau of public roads, which have been thoroughly demonstrated and have secured the confidence and co-operation of the states, must not be wasted by vesting construction administration in some other agency. Economical road building requires the specialized engineering ability now centralized in the bureau of public roads.

(b) Enact any necessary appropriations that are already contemplated.

(c) Establish some form of home loan agency, possibly using the postal savings funds, to furnish money at reasonable rates for housing construction, making it possible for the agency to co-operate financially with reliable building and loan associations. Financiers will not turn from attractive foreign loans to place money in construction at lower rates of interest.

(d) Adjust any freight rates on materials that are eliminating markets or causing unreasonable charges on construction materials.

(e) Make payments of claims due the railways and settle other existing claims so that these agencies can undertake immediate improvement and new work.

(f) Push investigations of unlawful or injurious combinations and agreements in finance, building and materials production.

(g) Encourage private agencies by tax exemption to start their projects in the near future; this plan advocated by Senator Calder proved successful in increasing housing facilities in New York. Also advocate drawing contracts to give such owners the benefit of price reduction.

(h) Place the federal power commission in a state to function properly so that private power prospects can be passed upon and put under way.

The factors here mentioned are viewed from the standpoint of construction, and obviously any action pertaining to them must be taken with due consideration for the entire economic situation. We know, for instance, that the railroads must be allowed to rehabilitate themselves and that to do so they must operate at a profit. But in the event that stimulation of construction, either private or public, is brought about by this unemployment conference, such stimulation may be relied upon to aid effectively the present situation.

However, before artificial stimulation is attempted, one vital contingency must be taken into account. This is the effect of sudden expansion upon construction material prices. Unless constructors, material producers and labor are willing in this emergency to accept reasonable profit and reasonable wages, any intensified construction program may end in disaster. If the supply and demand for construction service, materials and labor are permitted to constitute the sole governor of prices, a situation analogous to that of 1920 may reoccur. Since we cannot and should not attempt to arbitrarily regulate prices, assurance of reasonable prices must come from two sources. These are first, the far-sightedness of industrial leaders who know the ultimate benefit of steady prices, wages and markets; and second, the force of public opinion. It is with these considerations in mind that stimulation of construction is recommended.

Not Much Chance of a Fire in This Plant

Outline of Measures and Precautions Taken to Prevent Outbreak of Fire—Cleanliness Important Factor — Fire insurance Inspector Pronounces Factory Cleanest in District.

By W. WARREN

Fire protection is assuredly of first importance, especially so to the owner of large stocks of inflammable material, such as lumber. As manager of a large retail lumber yard, mill and woodworking factory, I have been compelled to make a careful study of the causes of fires, and the most practical way to institute preventative measures. Prevention is better than cure.

It is not possible to remove all and every contributary cause, but it is possible to reduce them to a minimum. Ther are few conditions so admirably adapted to the general requirements of a conflagration as a lumber yard covering ten acres and containing 10,000,000 ft. of lumber, with all the requisite buildings filled with very inflammable material.

Have Efficiently Trained Squad

We have a very efficient fire squad under the leadership of our factory superintendent. It is a body of some fifteen carefully hand-picked men, well trained and noted for their efficiency and loyalty, and whilst these men are qualified fire fighters, every opportunity is used to instill into their minds that the proper time to fight a fire is before it starts. These men being drafted from all departments, their influence is felt throughout our whole organization and so all our employees automatically become fire preventers. Let me say in passing that no manager or executive head can effectively control a situation of such vital importance as fire prevention unless he seeks the assistance of his whole staff and gives due credit for same.

We can and do supply numerous devices calculated to put out a fire, and we flatter ourselves that our equipment is fairly complete, but all this paraphernalia without the necessary prevention, effectively and rigidly adhered to, will benefit very little.

Cleanliness First Requisite

Fire in a lumber yard is the most devastating demon that can possibly visit it. A yard should be laid out so that no blind ends exist, every lumber pile should be easily accessible and roads and alleys clean at all times, so that reel and trucks can reach any desired position. Any material left standing on any of our roads will be found on carts, trucks or wagons. Nothing is allowed to be stacked, or piled down where a blockade may occur. An infringement of this rule results in the dismissal of the responsible party.

Cleanliness is one of the most powerful factors in fire prevention. No papers, dead or dried grass, weeds or shavings, are allowed to remain within the precincts of the yard. A capable caretaker, whose duties are solely that of a clean-up man, is kept continually gathering up grass, straw, strips, paper or any other inflammable refuse.

At convenient points high pressure hydrants have been placed, with lines of hose capable of reaching any position around the yard. Barrels and buckets are placed in conspicuous places, whilst parts not supplied thus are equipped with approved chemical extinguishers. The watchman's stations, phones and general fire alarm signals are placed in very prominent places. Care is taken to leave all automobiles and trucks clear of lumber piles.

Special Hazard in Mill and Factory

The mill and factory call for somewhat different treatment and special care. There is at all times the possibility of hot boxes, sparks, short circuits, spontaneous combustion, etc. Here, as in the yard, cleanliness is the biggest factor in fire prevention. It is impossible to keep a factory or mill clean unless it is equipped with an up-to-date blower system, thereby removing all sawdust and shavings, delivering them either to the boilers or shaving vault.

Competent clean-up men are very necessary, and only men with housekeeping qualifications should be employed for this purpose. No refuse should be allowed to remain on a factory floor over night. Oil from line shaft, pulleys, motors, etc., may mingle with the sawdust or small shavings, thereby setting up spontaneous combustion. Statistics show that a large percentage of fires start from this cause. In our factory the clean-up man's work is even more carefully inspected than the orders passing through the plant. Let me state in passing that the fire insurance inspector has pronounced our plant the cleanest in his jurisdiction.

Oil Soaked Shavings Removed Daily

We exercise especial care in cleaning machines of all dirt, grease, and oil, and under no circumstances is an accumulation of this combustible refuse allowed to collect under a machine. I once experienced a fire started by the sun playing on oily sawdust gathered under a machine. In the event of a bearing becoming over-heated, it is duly reported to the nightwatchman, who inspects same at short intervals until all danger is passed. As in the yard we do not allow any material to be stacked on the floor, but all stock kept on factory trucks until ready for shipment. In the event of an outbreak, the affected area can be cleared quickly.

One of the most dangerous practices is that of having racks placed around the factory. Once a fire commences to travel through a rack filled with inflammable strips, the building is practically doomed. It is next to impossible to check it. All supplies, such as moulding, rippings, etc., should be removed into a closed room adjacent to the plant, where the chances of a fire are remote, and where, if one did break out, it could be localized.

Mechanical Equipment Not Overlooked

Our mill and factory fire protection consists of a sprinkler system, 4 lines of hose capable of reaching any part of the building, several water barrels, sand pails, also chemical extinguishers. Our glue room, dry kilns, shaving vault and boiler room are all equipped with steam jets direct from boilers, this being without doubt one of the surest and least destructive methods of checking a fire in a confined area.

Our gasoline is stored underground, whilst all oils are kept in approved metal containers, and every pre-

caution taken to reduce the fire risk to a minimum, but all this, without the intelligent co-operation of the whole staff, will be of little value. Our men are taught that they would suffer loss and inconvenience in like proportion to the firm, if the plant was wiped out by fire, and so we endeavor to spread the responsibility, making each employee bear his share, thereby keeping fire prevention a live question.

Steaming Before and During Kiln-Drying

Why Resort is Made to Steaming—How Casehardening and Other Strains May be Relieved —A Few Don'ts for the Seasoning Process

By W. K. LOUGHBOROUGH

Forest Products Laboratory, Madison, Wisconsin.

When either water or steam at high temperatures comes in contact with wood, the wood substance is made plastic. The softening effect increases as the temperature increases, but the ratio is not known. While it is true that wood is very weak when hot and wet, it is not apparent that this weakening effect exists after the wood becomes dry. The weakening effect exists after the wood becomes dry. The penetration of the moisture from steam is greater at high kiln temperatures and low moisture content of wood than at lower temperatures and higher moisture content, partly because the vapor pressure on the outside of wood is made higher than the vapor pressure inside. This fact necessitates the use of live steam rather than exhaust for this purpose. When free water is present in the centre portion of the stick, the internal vapor pressure is practically the same as that of the outside air during a process of steaming. In this case any portions between the inside and outside which are of low moisture content or below the fibre saturation point are affected by thee ombined high vapor pressure of the inside and outside. The moisture content of this portion is thus increased by the increase in vapor pressure. The softening effect on the fibres in this intermediate zone must depend on the transfusion of the internal moisture inasmuch as it takes a long time for water vapor (not the heat) from the surface to penetrate through wood even though the wood and vapor are hot. For example, it took six days of constant steaming at 165 degrees Fahrenheit and 100 per cent. humidity to raise the moisture content in the centre of 2½-in white ash form 7.4 per cent. to 19.1 per cent. After 36 hours the centre had been raised 2.9 per cent .

Purpose of Steaming and Conditioning Treatment

Steam as understood in the art of kiln drying is space saturated with water vapor at any temperature. Steam is made use of because of the softening effect it has on wood fibres and because it makes it possible to supply the wood with heat without causing evaporation. These two qualities of steam are made use of in kiln drying to prevent and remedy many seasoning defects. It should not be resorted to indiscriminately as a cure of all the ill-effects resulting from seasoning, although through its judicious use many defects of kiln drying may be eliminated. Steaming may in fact cause ill-effects at certain stages in the drying or if improperly conducted. However, its legitimate and wise use is to be recommended.

Steam and conditioning treatments are given lumber for three general purposes: First, to heat the stock through at the beginning of the run; second, to kill mold and some wood destroying fungi; third, to remove stresses.

It is beneficial to steam at the beginning of a kiln run, to heat the stock thoroughly before evaporation from the surface begins. The surface of wood ordinarily dries more rapidly than the interior water can transfuse through the wood, with a resultant danger of surface checking and casehardening. Inasmuch as heat stimulates transfusion, it is desirable to have the centre of the wood hot before any drying takes place. If the cold stock were placed in air at less than saturation the temperature of the centre of the piece would always be less than the dry bulb temperature of the surface until evaporation ceased. As heat is made latent through evaporation, the temperature of the air of the kiln is higher than that in the centre of the wood. It has been indicated in several experiments that the temperature on the inside of a piece of wood comes to balance with the dewpoint of the air surrounding the piece.

Whether initial steaming reduces the subsequent drying time or not is uncertain. In the case of 2-in. oak plank cut from the outside 6 in. of 26 different logs, including four species, the initially steamed stock dried more rapidly than matched plank which were not steamed. The drying rate of heavy stock, 4 x 5½ in., cut from the heart of the same 26 trees, was only slightly accelerated by the initial steaming.

Mold thrives on the surface of wood when it is moist and warm. While not in itself injurious to the wood the presence of mold indicates conditions which are conducive to actual decay. Mold often develops to such an extent as to seriously obstruct circulation of air through the pile. This is such a decided hindrance to successful kiln drying that steps must be taken to prevent growth. Inasmuch as mold will not withstand high temperatures, steam is an excellent means of applying to the surface of the stock a degree of heat which will kill the mold. The saturated air prevents surface drying and thus the injurious effects commonly produced by high temperatures are prevented.

Steam and even hot air somewhat less than saturated may be used to remove the fibre stresses set up during drying. If the surface is in tension it is possible to so swell it by increasing the moisture content that it will be in compression it is possible to soften the outer fibres so that they no longer resist the inner tension, thereby permitting more normal shrinkage.

To Re-establish Transfusion

Steaming is sometimes resorted to to re-establish the capillary flow after the surface has been excessively dried. Periodic steaming thus apparently increases the drying rate, but this may be due more to the fact that after steaming the centre of the material has available

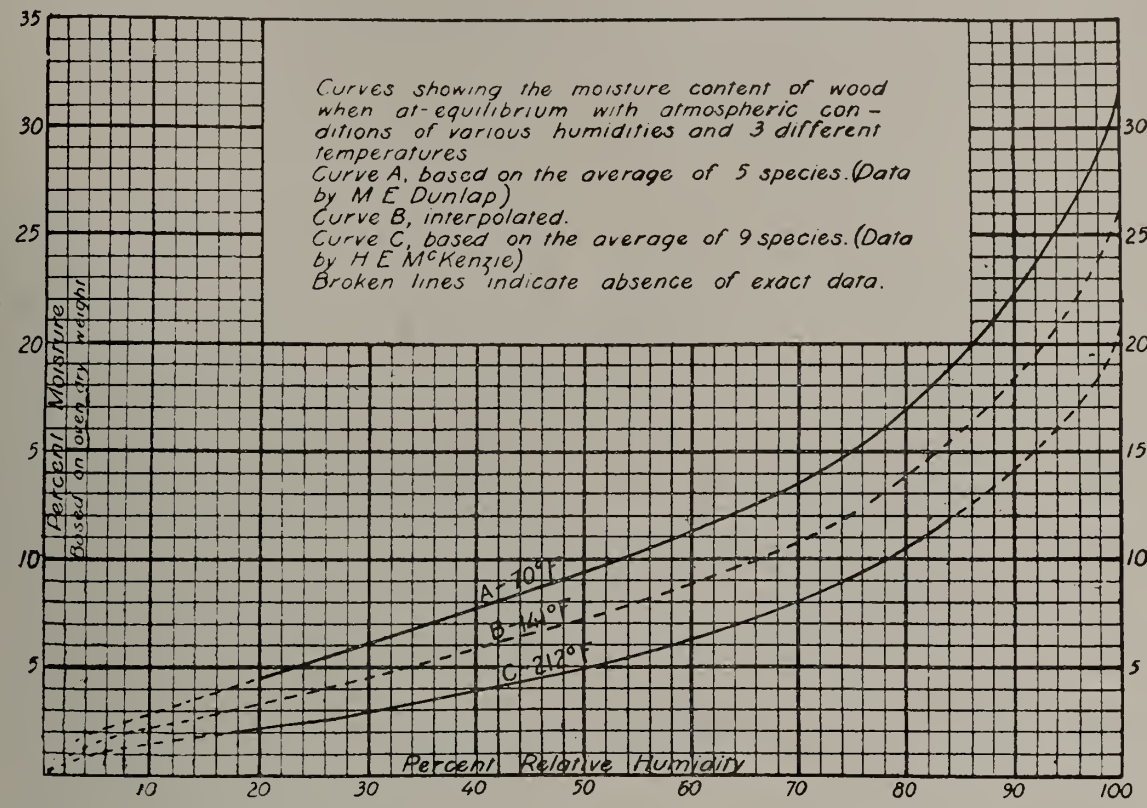


Chart showing moisture content wood will ultimately reach under varying conditions of humidity and temperature.

a large supply of heat which is utilized in vaporizing the internal moisture.

Directions for steaming lumber up to 10/4 in thick, to heat stock through at beginning of run: Green stock should be steamed at 25 degrees Fahrenheit above the initial temperature (100 per cent. humidity) until the stock is heated uniformly throughout, usually requiring about one hour to the inch in thickness. This initial steaming is not detrimental to successful kiln drying of perfectly green stock, providing the cooling is accomplished slowly and in saturated air. In fact, steaming 4x5½-in. green oak for 24 hours at 190 degrees Fahrenheit at the beginning of the run has been accomplished with no visible damage. However, it was cooled to the drying temperature in completely saturated air. This treatment is not recommended because it tends to induce excessive shrinkage, which is troublesome in large material such as bolsters.

Partially air dry stock which is surface checked to any extent should not be over-steamed. The outer fibre should be softened with the minimum amount of swelling inasmuch as if the surface is excessively swelled and put into compression the resultant internal tension will tend to deepen the checks. Inasmuch as heat in this case is the primary softening factor, it is desirable to use high pressure steam so as not to increase the surface moisture materially. Steaming treatment should not be continued after the surface checks close. If lumber of any species is so near dry that its centre contains less than 18 per cent moisture, it should not be steamed at 100 per cent. humidity, but should preferably be conditioned in air at 165 to 180 degrees and whose humidity is less than saturation, 65 to 85 per cent. relative humidity. This conditioning treatment will require from 10 to 30 hours, dedpending on the moisture content of the stock and how badly it is casehardened. When the moisture content is low, and the stresses severe the relative humidity should be 60 to 70 per cent., temperature high and the period long.

To Kill Mold

The most effective manner in which to kill mold in a dry kiln is to steam the stock at approximately 170 degrees or 180 degrees for a period not exceeding an hour. It must be borne in mind that, unless it is desired to relieve stresses also, the interior of the stock should be heated as little as possible. Therefore, the steam supply should be sufficient to reach the desired temperature in 25 or 30 minutes. To accomplish this result, plenty of live steam at a pressure of at least 70 lbs. gauge must be available. The size of supply line and the number and size of perforations that may be required in the steam jet line will vary with local conditions within reason; it is impossible to make them too large or too numerous, as the quicker the steam is supplied the better the effect. Care should be taken to see that the stock cools in nearly saturated air.

Set-casehardening is defined as a condition of stress produced in wood by the difference in the amount of shrinkage produced in two adjacent zones of wood of the same moisture content. The zone which shrinks the least is said to be set in an expanded condition.

Wood becomes soft and plastic when treated in hot, moist air. The degree of plasticity varies almost with the temperature and relative humidity of the air sup-

plied. That is to say, wood becomes more plastic when steamed in saturated steam at high temperatures, 180 to 212 degrees, for example, than when treated in air at 140 degrees Fahrenheit and 70 per cent. relative humidity, or soaked in cold water. In short, it requires the combined effects of heat and moisture to make wood fibres so soft that they can accommodate themselves to the ever-increasing demands to change of shape and of dimension as drying and resultant shrinkage progresses.

The relief of casehardening is a matter which requires both knowledge and experience. No absolute rules can be laid down by which the best results can be obtained under all conditions. The treatment used must be the one which will properly relieve the compression stress wherever it may be. If the moisture distribution test shows that the compression zone is near the surface, i.e., that only a thin shell has tried to shrink, it will not take a long steaming treatment to soften the fibres. If the compression zone as determined from a slotted case-hardening section extends quite a distance into the piece and the moisture content of the zone is low, it is obvious that a short conditioning treatment will not relieve the set because the moisture required to soften the fibres cannot be supplied in a short time, as has been shown previously. When the stock has been heated to the centre, moisture from adjoining cells will diffuse into the cells of lower vapor pressures, but some time will be required before this transfusion can be established.

Duration of Softening Treatment

The duration of the treatment will depend on the depth of the casehardened zone. The temperature should be governed by the degree of softening the fibres require.

Temperatures from 160 to 180 degrees and periods from½ to 3 hours, if steam is used, and from 6 to 30 hours if the air is not saturated.

As already pointed out, the fundamental principle which underlies the problem of relieving stress in wood is that it requires an actual contact between hot vapor and the wood substance which is to be softened. If the vapor is not in the cell when it is heated, it must be supplied by the external vapor or by the vapor of the interior cells, which contain more moisture. It should be borne in mind that saturated water vapor can not give up its heat except by condensation. If heat is being transmitted to lumber largely by saturated water vapor, it is evident that the surface of the lumber will have a larger amount of moisture deposited upon it than if air transmitted most of the heat to the lumber. It must also be borne in mind that the more moisture there is in wood, up to the fibre saturation point, the more plastic the wood becomes when heated to a certain temperature.

These two facts make it clear that it is possible to relieve the "set" in the surface of a board in any humidity above that required to stop evaporation and that the softening effect can be controlled by controlling the amount of moisture in the air which can be picked up by the board.

Things Which Should be Avoided

There is no danger of softening the surface of the board too much as long as there is plenty of moisture in the board itself, which, when heated, will soften the internal wood fibres. In that case the set of the inside and outside are alike relieved and any difference in shrinkage is due to a difference in moisture content only. If, on the other hand, there is not sufficient moisture in the centre to soften the internal fibres while the surface is saturated, the surface set will be relieved while the set in the internal zones still remains. This is called reverse casehardening, and is a very unfortunate condition, because it can never be corrected save by moistening the material clear through and subsequently redrying it carefully.

In general it is safe to steam (100 per cent. relative humidity for from ½ to 3 hours) when the centre of the material does not contain less than 18 per cent. moisture. When the centre is drier than that the humidity should be so regulated that the surface can not become too moist and thereby softened more than the interior. In giving a high humidity treatment when the centre of the stock is from 15 to 18 per cent. the relative humidity should be between 70 and 85 per cent., below 15 per cent. and not less than 7, the relative humidity should be 60 to 70 per cent. The duration of the treatment will range from 10 to 30 hours. See Plate 1 as a guide for proper relative humidities to use in conditioning lumber at any desired temperature. As heat is also a big factor in any conditioning treatment, it is desirable to use a temperature ranging from 160 to 185 degrees, irrespective of species.

It should be borne in mind that steam at low pressures contains less heat per unit of weight than at high pressures. So if it is desired to heat the kiln of lumber to a certain degree with low pressure steam the moisture content of the stock will be increased by a greater amount than if the same rise in temperature is produced by high pressure.

Periodic Steaming Treatment

Steaming periodically once a week even when the stock is above the fibre saturation point is beneficial. These steaming treatments should be at about 20 to 30 degrees higher than the drying schedule and should continue only long enough to heat the stock through at that temperature. If high pressure steam is used the time will vary from one-half an hour to three hours. This method of treating the stock produces the minimum amount of set and tends to decrease the drying time.

When steaming, the air should be saturated while the temperature is being raised and the humidity should remain high while the kiln and charge is being cooled down. It is desirable to build up the temperature as quickly as possible, since a slow heating process means a loss of time and also tends to wet the surface of the stock too much. Vents should not be opened if by so doing the humidity regulation is lost. In a conditioning treatment everything depends on the humidity control, so use heating coils only as means of maintaining humidity desired.

Frequently it is hard to establish circulation after steaming, since the saturated air will remain stagnant unless something is done to break up its state of equilibrium. Any motion of air through this zone will break up the stagnation. Different means of doing this must be worked out for almost every installation of kilns.—Sash-Door-Finish.

Woodworking machines at an exhibition always have a fascination for the average man. The trouble is, that the machine can not show its paces at an exhibition.

Move to Standardize Wooden Boxes

Bureau of Explosives, Under Col. W. B. Dunn, Has Been Asked to Undertake Study of This problem—Outline of Procedure to be Followed.

By Col. W. B. DUNN, Address Before National Association of Box Manufacturers.

You probably know that almost from the beginning of its work some fourteen years ago the Bureau of Explosives has been charged with the duty of specifying shipping containers for explosives and other dangerous articles. The object of the work of the Bureau of Explosives was to secure safe transportation of these dangerous articles and it was appreciated very early in the work that the prime factor in getting that safe transportation was to get efficient, good shipping containers.

It is more true of a dangerous article than any other article, but I think it is true of any article, that if you are going to get safe satisfactory transportation you must avoid leakage. You can't afford to have your article get out of its container, get free and lost in the car or on the freight platform. When an explosive or inflammable liquid gets out you are liable to have an explosion, with fire following it; with ordinary articles you have a loss. In either case you have a loss and loss is what we are trying to curtail.

To Cover All Classes of Freight

It is a fact, I think, that the country generally has appreciated the value of the standardization of these containers for dangerous articles. Probably as a result of that general appreciation, the railroad executives some time ago decided that they wanted the Bureau of Explosives to expand that work and to start, at least, the very important and far-reaching task of standardizing shipping containers for all classes of freight.

It was an exceedingly important and difficult task that was put up to me by that decision. It is true that no one expects a revolution of present practices in any short period of time. The idea of the railroad executives was to start this thing and to let its program depend upon development. My plans, so far as I have perfected them, are as follows:

In a very conservative way I am going to build up a personnel to handle this proposition. During the present year, in fact up to the present time I have picked out four young men, engineers who have the requisite education as a foundation, and I hope the energy necessary to apply that education in the line in which I want them to work. They are being trained at the present time, first in the regular Bureau of Works so as to understand our methods and to be available to do Bureau Work if required.

Will Make Detailed Study

When that training is completed some one industry will be selected and one or more of these men will be assigned to the task of studying and investigating the shipping containers to be used in that industry. They will go back to the manufacturing centers where the product itself is started in largest volume. They will go to the manufacturing centers where the containers are made in largest quantity. They will find out, list and describe in detail all of the different kinds of containers that they find being used in that industry. They will collect from all sources all of the specifications that they find being used in the manufacture of the container, any rules that may be in the railroad tariffs or in the classifications, any specifications that may be used either in a limited way or a general way by the large shippers or by the container manufacturers.

They will study from an engineering standpoint as well as they can the details of design and construction of these various containers that are being used in that industry. As far as the engineer himself is able from his experience, he will point out where improvements can be made without any increase of cost. It is the making of improvements without any increase of cost that we hope to register the greatest amount of progress.

Will Select Best Practice

Now, when he has looked over the field in that way I fancy that he will find that when you classify the containers in actual use in that industry, they may run through more classifications than good, bad or indifferent. There may be a dozen or more classifications, when you run down the grade of efficiency. If we were looking solely to the interests of the railroad, we might possibly tell this engineer to design a package which will surely carry the product through without leakage under any kind of rough handling. It is not my intention to do anything of that kind. My instructions will be to look for the best package that is in general voluntary use as a tentative thing to pick out for a standard.

Where you find such a package in general use, much better than many of the packages in use in the same industry, I think it quite fair to assume that that better package is there because some far-seeing man or group of men, either in the shipping line or the container line, realized that money put into that package was well spent. If we find that that is true, then it is not asking too much of other people to gradually work up to that standard.

When this engineer, after his investigating has presented to me this mass of information in regard to that industry, and has presented to me a tentative set of specifications for the various satisfactory containers that he has found in use in that industry, I want then to have at my elbow in the studying over of this important matter, what you might call a technical jury. I want a body of men to whom I can refer this mass of information, these recommendations of this engineer and ask them to look it all over and from the standpoint of their broad experience, tell me what they think about it.

Each Association to Have Representative

I want that jury composed of the very best men that the associations who are asked to contribute representatives can pick out. There will be at least one representative, according to my present plan, from each association of men who are engaged in the manufacture of shipping containers. For example, the association here to-day, interested primarily in the manufacture of wooden boxes, should in my opinion pick out the best engineer that they have, the

man of broad technical engineering experience, because only engineering questions are coming before this jury. There are lots of other questions that come up but they must come later. The first step is the engineering study of the question.

In the same way that the box manufacturers association, the wooden box is represented, all other associations of men who make any other kind of container, any other kind of a box, fiber box, wirebound and the barrels, as we come to them later on, wood, metal if there were in use any metal boxes we'd get the metal box men.

After we get this committee organized and we get the data as I have described up to it, I really believe that we can get from your committee and from my report which will be based upon your help and recommendations, something that can go to the railroads and the shipping interests of the country as a real, practical, efficient standard for the particular kind of a shipping container that is being considered at that time.

All Interested To Co-operate

If we take, for example, the boot and shoe industry, just an example of hundreds of other industries that must be taken up before this board, if I assign a man, as I have already assigned a man to that particular study, when he gets his report on the containers for boots and shoes and the thing is ready to go before this jury of experts from the shipping container organizations, I of course will ask the boot and shoe industry to appoint a technical man and the best man they can find, to become a member of that committee while the boot and shoe question is under consideration. Possibly other than technical men from the boot and shoe industry might be useful at the time that that report is under consideration.

A man who doesn't know all about the design and manufacture of boxes but does know the trade end of the situation and the requirements that these packages must meet to be successful in the trade, what he says would be of use in considering this particular question, but these representatives of the boot and shoe industry would be members of this jury only while that boot and shoe proposition was up. When some other question, dry goods for example, was up before the jury, why there'd be some man from the dry goods industry that would be a temporary member of this committee I am trying to organize while your representative would be a permanent member.

Peculiar Situation Exists

This suggestion to you to standardize wooden boxes is not, fortunately for the Bureau of Explosives and the railroads and everybody interested in the subject, a new thing. You have already appreciated the importance of that. You have already taken the pioneer action necessary to develop information on it, so we are simply asking you to do something that you have already decided to do. I know that and os I feel that my request to you to appoint a member on this committee will be a welcome one.

It is astonishing to me that all shipping containers for years in this country have been made apparently without anything more than a desire to meet local conditions and local problems. It is almost to my mind the same as if our engineers throughout the country had built bridges without having any real design for bridges and without any method of computing stresses and strains and without any mathematical knowledge beforehand that the bridge was going to be satisfactory. If that had been our plan, you see what kind of bridges we'd have all over the country.

This is an engineering age. Anything that is mechanical in design or construction must pass through the engineer's hands before it gets anywhere else, and you in the country at large, it seems to me, have been negligent in not developing your engineers and putting them on the job before you settled down to say what you were going to do. I think in a general way that explains just what I have in view in the organization of this committee.

Box Men in Convention

The convention of the National Association of Box Manufacturers, staged at Atlantic City October 5th, 6th and 7th, was one of the most enthusiastic and best-attended gatherings of this kind ever held by the box men. More matters of importance to the industry were handled at this gathering than at any preceding meeting, and the future work of the association as outlined is such that when carried to a successful conclusion it will reflect directly to the industry and will put it on a higher basis than it has ever been before.

One of the most important matters handled had to do with the appointment of a representative to work with the Bureau of Explosives of New York City on specification work. The Bureau of Explosives, which represents Canada as well as the United States, have determined to make a study of box specifications with the idea of curtailing as far as possible loss and damage claims.

In the past there has been a feeling that the scientific information gathered from box tests by the Forest Products Laboratory was merely interesting and was more of an academic nature than practical in its application, and further that the information would not be used in an endeavor to compel manufacturers to produce a better container. This new move on the part of the Bureau of Explosives, which is being undertaken in conjunction with the various railroad systems, means that the information gathered by the Forest Products Laboratory will be used by this Bureau as a basis on which to build specifications.

Thus it is likely that it will be necessary for the box industry to study their product, especially in view of the information brought out by the scientific tests carried on by the laboratory, and make what changes in their line are required to meet practical manufacturing conditions.

Nailing Suggestions

"Use only cement coated box nails.

"Drive nails flush. Do not over-drive.

"Start one inch from edge, space nails holding to end grain about one and one-half inches apart.

"Space nails holding to side grain not over two inches apart.

"Use 6 penny cemented box nails for framing and top and bottom.

"Tops and bottoms should be side nailed.

"Use 4 penny cement coated box nails for side nailing.

"Five nails in side nailing edges increases strength of case 50 per cent. over same case nailed with four nails.

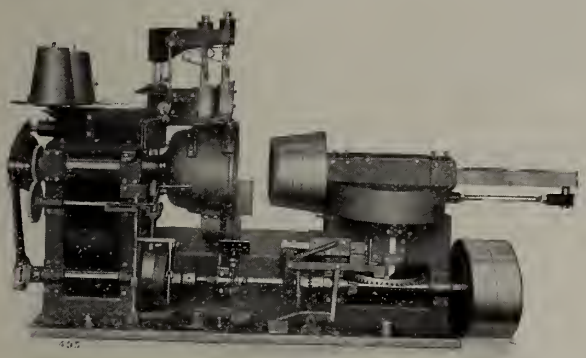
"Side nailing should be done at cannery."

Safety first means always put the belt on the loose pulley before you leave the machine.

Machinery & Equipment

Bushel Basket Machine

A machine for making bushel baskets, known as the "Merit Bushel Basket Machine", is shown in the accompanying illustration. This is manufactured by the Merritt Engineering & Sales Co., Lockport, N. Y. The making of bushel baskets is a production job, and to be able to compete successfully, one must be able to turn them out rapidly and at a very low fixed

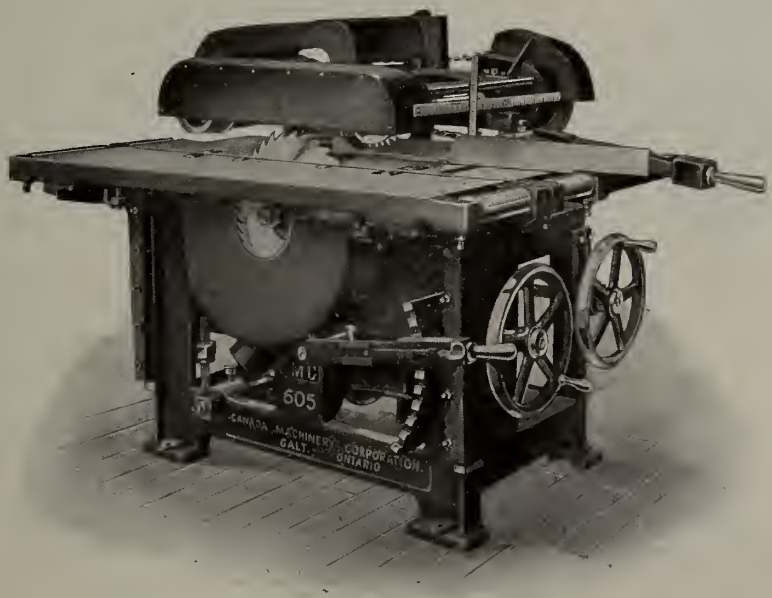


The "Merit" bushel basket machine

cost. This machine requires but one operator. Two inside hoops, previously formed, are slipped into place on the male form. The two outside bands are entered in the guides in front of the stapling device. The braid is placed in a vertical position between the two forms, its lower edge resting upon the adjustable centering device. When one lever is pressed, the male form moves forward, forcing the braid into the hollow form, making the basket, and when the second lever is pressed, the two forms with basket between them, begin to revolve, and at the same time the staples are formed and driven. When the last staple is driven, the movement stops. The revolution of the forms and stapling maximum can be stopped instantly at any part of its way round. A machine of this type is capable of producing 175 dozen baskets in a ten-hour day when operated by one man.

New Self-feed Saw

A number of new saws are being placed on the market by the Canada Machinery Corporation of Galt, Ont. One of these machines was described in the October "Canadian Woodworker." A second, the No. 605, is illustrated and described herewith. In telling us about this saw, the makers say that after thirty years' experience in the building of self-feed rip saws, they deemed it advisable to include their new improved patented features in a saw of this type. Many parts of the older types have been eliminated, the result being a simple machine of improved design which is capable of producing a very satisfactory grade of work. In this new saw, the table is made in two parts. The inside edges of these two sections are fitted with wooden strips. The outer part of the table may be opened to give ready access to the saw and also to permit use of gang saws or dado heads. The saw arbor is of large diameter and is supported in three long rigid bearings. A specially designed self-oiling end thrust has been provided for taking up end-play. The collars, which grasp the saw, are of large diameter, holding the saw stiff and firm. The feed

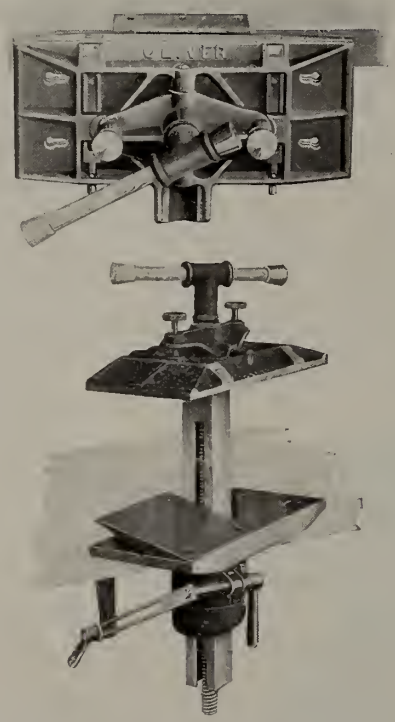


Self-feed rip saw recently placed on market by Canada Machinery Corporation, Limited, Galt, Ont.

is variable from 1 to 225 feet a minute, and is under the instant control of the operator. The feed-roll yokes are of an entirely new system. Both the infeed and outfeed yokes have the pressure applied for feeding purposes directly in line with the cut. The feed rolls in rising to the work, lift in a vertical line the driving shaft or roll, remaining parallel to the table. This assures a straight line feed. Two index scales are attached, one showing the width at which the fence is set, and the other the thickness for which the machine is set to cut. The feed rolls are subject to adjustment and may be set for either short or long stock, as desired. Large hand wheels are provided for adjusting the feed rolls, also for raising and lowering the table. Short idle rolls are fitted in the bed to facilitate the movement of stock across the table.

Efficient Type of Vise

A vise known as the "No. 1 Universal Pattern Makers' and Woodworkers' Vise" has been put on the market recently by the Oliver Machinery Co., Grand Rapids, Mich. This is a new product and embodies several new features. As the name "Universal", implies, it can be used for holding stock of various shapes



Two views of Oliver Universal Vise

and can be tilted to practically any position. The jaws are 7¼ inches wide by 18 inches long and will open to 16 inches. The screw is made of steel 1⅛ inches in diameter and having buttress thread. The clamp lever, shown with two thumb screws, is used to set the jaws to hold wedge-shaped work. It will be noticed that it is equipped with a number of dogs which make it very handy for cabinet-making and pattern work, where many pieces of irregular shape are handled in the course of a day. By turning the vise upside down, two jaws for holding metal pieces are brought into play. This is a very handy feature. Another feature which might be mentioned is the tilting jaw attachment. This is shown in one of the accompanying illustrations. Taking it all round, it is difficult to conceive of a piece of wood of such irregular shape that it cannot be held in some manner by a vise of this type.

South African Market for Wood Products

The report of W. J. Egan, Canadian Trade Commissioner to South Africa, covering the imports of wood and wood products into the Union for 1920, states that Canadian manufacturers handling these lines have in the past merely touched the South African market, the bulk of the trade going to Scandinavian and American houses.

Of the 2,175,000 cubic feet of flooring and ceiling imported last year, Sweden supplies 1,750,000 cubic feet; Norway, 252,000 cubic feet; Finland, 120,000 cubic feet, andd Canada, 22,000 cubic feet. In dressed woods and matched flooring Canada heads the list of shippers, with 58,000 cubic feet, while U. S. manufacturers come next with 54,000 cubic feet. Plywood to the value of $139,000 was imported during 1920, and of this Canadian produeers supplied only a few dollars' worth. The same holds true of windows and doors, the bulk of the business going to Swedish and American houses. The imports of wood handles totalled $285,000, of which Canadian manufacturers supplied $21,000.

This market offers a good opportunity for box manufacturers. The value of the shooks imported during the past year was $1,001,675. As with the other lines, Sweden secured the bulk of this business. Mr. Egan states that if Canadian box manufacturers were organized along the lines of the Baltic exporting firms, there is no reason why Canada should not secure a greater share of the box and shook trade. In the standard orange box alone, it is confidently asserted that the annual requirements will not be less than a million boxes, and, in addition, there are many other standard containers used in the country, which means a demand for many additional hundreds of thousands of boxes.

The freight rates are one of the crucial factors in this trade. No matter how up-to-date the Canadian plants may be and regardless of how plentiful a supply of raw material they may have, unless the ocean freight rates are lowered so as to compete with the Baltic rates, the Canadian manufacturer canont secure and hold this market.

It is advisable to have several traps in the floor connected to the dust-removing system. All that is needed, then, to have a clean mill is the inclination and a broom and a boy to use it.

The woodworker with a drying plant is independent of the weather. He can dry his timber so that it is easy to work, and safe, after it is manufactured.

Theer are a good many devices for setting circular saws, but to get exact and clean sawing a gauge and saw set should be used.

It is advisable not to over-drive nails in a box. Nails which are over-driven crush the fibres of the wood from 1/16 in. to ⅛ in. deep, thus lessening the hold of the nail.

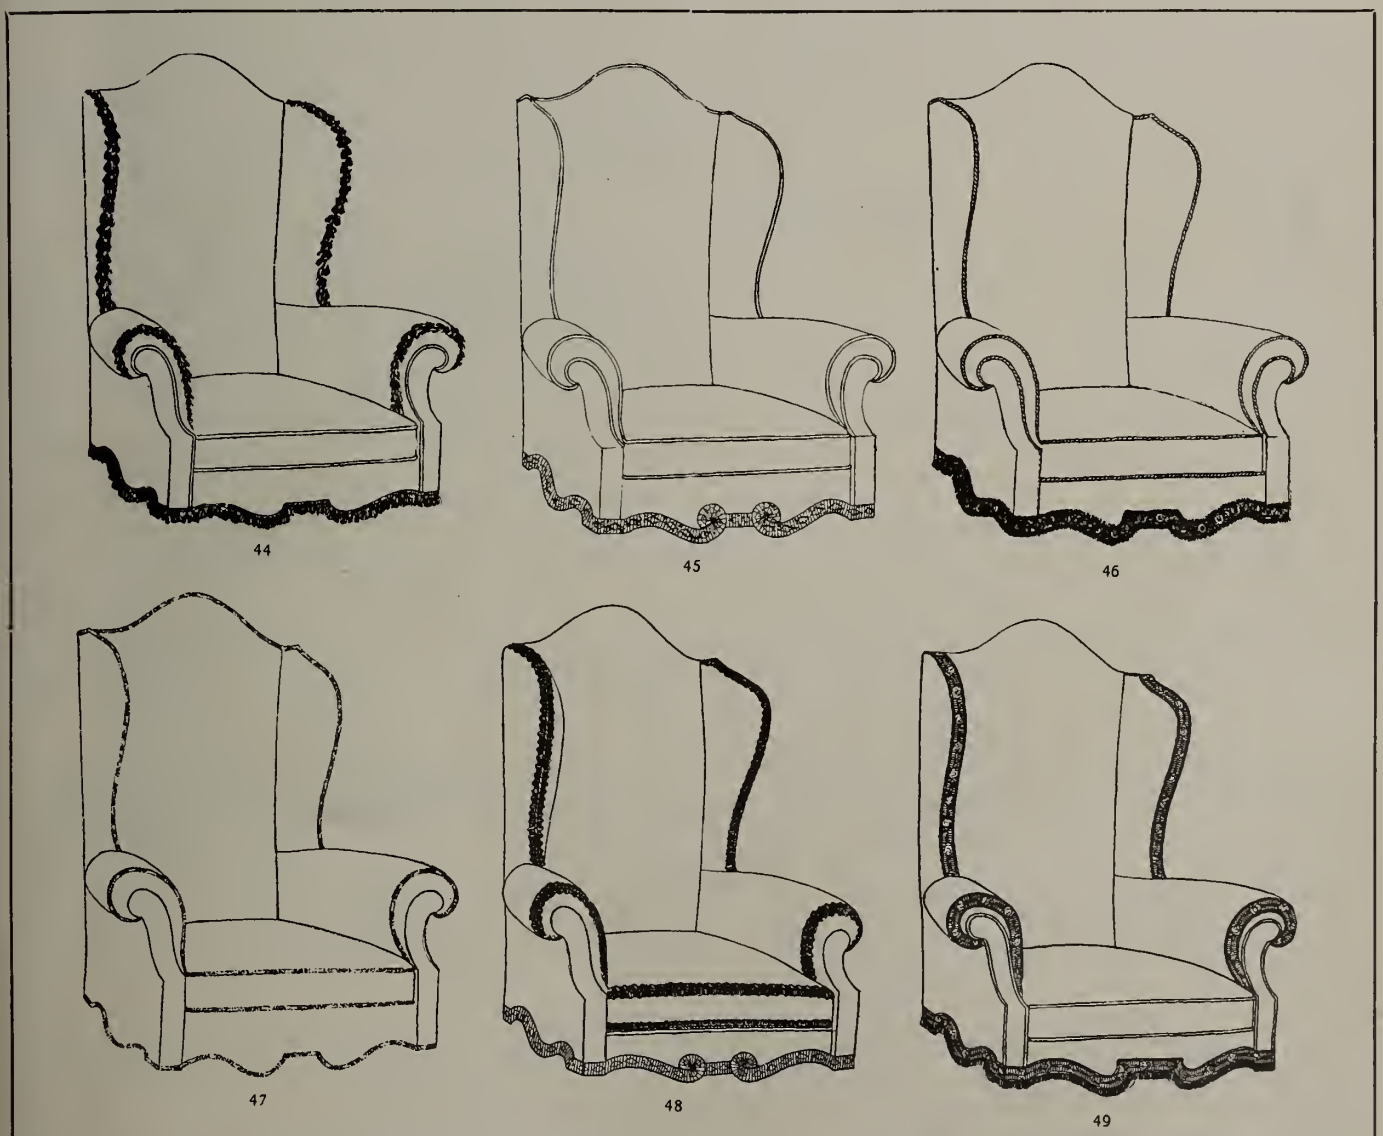
Upholstering and Trimming

Modern Upholstering

Various Ways of Trimming Chair—How Welts Are Made—Employing Glue to Attach Trimmings.

There are various ways of trimming the chair illustrated in Fig. 41, and in some cases the character of the intended trimming not only determines the final appearance of the chair, but has much to do in indicating the preliminary upholstering. This occurs particularly with regard to the finish of the edges. If the wings and back are finished to a knife edge and intended to be trimmed with a stubby fringe, as indicated in Fig. 44, the knife-edged upholstering must be determined upon before the chair is started. In like manner, if the chair is to be finished with double welts, like Fig. 45, the edges and nosings, which form the foundation of the upholstering, must be kept square at the top of the back and on the edges of the wings to create a proper foundation for the welting.

Fig. 46 shows a cording treatment where a separate silk cord replaces the welt. Fig. 47 shows a moss edge as another variation in the trimming. Fig. 48 shows the same chair treated with a wide galloon on the outlines of the chair, while a double French gimp, with a cord center, is used on the cushion. Fig. 49 illustrates a fancy band trimming in combination with a cut fringe.



How Attractive Effects May be Secured by Varying the Trimming.

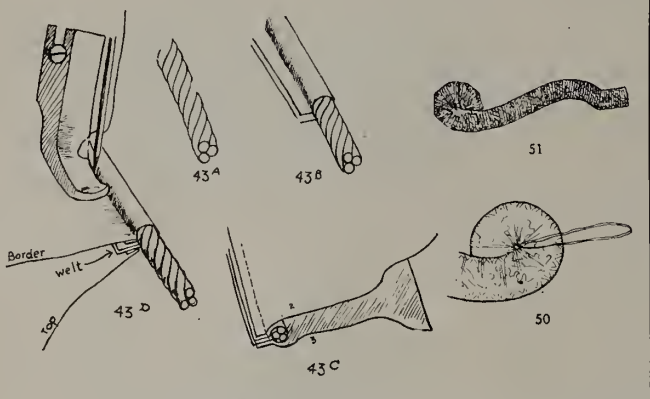
Carvings Should not be Concealed

Loop edge fringes and tassel fringes on the base of a chair such as this are objectionable if they conceal the carving of the upper leg. A stubby fringe, meaning by this term a fringe, the tassels of which literally stick out straight from the heading, may be used with good effect, particularly if it is attached a little above the bottom edge of the frame, so that the carving of the woodwork is not hidden.

Where the welts are made of the goods, it is possible to sew the welt into the covering of the cushion at the same time the cushion is made, thereby saving time and material. The welt is formed by a soft cord, similar to Fig. 43a. A strip of covering, long enough to reach the distance around the cushion and wide enough to cover the welt, is cut like Fig. 43b, and the border of the cushion, the top of the cushion and the covered welt are sewn together by a single stitch from the wrong side, as in Fig. 43c. The cushion cover is then turned right side out, and with a sewing machine, equipped with a special welting foot, a second stitch is run around the cushion just inside of the welt in the manner in Fig. 43d.

Contrast in Colors Attractive

A variation in welting is sometimes created by making the welt of a contrasting plain color; This



Showing How Welts Are Made

method, however, is not recommended because in unskilful hands, it is apt to produce a garish effect. We mention the custom, however, to have our description complete.

In the better shops, where a double French gimp is used as a trimming for the cushion, as indicated in Fig. 48, it is a practice to welt the edges of the covering in the manner we have here described in connection with Fig. 45. The double French gimp has a cord which creates an edge, and the welt is used to make the cord of the gimp fill out instead of sinking into the cushion.

In using a flat galloon, as in Fig. 48, whether it is as wide as indicated in Fig. 49, which covers the face of the wings, or is merely a one-inch galloon as is indicated on the base of the chair in Fig.48, the character, of the appearance will be very largely determined by the way in which the galloon is put on. Neatness is a prime requisite and an important element of neatness consists in the way the pleats are formed in the method of attaching the galloon to the chair.

Must Maintain Lines of Chair

The point we are endeavoring to emphasize is best we show a section of the base of this chair with a one-inch tinsel galloon tacked into position, the fullness of the curves being disposed of by pleating. As an alternative, Fig. 50 shows a combination of glueing and sewing. The lower edge of the galloon is glued all along the base of the chair, being held with tacks until the glue hardens. This method leaves the upper edge of the galloon unattached. In all galloons there are fairly stout warp threads which form the selvage. With a pin, it is possible to draw two or three of these warp threads through the edge of the selvage and utilize them as a shirring string to dispose of the fullness in the manner indicated in Fig. 50. This not only disposes of the fullness equally, but it also creates smooth curves which are finally sewn to the covering with a small circular needle and thread, which matches the covering, thus creating the appearance shown in Fig. 45.

Glue is employed frequently for attaching the trimming to the hard base of the chair, but on the edges of the arms, the wings and the back, it is always better to sew the trimming in position, whether it consists of fringe, cord, moss gimp or welted paneling, and it is a practice in good shops, wherever there is a flat trimming of any kind, to have the same pinned into position complete before sewing, as only in this way is it possible to maintain a uniform appearance between the right and left sides of the chair.

Cording, such as is shown in Fig. 46, is usually sewn on free hand, but care should be taken to chalk the line of sewing so that an accurate and symmetrical outline will be presented in the finished article.

Increasing Supply of Upholsterers

The National Association of Upholstered Manufacturers recently held their semi-annual convention at West Baden, Ind. A number of interesting and pertinent topics were discussed. One question of great importance, which came up for discussion, had to do with the training of apprentices. It was proposed that the members of the Association inaugurate a system whereby they undertake to train one apprentice for each journeyman upholsterer in their plants. Another proposal was that the executive secretary use every effort in his power to influence the members to make their prices accord with their costs, leaving a reasonable profit, rather than to follow the market in a purely competitive way regardless of cost. Both these subjects are of vital interest to all furniture manufacturers and should receive their thoughtful consideration.

Practical Carpentry and Practical Joinery

Two practical well-illustrated volumes on "Modern Carpentry" and "Modern Joinery," have been received recently from the publishers, Messrs. B. T. Batsford, Limited, 94 High Holborn, London, England. The author, Mr. George Ellis, is a well-known craftsman of long and varied experience who has a number of volumes to his credit.

"Modern Practical Carpentry" is a large volume containing 500 pages with about 1100 illustrations and deals in detail with the methods of constructing and erecting roofs, floors, partitions, scaffolding, shoring, gantries, centering, stands and stages, coffer-dams, foundations, bridges, gates, tunnels, half-timber house and other structural details. It also contains new and simple methods for finding the bevels in roofs, setting out domes, steeples, etc., an account of fail-

ures in construction and a chapter on the uses of the steel square. The illustrations, many of which are single and double-page plates, show in detail the various phases of the subjects treated.

"Modern Practical Joinery" is a larger book containing about 600 pages, together with 1400 illustrations. It deals with the finer phases of construction work both by hand and by machine. Some of the subjects covered are drawing instruments and their use, tools, appliances and apparatus, joints and fasteners, machine shop practice, uses of steel square, house joinery, bank, office, church, museum, domestic and job fixtures and fittings, showcases, airtight cases, splayed and shaped work, new materials and methods, stair buiding, doors and panelling, windows, fittings and finishes, compound curve and shape work and miscellaneous fittings and fitments. A chapter on "Foremen's Work" deals with the reading of plans, the meaning of terms, setting out rods, methods of setting out curves, uses of templets and other subjects of vital interest to foremen.

These volumes are not elementary and were not prepared for beginners or apprentices but were written by a practical man for the use of cabinet-makers, carpenters, contractors, architects and woodworkers.

Acquiring Specialized Knowledge

The difference between the man who succeeds and the man who nearly succeeds or fails is largely a matter of attention to detail. Attention to the little thing and the habit of being critical and even hypercritical in work done spells the difference between success and failure in the majority of cases.

There are men who move along in a groove or rut, who do things in the manner that they were taught, perhaps a generation ago, who dismiss all thoughts of work from their mind when the whistle blows and sometimes a half hour or so before the whistle blows. If their work gets past the inspector without any kicks they are satisfied. Such men are oftentimes the gamblers and critics who cannot see why their pay is not increased with their length of service. They understand their craft but superficially. Let an occasion come up when just a little more technical skill than a rush 'em through job requires and they are colloquially speaking "up against it."

The furniture business to-day calls for technical knowledge—more of it every day. The man who designs must know something more than merely to sketch a chair leg, or to make a scroll, or handle a simple blue print. He should have the history of design at his finger ends, so to speak, and to be able to know Renaissance from Chippendale, or Queen Anne from Louis XV. He ought to know something—a great deal—about color schemes and architecture and the niceties of interior decoration. In the future he must know these things. He also must be a construction engineer.

The finisher who does not know the chemical action of the pigments he uses and how they will act under certain circumstances, who goes on the guess work principle is going to be a heavy liability to his firm some day. It is the same in almost any branch of the furniture industry. The composition of glues, the quality of woods, the nature of fabrics, the handling of leather all call for technical knowledge. And there are a score of sources available for the man who really wants to know how. Then why not learn?

The long winter evenings are again with us. Suppose you read only two or three books this winter, each one telling you something about your line of work. Cabinetmaking, Designing, Upholstering, Finishing, Woodcarving. Get a book and read it through not only once, but twice or three times. Make up a list of questions yourself from the reading matter and then ask yourself these questions and see how much you remember of what you have read. Don't think that you are doing this for your employer; you are doing it for yourself. You need this knowledge, besides all that you can acquire from actually doing the work. Start this week and see how much you can absorb by spring. Some day, maybe soon, you'll find it mighty handy knowledge.

One manufacturer in Memphis, in commenting on the present situation, says that it has been apparent for some time that any decided revival of buying would accentuate the absence of normal production of southern hardwoods, and it is equally apparent from the anxiety that buyers are displaying that they are afraid there is going to be an extreme shortage of supplies before production can get under way. There has been some increase in production stimulated by the greater strength and activity of the market, but it will take a long time for the output to be brought back to anything like average for this time of the year. This is the season during which a supply of logs for next year's cut is gathered, and, while weather conditions in the lumbering areas have been almost idle during the past month, judging from reports received very little has been accomplished from the viewpoint of trees felled.

Development of Hardwood Finishes

As Finishes are Cheapened through wide Application to Low Priced Products New Finishes Must be Worked out for the More Exclusive Lines

by A. A. K.

The old method of filling woods consisted in applying coat after coat of varnish and rubbing each coat, as it dried, into the wood until there was secured a hard, solid surface. Some other writer says that the old-time finisher scraped down each coat, "until, after a long space of time, the surface was level." That probably was so, but we did it by means of a soft-wood, chisel-shaped paddle, pushing the nearly-dry varnish into the open pores of the wood, and when they were filled it only remained to apply the necessary number of coats of varnish, flowing and finishing to finish the job.

This same writer, whose name I do not have, tells us that the very ancient wood-finishers did not undertake to treat hard, open-pore woods, as we do, but confined themselves to the soft, close-grained goods. At least this was true in a great many instances. And even at that they did much finishing with paint and varnish. We know that many of the pieces made by Sheraton had painted panels, beautiful medallions with Greek subjects. And also, while at this point, let us note that at about the time that the more open-grained woods began to be used, the furniture, which up until then consisted of thin, spindling designs, began to be made heavier and more massive in general design.

Continual Change in Finishes

Wood-finishing has gone through, and continues to go through, a period of evolution. New finishes arise and decay, to be superseded by improvements, and if not always by that, then surely by changes, in the process of evolution. Mission at first related to a design, then it became the name of a finish, as well as a design or style. This style of finish has had great influence in determining shades of finish in all directions of furniture and architectural work. It has proved one of the most popular finishes ever offered to the public. Will it ever become obsolete? Undoubtedly, and be replaced by another candidate for popular approval.

I wish it were possible to write a connected historical sketch on the art of wood-finishing. It would be interesting to know who originated wood-finishing as we know it. That date cannot be very remote. We know that for some centuries wax finishing was in vogue, but as far as the filling and staining of wood is concerned, we do not seem able to find any reliable data.

I have read that a resident of Mayence, Germany, was one of the earliest to devise processes for the staining of wood and that he confined himself almost entirely to alcohol stains because at that time to stain a piece of wood required a week or more, also that the water stains opened the pores of the wood so much that it was almost impossible to properly finish it. For this reason he confined his staining entirely to alcohol stains, nor had he the facilities for staining that we now enjoy. To illustrate this fact we may mention that in order to get a bright yellow stain he had to apply a solution of chloride, after which the stain itself was placed in an air-tight room where it was subjected to the fumes of sulphite of hydrogen. In another case where a certain shade of stain was desired, he was obliged to boil the wood an entire day in one bath and another day in a different bath before the process was complete. If only he had known about the strong acids that we use to-day, just think how it would have helped him.

Advent of Wood Dyes

But I believe that the wood dyes were known about this time, though no great progress was made until the development of the coal-tar dyes. Since their advent wood-staining has become a most important part of the wood-finishing trade. Then along about 1890 oak came into favorable notice in competition with walnut and mahogany, and in time even excelled these woods in the popular regard. At first it was simply plain oak, filled and finished natural, and before long the sixteenth century finish came into fashion, and plain oak became dark-colored. This style did not last very long, and it was replaced by the antique finish, the filler being colored.

A few years later golden oak came into vogue. White oak, obtained mainly from Indiana and Ohio, was used in the production of the so-called golden oak finish. Golden oak, with its beautiful golden flakes, produced by quarter-sawing, must be given the palm for being the most attractive wood finish ever designed, yet as I write this golden oak and its rare flakes and markings is no longer admired; people become tired of the most beautiful human creations in art after a time.

Now we come to weathered oak, a finish designed to simulate the effect of weather and time on the untreated wood. Thus we get the rare soft grays, greens and browns, attractive and universally popular. Such finish could only be done with water stains, and the process involved much time and labor to effect a good piece of work.

Used on Cheap Lines

Hence it came that the manufacturer of less costly furniture was obliged to find a cheaper mode of finishing. When the weathered finish was used only on the best furniture of the mission style all went well, but when, as afterwards transpired, this finish, the weatherd-oak mission, was applied to all sorts and conditions of goods, the buyers of high-class furniture demanded a more exclusive finish, and it was found in mission finish. Now, the early English finish shows a solid effect, the pores being filled, while the surface is left smooth and level. This showed up the

natural beauties of the oak, the fine high lights, as seen in golden oak finish, though very much less conspicuous.

Following the old English finish, and for the same cause as placed the weathered finish somewhat in the background, came the fumed oak effect. Not by any means has old English oak finish been discarded, for it still has many admirers. But more people will admire the fumed oak than the old English. It is one of the most popular of all finishes. But the cabinet and furniture trade were not long in discovering that it was rather difficult to get a good fumed effect. It was obtained by exposing the wood to the fumes of liquid ammonia, after which the wood was coated with shellac, which in turn was rubbed to a dull finish. Some pieces received the fumes all right, but it was found that there was frequently a lack of uniformity, the result of which was that the finish was abandoned to a great extent for some time. But, as it is well known, fumed oak finish did not die, and is still a favorite; finishers sought a better method of fuming the oak, and, of course, found it. Now it is possible to get a very fair degree of uniformity on oak of various kinds.

Great advances have been made in recent years in the art of staining and finishing woods. Silver gray used to be effected by boiling the veneers in a solution of iron sulphite. That has been discarded, and we can get the same effect with an acid stain and brush. While this finish is usually given to maple exclusively, a different handling of it makes it effective on certain other woods.

Origin of Terms or Names

The question no doubt has often been asked, whence the names of the various stains used in wood-finishing? It is generally understood that such names as old oak, old English, etc., originated with the appearance of that wood as seen in the old English cathedrals or castles, etc. What with the finger of time and the deposition of soot and dirt, the old, unfinished oak took on a certain dark appearance that people of our time regard with much favor, and sought to copy that appearance on modern furniture and building construction. But there is another source of supply for the well-known stain names, such as Flemish, Baronial, Sheraton, Chippendale, and so on. These names all indicate a style or design, not a finish, but at the same time convey to the mind certain color effects that go with those designs.

A word concerning mahogany finishing. Water or acid stains have long been very satisfactory, and on all woods; but the drawback with them is the raising of the grain, and this is especially bad in the case of mahogany. An oil stain will not answer the purpose, for it is more of a paint than a stain---very serviceable on exterior work, but not satisfactory on inside staining. Here the soluble-in-oil coal-tar stains come in. With these one may make every imaginable color, and by blending, still more colors. They are made to match the water stains, or acid stains, from which however, they differ in not having the mordant qualities of the acid. They are therefore more transparent and brilliant."—"Veneers" Indianapolis.

If trees were grown square, while they would be more convenient for sawing, they would be less for moving from place to place.

Preventing Troubles of Winter Weather

Winter brings the problem of keeping the finishing room at an even temperature and the importance of so doing has often been brought home to many factories by trouble and loss.

The storage room in which the finished furniture is put must also be kept at an even temperature. If the temperature falls much below normal in the storage room, pieces on which polishing varnish has been applied may crack or check.

If it is at all possible every part of the finishing room and the storage room should be kept at the same temperature. This means that the piece to be finished, the stain, shellac, filler and varnish, the finishing and storage rooms, should all be maintained at a temperature of about 65 degrees. The closer this average is maintained, the less chance there is for trouble to develope. If this even temperature is maintained, there will be no temptation to open the windows to "cool off," if the rooms should become too warm. We are all familiar with the effect of a damp draft of cold air from an open window blowing across any piece in the process of finishing.

If a varnish which has been chilled by being kept in a cold room is applied to the work, cloudy effects are almost sure to result. The cold congeals the oil of the varnish, and makes it very difficult to spread and "lay off." Specks will also be seen on the varnished surface, and sometimes are ascribed to dirt. These specks, however, are a direct result of the chilling and consequent congealing of the oil.

The remedy for these troubles is apparent at once. The varnish must be warmed before use, and this is best accomplished by placing the can in a basin of hot water, or near the steam pipes. Do not place the varnish near any kind of a flame, as the fumes are inflammable, and a blaze is apt to result.

Oil stains, which exposed to cold, will freeze, and the color will be precipitated. This makes them useless until they are warmed in the manner just described, and the precipitate color material thoroughly redissolved. Sometimes cheap creosote oils are employed as a base for oil stains. If such a stain is chilled, a precipitate will be found. This is known as "napthalene," a coal tar product. In other words, it is simply "moth balls" in another form. The finisher should at once discontinue the use of such a stain, as reliable results cannot be obtained, and the presence of the napthalene lowers the solvent powers of the oil.

Great care must be used in warming or heating every single material in the finishing room and competent men must be assigned to the work. Explosions in a finishing room can be prevented by care.

Quality in Finishing Material Demanded

Strength, brilliancy, depth and coloring power are qualities which are being demanded in wood dyes with an ever-increasing insistence. The more proficient finishers—the live wires—are satisfied with nothing less than the best when it comes to finishing materials. They know that unless the dyes and other material used, are of a high quality, it is difficult, if not impossible, to produce a satisfactory finish. In these days of high cost it behooves every buyer to secure maximum value, which is not so much a matter of low price as of high quality.

GETTING THE MOST FROM THE SPRAYER

Keeping the spraying machines clean not only gives best results, but also saves power and materials. The exhaust fan must be given particular care. If the exhaust fan is not kept clean it will soon wear out the motors and will eat up power.

Varnish can be removed from fans by immersing them in cans containing a good paint remover. All of the parts should be cleaned at least once a week.

The following preparation will serve well to clean the fans and parts: Four ounces of melted wax in one gallon of alcohol. It is well to keep the spray gun or spray head in a can of this solution when not in use. The hose can also be cleaned with this solution, but must not be allowed to remain in it for more than ten minutes.

When the machine is to be used for shellac, the platform should be cleaned thoroughly, as it should be kept all the time. In some finishing rooms, waste is prevented by placing a large frame covered with cotton at the back of the hood. This will catch a lot of the material which can be recut with alcohol and used again.

Varnish can be removed in a similar manner. Strips of tin can be placed at the side of the platform to catch the surplus varnish. To remove the varnish which adheres to the strips they can be placed in a small tank of benzoin which will soften the varnish and make it easily removable. The same can be done with enamels, using benzol to soften the accumulated material on the tin strips.

The staining table is sometimes constructed so that all waste stain is kept on the platform or is stored in a trough around the sides.

Where Blame Belongs

The finishing room should never be called upon to cover the mistakes of others. The pieces which come to the finishing room should be ready for the finishers in such form that they can do good work upon them. Many a trouble in the finishing room would never happen if the goods brought there had been worked right.

The foreman of the finishing room ought to be a first class "kicker" about the shape in which pieces are brought to his department.

Every foreman knows that it is impossible to do the right kind of work on a surface that is poorly sanded or to get uniform results on surfaces which have not been cleaned in the right manner.

Sometimes the stock of sandpaper with which a sanding has been begun runs out and a different grade is used in that emergency. There is bound to be a difference which will make trouble for the finishing room and chances are that the finishing room will get the blame and the finishing room foreman pass on that blame to his men and the finishes they use. As a matter of fact the fault lies with workmen who have not done a good job before the pieces have reached the finishing room.

If one has never heretofore given this matter thought, and has imagined that the only difference between a well-sanded and a poorly-sanded surface is in the smoothness and can be corrected in the finishing, he would do well to take a board, and after marking it off into sections, sand each section with a different grade of paper. Then take it to the finisher and have him stain and varnish it, or finish it up in the usual way.

It is a comparatively easy matter to make a nice, clean finish on a surface properly prepared, but an impossibility on a surface poorly sanded. The coarse paper leaves scratches with rough and ragged edges, which turn dark from the stain giving the surface a murky appearance. Sanding with fine paper removes these rough and ragged edges, as well as the scratches themselves, if they are not too deep.

"Pitting" or "Pin-holing"

Experts generally agree that "pinholing" or "pitting" cannot be charged against the varnisher as the foundation of the trouble has been laid before the piece comes to be varnished. A variety of causes are given.

In the first place the filler may be too thin for the wood. Then, the pores may not have been sufficiently filled. In the sandpapering, the dust gets in the pores and it is absolutely necessary to clean them out so that the filler can do its work. The filler must never be too thick as when it is it will not get down into the pores. Care in filling will save many troubles later on.

Sometimes there is too much oil put into the filler which makes the filler stick and will not let it get into the pores.

The chemists at the Jamestown Wood Finishing Company have solved these troubles by exhaustive research and experiment and when Jamestown Fillers are used properly, these troubles can never happen.

Pinholes in mahogany veneer can often be traced to the drum sander. This operation packs the pores full of very fine wood powder which holds the moisture of the stain and when the filler and varnish seals this over a gas is generated which must escape and the resultant ruptions cause pinholes. This can be overcome by brushing the piece thoroughly with a rubbing brush and by allowing the stain at least twelve hours to dry.

Glue does not dry solid but is full of pinholes and when this glue gets in the pores these same pinholes are there. The glue is sometimes drawn up far enough in the pores to prevent the filler from filling them and when the filler is consequently rubbed off, the pinholes remain. Some pinholes are due to the use of poor grades of glue which soften under stains.

Cleaning away all dust, using Jamestown Fillers in the right way, and watching the quality of your glues will obviate much trouble.

Selecting the Best Brush

It is always a good idea to use a brush which suits the work in hand. For applying shellac, a rubber-bound, double chiselled, badger-haired brush is considered to be the best, while for brushing varnish, the material can be spread faster with an oval brush of a suitable size. Some finishers use two brushes when varnishing—an oval brush with which to apply the varnish and a flat one for cleaning it off. For good results, the varnish brush should have fine, pliable bristles.

It would prevent waste of sandpaper if some of the sanding drums closed tighter than they do at the present time.

Nichols Varnish Drying Equipment

A complete unit of fan, motor, heaters, air compressor, with automatic temperature and humidity controls for the correct drying of all coatings on the finest pianos, talking machine cabinets, furniture, automobiles, etc. A new humidifying air washer, which eliminates all dust and dirt, does away with all spray heads and connecting piping.

Will triple the output of your finishing rooms; decrease the congestion in your factory; reduce investment of goods in process and improve working conditions for your employees.

Better finish, scientifically dried from the inside out.

We will analyze conditions in your plant and submit a proposition covering an equipment suitable for your requirements, whether it be for automobiles, talking machines, pianos, furniture or railroad cars.

We have exclusive authority to issue license to use the Grosvenor Process Patent in all territory East of the Mississippi, Ohio and Detroit Rivers in the United States and Canada, the only varnish drying process that simultaneously subjects the coatings to the action of moisture in excess of natural humidity.

We also manufacture the Nichols Lumber Dryers, Veneer Dryers and Hydraulic Pumps. It will pay you to address us for further particulars.

Increasing speed and reducing costs while making certain highest quality work, in your finishing room with the

DeVilbiss Spray-painting System

Whether you manufacture phonograph cabinets or chairs, metal cabinets or brass beds; whether you varnish, enamel or lacquer those products, one DeVilbiss spray operator will do 4 or 5 times as much work as a brush finisher in the same time.

On every class and grade of work the sprayed-coating will be of highest, uniform quality—free from brush marks, runs, fatty edges and like faults.

DeVilbiss exhausting equipment will insure a clean, healthful place in which to work, and reduce the fire hazard.

The outfit will be on the joh every day, and cost little to operate and keep up.

These savings and advantages can be had in your finishing room, in the same profitable degree they are now enjoyed in thousands of wood and metal-working plants of every kind.

Let us mail you furthur particulars that meet your individual requirements

VENEERS

Veneers and Panels

Veneer Adds Value to Classic Pieces

World's Most Famous Masterpieces Made of Veneer—Practice Dates Back to Earliest Times—Big Factor in Furniture Industry Today.

by William Clendenin, Conover-Mooney Co., Chicago.

Veneer and plywood circles are all agog in view of the big $50,000 campaign of advertising soon to be launched in certain of the leading magazines and trade press reproducing illustrations of some of the finest historic pieces of furniture in existence which research discloses are veneered. We reproduce some of these classics herewith and they are well worthy of

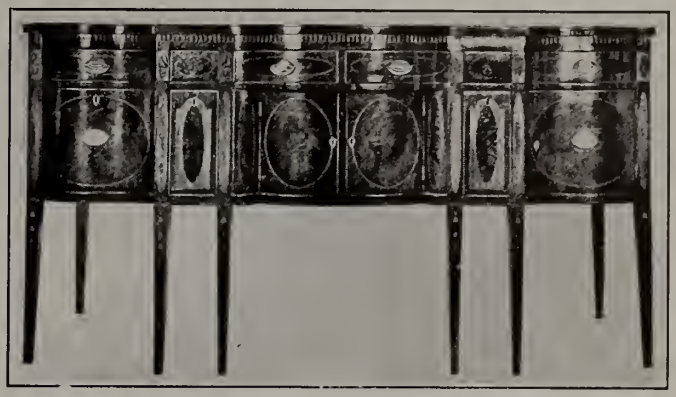
Famous Shearer sideboard made especially for the Bank of England.

the attention not only of the furniture craft generally, both manufacturer and retailer, but of the public as well.

We are indebted to William Clendenin of the Conover-Mooney Advertising Company of Chicago for most of the material of this article. Mr. Clendenin conducted the research work for the Veneer & Panel Association as a result of which the plywood interests united with the veneer on a 50-50 basis and, instead of dropping the word "Veneer" from the trade vocabulary, decided to launch an educational drive to disabuse the public mind of its erstwhile prejudice against veneer—and in this way carry the message to Garcia.

Dates Back Into Antiquity

In a special report to us Mr. Clendenin says: "Not in my whole experience in research work did I ever encounter more discouraging difficulties in the beginning and more complete success as the investigation proceeded. It may be imagined with what surprise we discovered that veneer work instead of being a modern innovation, harks back literally to the dawn of time. In an old English book I found in a foot



Beautiful Sheraton sideboard—Veneer construction used

note a small cut of a mural decoration taken from the wall of the tomb of the Pharaohs of the Exodus, showing in detail the process of veneering in the year 1490 B. C. The authenticity of this illustration is beyond question and an examination of it reveals not only the basewood of sycamore but the surfacing of fine veneer of some more pretentious wood, the glue pot over the fire—the hot sand bags, etc. Subsequent investigation discloses that the ancient Egyptians understood veneer and plywood construction almost along modern lines. There still survive fragmentary specimens of Egyptian veneer work, and it is now known that plywood was used by Rameses in the building of his long boats with which he thrashed the world in those ancient days.

"From Egypt the allied arts of plywood and veneer crept westward through the workmanship of the Babylonians, Persians, Greeks and Romans. The throne of Sennacherib was veneered. One of the

Mahogany bookcase designed by Sheraton for "The Times"

proudest possessions of Tiberius Caesar was a veneered table and Pliny tells us that Cicero paid $45,000 (gold coin of Rome) for a veneered table of citrus-wood. Pliny expatiates at length upon the beauty of veneer and describes in detail the wonderful figure effects obtained by its use such as the panther tables,

Bureau de Campagne of Napoleon

the tiger tables and the table tops whose designs resemble swarms of bees. In still a later book Pliny goes into a paroxysm of wrath denouncing the then practice of using gilt and paint, and he has his "mad" up not because gilt and paint were not handsome enough in their way, but because they covered up the beauty of the veneer.

Common to all nations and all ages

"In this way the story runs through the annals of ancient arts and crafts of nearly all the nations of the ancient world, reviving again with the Renaissance in Italy and sweeping then through France and the Netherlands into England and finally to our own America—the most magnificent furniture creations during each of these centuries having been executed in veneer. For instance, the most sumptuous piece of furniture in the world to-day, the Bureau du Roi, an illustration of which is herewith reproduced, done for LouisXV at a cost of half a million, and which required nine years in the making—was veneered. Indeed, the solid furniture construction has been almost consistently relegated to the barbarians—the Goths, the Vandals and the Huns who hewed their furniture from the solid block, scarcely any of which survives, whereas we have still the classics of veneer intact after the lapse of centuries.

"Napoleon knew a thing or two, and the famous "bureau de campagne" still preserved at Malmaison near Paris, is veneered. This piece is a collapsible cabinet done in rosewood with bands of hollywood. The front, sides and back are veneered. The magnificent writing cabinet and bookcase of Dean Swift preserved in Dublin is a splendid specimen of superb walnut veneer as is also a similar piece formerly the property of Sir Joshua Reynolds. Still another is the beautiful writing cabinet or escritoire, formerly the property of Marie Antoinette. "Francis I of France, dubbed by the cardinal, "king of the Renaissance" induced the best artists of Italy to come to Paris and with that sponsorship began the handicraft of veneer in Western Europe. The palaces of the Louvre and the famous museum of Cluny abound with specimens of their art.

Used and Recommended by Old Masters

"The English Schools and periods soon followed suit and it may come as a surprise, even to the better-informed reader, that Gibbons, Shearer, Hepplewhite, the brothers Adam, Chippendale and Sheraton himself employed veneer in the very choicest of their creations. Shearer executed a magnificent sideboard for the Bank of England which is still preserved. A copy of this is here shown. Sheraton's classic for the London Times is another supreme specimen of veneer as employed by that master of the craft. Innumerable photographs of veneered chairs and bookcases done by Chippendale have been remarkable in the course of our research as background and illustrative material for our advertising campaign. Sheraton even went so far as to set forth in his books elaborate instructions for the proper laying of panels and instead of veneer being a despised counterfeit, or a substitute camouflage, as is mistakenly supposed by many, it is and has been from the beginning, a fine art of the highest order and recognized as such by the foremost producers of fine furniture in every land and in almost every period.

"The writing desk of George Washington was veneered. The magnificent sideboard ordered by John Hancock for his new home in Boston was veneered. The desk upon which Thomas Jefferson wrote the Declaration of Independence was veneered. The little writing desk of Dolly Madison was veneered. They still show you an old desk once the property of Daniel Webster and now preserved at the Wayside

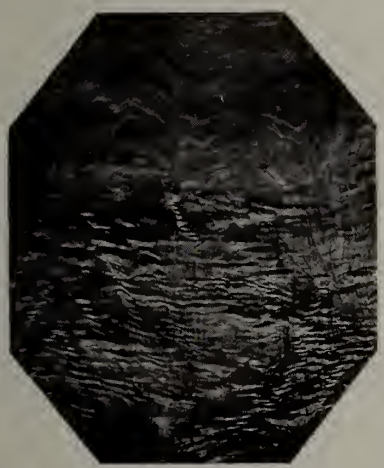
The Bachman Plant —and the Bachman Product



A sample of beautifully figured Walnut Stump Wood

Here, in this large and fully equipped plant, Bachman quality veneers are made. Our extensive yards are piled high with carefully selected, choice Indiana White Oak, Walnut and Gum.

Bachman veneers are cut full thickness, which means plenty of wood for sanding and a minimum of breakage in handling.

Bachman's forty years' experience in hardwood sawing is evidenced in every piece of veneer that leaves the plant. The sawed stock can scarcely be told from the sliced.

These are a few of the reasons why our customers tell us they get *fifty per cent. more panelling out of Bachman veneers* than they can from average veneers.

It is this unchanging high standard, both as regards materials and workmanship, that has made possible forty years of successful business. It is your assurance of the utmost in quality and service.

No order is too small to receive our prompt and careful attention—none too large to be handled to your entire satisfaction.

VIEWS OF OUR PLANT No. 4 H.G.W. Del

ALGOMA *the Better* Plywood

We welcome the man from Missouri

This is a message to the man who "has to be shown." There's nothing we should like better than the opportunity of proving to you that Algoma is the Better Plywood. Set your own standards or follow ours. Make your test as rigid as you like, and see if this plywood does not make good.

Our tests are these: *Surface*—permanently smooth, does not require re-sanding. *Graining*—skillfully matched and free from blemish. *Gluing*—uniform and everlasting. *Cutting*—accurate in each dimension to a fraction of an inch. *Delivery*—as speedy as a large, efficient plant can make it.

Be a regular skeptic if you will—but give us one opportunity to prove our case. Order your next plywood from Algoma.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

How Stiff is Your Spine?

"A little factory was started in a small town in Georgia," says a writer in Printer's Ink. "The owners were good workmen and knew how to make a cheap staple article, but they knew little of costs or of the market. When the factory got going they sent out a saleman who travelled all over the South and sold these staple goods at 20 to 30 per cent below the market price.

One big Atlanta house heard of this competition and met the price. Then a Chattanooga salesman reported that Atlanta had cut, so Chattanooga met Atlanta. Memphis met Chattanooga's price, and then New Orleans and Nashville met Memphis, and so on until the entire product of this staple was sold at a loss. After the first cut, nobody remembered who started the fire. At the end of a year—after one million dollars' worth of this staple article had been sold at a loss—the little factory that started the trouble failed, and it came out in court that their total sales for the year were only $$22,000!"

Your business is "different" of course, But: When a little one-horse competitor starts cutting prices, do you have to follow suit? When the buyer tells your salesman "I can get better terms from So-and-So," does the salesman wilt, or can he stand up to it? In other words, do your competitors and your prospects regulate your prices and terms, or do you regulate them yourself?

To put it more briefly--How Stiff is Your Spine?

Accidents Not Always Accidental

It sometimes occurs that delays and breakages which seem accidental are the result of a grievance, whether imaginary or real, on the part of some employee.

A sawmill at Smith's Falls, Ont., was bothered for several weeks with a number of seemingly unexplainable breakdowns. Belts broke mysteriously. Something was seemingly going wrong with the equipment every few hours. Parts of the machines became loose, dropping off and often doing considerable damage. Finally it was suspected that these were not altogether accidental, and a watch resulted in placing the blame upon a youth who had been but recently employed in the plant. It seems that this young man was being forced by his father to work in the sawmill, and, disliking the work extremely, took this method of obtaining relief. It is probable that Alex. Root, the lessee of the mill, will collect a bill of damages from the father of the boy.

A tightening pulley on the belt is better than dope or a slipping belt, but one which is wide and heavy enough to carry the load is better than dope or a tightening pulley.

THE BEST IN THE WORLD

The Standard Veneer Co.
Portland, Maine

Emerson Says—

"If a man can write a better book, preach a better sermon, or make a better mouse trap than his neighbor, though he build his house in the woods, the world will make a beaten path to his door."

Altho' we have only been in business for the past eighteen months we can see unmistakable signs of the beaten path already.

The Answer is:—
WE DELIVER THE GOODS.

R. R. May Hardwood Co.
LOUISVILLE, - - - KY.

THE loss through degrading, the time wasted and the uncertainty of knowing whether or not the work was done right, which in former years attended transit kiln-drying, can be eliminated by use of the 500,000 feet capacity modern kilns of the Wood-Mosaic Company at Louisville, Kentucky. These kilns were designed and erected after many years' experiences and exhaustive investigations. They are manned by intelligent and carefully trained operators. The results on the many millions of feet already dried have been scientifically checked and found correct. Under a very favorable transit arrangement a percentage of their capacity is offered to shippers who want to *know* that their lumber is perfectely kiln-dried. We offer our own stock either kiln-dried in the same efficient manner, or properly air-dried in quartered and plain white oak, in walnut and in other hardwoods. Our sawed white oak veneers, sliced and rotary cut walnut, rotary cut yellow poplar cross banding are just as carefully made and dried. The stock of both lumber and veneers still permits a good selection if you act soon.

WOOD-MOSAIC COMPANY

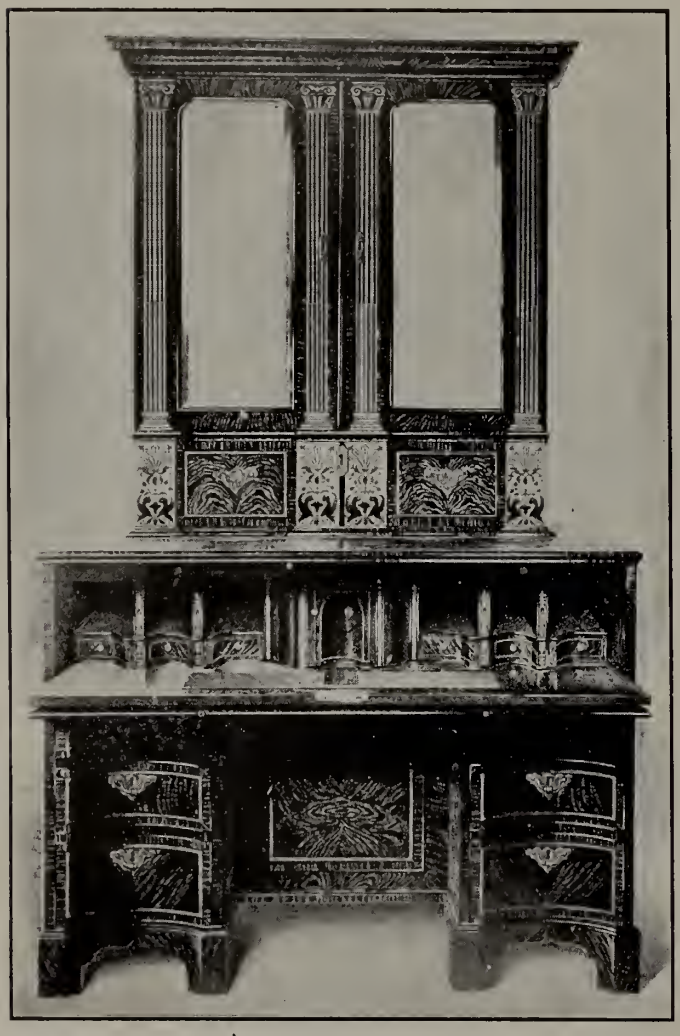
LOUISVILLE INCORPORATED KENTUCKY

Veneer Adds Value to Classic Pieces

Continued from Page 88

Inn at Sudbury, Mass., and it is veneered. This is easy to understand when we remember that the finest furniture of our forefathers was imported from England at the height of the Chippendale, Hepplewhite and Sheraton periods and their art was naturally followed by the craftsmen of New England who did the best they could to imitate it. Collectors of old furniture need no detailed description of the priceless examples of veneer which have found their way to America and are to-day the treasures of many of the oldest and most famous families of the United States.

"It will be readily appreciated what a wealth of material these classics will supply for our advertising



The Dean Swift writing cabinet and bookcase—Walnut veneer

campaign and we seriously doubt if so complete an exhibit has ever before been assembled on this or any equivalent line. It is conclusive of the fact that Veneer has had the sanction of art and artists always, and the general public needs but to be reminded of it all in order to restore veneered furniture to popular preference.

Plywood to Receive Equal Attention

"Hand in hand with the veneer feature of our campaign we shall treat also of plywood and the extraordinary economies in its manufacture introduced in the plywood factories of this country. Part of every ad and all the follow-ups will be devoted to a brief discussion of plywood and its rapidly extending uses and potential uses. Among these may be prominently mentioned the marine field and the fact that bulk heads, partitions, upper deck constructions and the like are now being specified in plywood. Recently the police department of the city of Chicago ordered the bodies of patrol wagons to be built of plywood, they having been found upon test to be not only superior to steel in lightness but also bullet-proof and bandit-proof. Wood cuts are now almost exclusively built up on the plywood principle. Panel work is being standardized in plywood with fine surfaces of rich veneer. Automobile wheels have been constructed and are being found practical even in dished formation—of plywood. These and many others besides automobile and aviative construction are of plywood.

"Expert reports from technical institutions definitely affirm the superiority of plywood because of its resiliency and stamina of construction. The grains of the alternating layers being at right angles and the plies bound together with glue under heat and pressure to give resistance to shear and stress superior to any other construction known. The plywood feature therefore, becomes of constantly increasing importance and the wonderful progress in perfection of veneer work in the Western World makes altogether a subject for advertising which it is believed cannot fail to impress and influence the buying public in a substantially constructive and profitable degree.

"Much is expected of this campaign and in view of the extraordinary exhibits, tables, facts and figures which have been adduced in support of it, it may be reasonably predicted that as an educational movement, the campaign can hardly fail to take high rank."

Little Time Losses

The importance of little things is often overlooked. When a workman is two or three minutes late for work or loafs that long during the day, he does not think very much of it, but if each workman in the plant loses the same amount of time, the loss of time begins to assume larger proportions. Then if this is multiplied by 300 days, it looms up as a serious item.

This point was brought out in an article which appeared recently in the "Curtis Circle," the house organ of the Curtis Companies, Incorporated. This item is as follows:—"For round numbers let us assume that there are 2000 employees in the Curtis Companies. If each one of them were to waste 5 cents worth of the company's time to-morrow, the total waste for the day would amount to $100.00. This would grow to $600.00 in a week, and figured on a yearly salary basis, would mean a loss of $30,000. Just 5 cents of lost time per day per employee, it seems small, in time it would not be much more than 6 or 7 minutes, yet figured on a yearly basis, it amounts to $30,000 a year."

It is startling how important little things become when looked at collectively or in their true perspective. The success of any industry depends as much upon the efficiency and ability of the employees as on the policy and judgment of the management.

The average workman imagines that the managing part of a business is the softest job in the works. He is mistaken, as it takes brains and real executive abilities to make success of any business.

We are prepared to quote on anything in Hardwoods for shipment direct from the mills in car lots, and solicit your inquiries. We are cutting Gum, Chestnut, Walnut and Mexican Mahogany, and have dry stocks at Jackson, Tenn. and Indianapolis, Ind.

What Causes Defects in Veneered Stock

Causes Not Always Obscure or Hard to Find—Glaring Mistakes Countenanced in Many Plants—Good Plan to Place Blame Where it Belongs

By R. N. Y.

What causes defects in veneered stock? This is a question, which if it were possible to give the correct answer, would mean the eliminaiion of the scrap or cull pile of the average glue-room, and a material reduction in the price of the finished product. Since the advent of veneered or built-up work, a perfect product has been the ambition of every glue-room foreman. Despite all precautions taken to overcome defects we have found and still find, veneered work which is defective. We will briefly discuss some of the causes that often result in the best work proving defective a short time after it has left the glue room.

How Many Operations For Five-ply?

Writers for some time past, and men well versed in veneering operations, continually harp on the subject of gluing up these five-ply stock in two operations From their point of view their contention may be alright. This, however, is not saying that if a five-ply panel is glued up in one operation it is bound to go bad. Far from it. I know of several plants turning out five-ply stock, in one operation, and they have considerably less trouble with their stock than some of the glue-rooms which adhere to the plan of two operations for five-ply. Personally, in my experience as glue-room foreman, I have never considered it necessary to make two operations of a five-ply job, and I daresay I have had considerably less trouble with my stock than they have in plants where the two operations for five-ply plan is in vogue.

My reason for doing this work in one operation is this,---when you build up a five-ply panel in two operations, you set up all the stresses and warping tendencies at each operation. Consequently despite all the precautions you may take against the panel going wrong or warping, your chance for setting up a warping or twisting stress, is just increased 100 per cent. Now take this same panel and complete your gluing in one operation and your warping tendencies are combined in that one operation. With one operation in gluing, all the tendencies to warp are present only once, and when the glue sets, it is not again disturbed with the result that little or no warping occurs if the panels are put through the proper drying process.

A chestnut core, with whitewood crossbanding and mahogany or walnut faces, would be an ideal combination work. Of course paper would have to be laid between the faces to prevent sticking together.

Starving the Glue Joint

It is safe to state that more veneer work is spoiled through glue starvation than from any other cause. If the glue-room man happens to waste or have a little glue squeeze out when putting his stock under pressure, he is often accused of wasting the company's money. However, if the manager would only realize what money is wasted through increasing the cull pile of veneered stock, he would probably change his tactics.

It is true, glue does cost money, but so also does the stock that is spoiled on account of the glue starvation. To play safe the glue-room man should be allowed to use his own discretion. It is far safer to use plenty of glue on the crossbanding and face veneers, even though some is squeezed out when in the press, than to spoil several panels or perhaps the entire lot. When you see glue running down the sides of a bunch of panels, it does not necessarily mean a waste of glue, as one panel spoiled would often pay for a lot of glue waste, considering the small amount that is really wasted in this manner.

If any defective veneer work occurs it is generally thought that the glue-room man is becoming careless and that a change of glue-room men would be for the best interests of the firm. This, however, in the majority of cases is a gross error. The majority of glue-room men would rather lose part of their week's wages than have some of their work turned out, go wrong.

Faulty Joints Responsible

The experience of a plant operating a veneering department in which the waste on the glued-up stock totalled over 15 per cent, may be of interest. The stock would seemingly leave the glue room in good condition; yet when the parts were being assembled fully 15 per cent of the panels were laid out as defects. Finally an investigation was made and this is what the investigation developed. Instead of testing his joints against light, the man taping these veneers was trusting to good luck that they were O. K., with the result that many panels were laid out on account of open joints. When he was instructed to examine every joint and that henceforth he would be held responsible for all defects of this kind, the trouble ceased.

Sanding through the face veneers was another source of trouble. The sander man laid the fault on the glue-room man, claiming that the panels were not flat on the ends. Investigation showed that the men taking stock off sander would lift up the panel when nearly through the sander, which caused the face veneer to be sanded through on many panels. When the sander crew was told that in the future they would be held responsible for such trouble, thereafter, strange to say, it was rarely that the face would be sanded through.

Trim Sawyer to Blame

At the trim saw many panels were found that had short veneers on. The trim sawyer blamed this on the glue-room man. Investigation, however, proved that while a few panels had veneers that did not cover the cores, this was greatly increased by the trim sawyer who was cutting from two to five panels at a time, not taking time to gauge the panels so as to trim those properly where the veneer had slipped a trifle. The remedy was obvious. The trim sawyer was told to equalize the cut so as to make the veneer cover the core on which it had slipped. While the glue-room was responsible for the slippage of veneers, this nevertheless did not permit the trim sawyer to try to run this percentage as high as he could.

HAY & CO., Limited Woodstock, Ont.

The Lumber Market

Domestic Woods

The local lumber market is still in the throes of stabilization. The demand for certain items has shown a distinct improvement during recent weeks while there is little call for other lines. Naturally prices are reflecting this movement. The cry of better business has gone forth and the future is being regarded with greater optimism. Sales cannot be said to approach anything like normal, and, in fact, are not expected to until spring, but the change from the unsettled conditions of the past months to one in which there is a demand for wood and wood products, is most encouraging. The lumber business is still spotty but the tendency is toward a steadier market. The consensus of opinion seems to be that the total volume of lumber sales made during October was greater than for any month during 1921.

Local hardwoods are moving more freely, furniture factories and other wood-consuming industries are coming into the market and the demand for birch, maple, ash, elm, chestnut and oak is stronger than has been experienced for many months. That being the case, it is only natural to expect a greater stability with regard to lumber values; in fact prices on several lines, and particularly on the better grades, are advancing. The buyers coming into the market to-day mean business. They realize that now is the opportune time; in fact they realize that they have delayed their buying a trifle too long. As a consequence there is less bickering over prices. It is a case of procure the stock at a fair market value. As yet the call is chiefly for the better grades but the lower items are gradually feeling the increased pressure.

In the softwoods white pine exhibits greater activity than it has for some time although this wood has held up well during the whole season . Hemlock is evincing a tendency to stiffen in price, and it would appear as if values in this wood have reached and passed the low market. Several sales running into millions of feet are reported. It is problematical just what the future holds, though the general impression has been that business in general will show a slow but steady improvement. That being the case, the demand for lumber should be fairly steady. With anything like a normal demand during 1922, lumber value will, probably, stabilize at a point considerably above to-day's quotations. Stocks of all woods are none too plentiful. This would seem to indicate a shortage in certain lines if the demand improves and holds.

It is difficult to predict what the cut for the coming season will be although those who are in closest touch with the situation are of the opinion that in Ontario it will amount to 50 to 60% of last season; 30 to 50 % in Quebec; 25% in New Brunswick and 20% in Nova Scotia. However, as time goes on, if the demand for lumber remains on a satisfactory level, it is possible that many operators, not intending to go into the woods, will decide at the last minute that there will be a fair market for anything they might take out, and put their crews into the woods. For the same reason some of the loggers and sawmill men, who contemplate cutting on a reduced scale, may decide to increase their operations. Another factor that should be considered is that on a falling market there is a tendency to curtail buying, orders being placed on a hand-to-mouth basis. When this condition changes the reverse holds true and many rush in and buy to cover for future requirements. This may happen during the next few months. For this reason it does not seem to be a wise policy to postpone the purchasing of needed material for any extended period.

Imported Woods

The demand of American hardwoods continues to show an improvement, with the result that the upward trend of prices, which was noticeable at last writing, is now more marked. The stocks of all the better grades are very low and there is keen competition between buying interests for such material as is available. In addition to the improvement in buying on the part of domestic users, several good-sized orders have been placed for shipment overseas. It is estimated that in the past fortnight over 10.000, 000 feet have been secured by export buyers. The local demand comes from all sections of the wood-using industry, which would seem to indicate that the slight improvement which has taken place in general business is being reflected in all branches of the woodworking industry.

A number of lumber firms in the southern producing districts report that they are practically out of all grades above No. 2 common and that their stocks of No. 2 and No. 3 common are being depleted at a rapid rate. Those who have lumber for sale are not making any attempt to push sales, being content to wait future developments in the belief that lumber prices are bound to advance to a considerable extent during the coming six months.

There does not seem to be any doubt but that as far as lumber is concerned, the low point was reached in August and that since then there has been a change for the better as far as demand is concerned, and a greater stabilization of lumber values. When one considers that owing to the fact that production is at a very low ebb, probably 15% of normal, that logging operations have ceased in many districts and that it takes about six months before logs felled at the present time, can be manufactured and dried to shipping condition, it would appear as if the prospect of lumber being scarce during the next twelve months, is almost a certainty.

It is expected that the gradual increased demand for hardwood lumber and the higher prices which are prevailing, will tend to stimulate production, but on the other hand, it is pointed out by those who are in close touch with the situation, that the logging crews are widely scattered and that the logging equipment which has been laid up, cannot be put in operation on a day's notice; indeed it is emphasized in some quarters that even with a continuance of favorable weather for the whole of the present month and a good part of December, the chances are against an accumulation of any considerable supply of logs.

Summing up the whole situation, it would appear as if a buy now policy is the only one to adopt. While the increased demand has been largely for the upper grades, yet it is gradually reaching the cheaper items. If the present activities continue for any extended period, and there does not seem to be any reason why they should not, all items will be scarce and hard to secure in the course of a month or two.

WHAT about your future hardwoods? It is obviously no time to preach Lumber "shortage" and we have no such purpose. But it is true that practically no lumber is being made and present shipments are slowly, but surely, wearing down stocks. It is only a question of time when there will be nothing left but a broken lot of low grade for there is no physical possibility of measurably increasing production for many months.

Now comes the easing of the cotton situation—releasing the money with which to carry present mill stocks. Our judgment is by no means infallible, but doesn't it look to you as though these circumstances would make it a logical time to buy at least a moderate stock? We have further information that would be of vital interest to any lumber buyer who will address us.

ANDERSON-TULLY COMPANY

MEMPHIS TENNESSEE

News of the Trade

The Ontario Show Case Co., 321 King St., Toronto, are installing a new boiler.

The Comet Washer Co., London, Ont., are erecting a factory at a cost of $3500.

The Spiesz Furniture Co., Limited, Hanover, Ont., are installing a C. M. C. double-end tenoner.

The Simpson Planing Mill Co., Spadina Ave., Toronto, recently installed a C. M. C. chain mortiser and Greenlee sash relisher.

J. Walkom recently passed away at his home in Stratford. He was one of the partners of the Perth Carriage Works, Stratford, Ont.

Edward Van Eck, representing the Kane Mfg. Co., Chicago, recently called on the Canadian trade and found conditions very satisfactory.

The Owen Sound Chair Co., Limited, Owen Sound, Ont., have commenced work on a 20 x 50 brick addition, to be used as a bending room; cost $3000.00.

The Grimsby Steel Furniture Co., Limited, Grimsby, Ont., have secured a site on which they propose to erect a plant to manufacture ice cream parlor and restaurant furniture.

A report recently issued by the Montreal Association for the Blind, shows that 356 cane chairs and 50,000 brooms were manufactured during the past year by the pupils of this Association.

P. E. Shantz, Preston, Ont., manufacturer of baby sleighs and factory trucks, reports business as being very satisfatcory. His plant is being operated to capacity with a full staff of employees.

The James Brooks Woodworking Co., Limited, New Westminster, B. C. have been awarded the contract for the millwork for the new nurses' home which is being erected at Tranquille, B. C.

A. E. Malcolm, of the Andrew Malcolm Furniture Co., Limited, Listowel, Ont., was recently nominated as a Liberal candidate in the forthcoming federal elections. Mr. Malcolm is at present mayor of Listowel.

The Canadian Sawdust Co., Limited, Montreal, were incorporated recently to carry on a general woodworking and contracting business capital $100,000. F. B. Common and F. G. Bush are two of the incorporators.

Meredith Simmons & Co., Limited, Toronto, were recently incorporated to manufacture and deal in glues and other adhesives; capital $50,000. J. S. Beatty and J. R. Rumbell, Toronto, solicitors, are among the incorporators.

The hockey stick factory operated by E. B. Salyerds at Preston, Ont., was recently destroyed by fire. The factory and equipment are a total loss. The damage amounts to about $30,000. and is partially covered by insurance.

Giles, Rice & Peters, Limited, Toronto, were recently incorporated to manufacture and deal in motor vehicles of all kinds, and to take over as a going concern the business now being conducted as Giles, Rice & Peters; capital $100,000.

Synder Bros., Limited, Waterloo, Ont., were recently incorporated to manufacture and deal in furniture of all kinds, and to take over as a going concern the business now carried on by Synder Bros. Upholstering Co., Limited, of Waterloo, Ont.; capital $600,000.

The Toronto Saw & Tool Co., Limited, were recently incorporated with a capital of $400.000., to manufacture and deal in saws and tools of all kinds. C. H. Kehoe and W. W. Fair, barristers-at-law, Toronto, are among the incorporators.

John Hanbury, the well-known sawmill operator of Vancouver, B. C. recently visited Brandon, Man., where he made arrangements for the reorganizing of his sash and door factory at Brandon, with a view to putting it in operation in the near future.

Victorian Case Company, Limited, Toronto, have been incorporated to manufacture and deal in furniture and fixtures and all kinds of wooden cases. Capital $40,000. Two of the incorporators are N. Philips and I. Finberg, solicitors, both of Toronto.

The Mutual Corporation, Limited, New Birks Building, Montreal, have commenced work on an extensive building programme calling for the erection of 1700 houses at a cost $6.000. each. A contract for a block of 100 buildings has been let to Anglin-Norcross, Limited.

The Everett Mfg. Co., Limited, Sault Ste Marie, Ont., are erecting a woodworking plant for the purpose of manufacturing such articles as ironing tables, clothes dryers, stepladders, long ladders, etc. Employment will be given to about six men at the start, and it is expected that this number will be rapidly increased.

The Canadian Billiard Table & Supply Co., Limited,, Toronto, were recently granted a provincial charter to manufacture and deal in billiard tables, bowling alleys, phonographs and all kinds of furniture fixtures and cabinet work. Capital $25,000. J. S. Lovell and R. Gowans, both of Toronto, are two of the incorporators.

Ellwood Wilson, manager of the Forestry Division of the Laurentide Co., Limited, in addressing the Engineering Institute of Canada, at Ottawa recently, intimated that a paper age was looming up on the horizon. Pulp and cardboard rugs, pulp and paper furniture, wall hangings, boxes, barrels and milk bottles, were all coming in the near future.

E. B. Salyerds, Preston, Ont., whose hockey stick and brush factory was recently destroyed by fire, has taken over the plant formerly occupied by the Canada Machinery Corporation, and will put in the equipment necessary to carry on the manufacture of his line. Mr. Salyerds has secured a lease of this building and will resume manufacturing operations at the earliest date possible.

The Canada Car & Fondary Co., Montreal and Amherst, has received a contract from the Canadian National Railways for repairing 1000 cars. Half of this work will be handled at the Amherst plant, while the balance will be undertaken by the Montreal branch. The amount involved is in the neighborhood of $1,000,000. It is anticipated that when these works are once re-opened and put into operation, enough work will be forthcoming to keep them going indefinitely.

Gem Crib & Cradle Co., Limited, Kitchener, Ont., have been incorporated to manufacture and deal in childrens furniture and childrens vehicles and to take over as a going concern the business known as the Gem Crib & Cradle Co., capital $40,000. F. C. Brandt

International Job Time Recorders

eliminate the non-productive minutes

These non-productive minutes, representing the difference between the purchased labor and the actual productive labor, are one of the largest factors that control your profits. They represent a dead loss that cannot be reclaimed.

Will your present system of time-keeping eliminate them? If not, you owe it to yourself and your business to investigate the system that will do it.

Hundreds of manufacturers have reduced the difference between their purchased labor and productive labor by the installation of International Time Recorders and International Job Time Recorder. The records which they give you are made by the workman himself, are printed and unchangeable and therefore promote confidence between employer and employee.

Let us tell you more about them—how they have been adopted by other manufacturers of wood products, and demonstrate their benefits to you.

Those manufacturers have proven the great saving from our machines. If they are "right" you, Mr. Non-User, must be "wrong" and it must be costing you a lot of money.

LIMITED

F. E. MUTTON, Vice-President and General Manager

Head Office and Factory: 300-350 Campbell Avenue, Toronto

HALIFAX, 44 Granville St. ST. JOHN, 29 Dock St. QUEBEC, 506 Merger Bldg MONTREAL, 1 and 3 Notre Dame St. OTTAWA, 190 Queen St. TORONTO, 409½ Yonge St. HAMILTON, Room 8, 36 James St. S. LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd WINNIPEG, 227 McDermott Ave. VANCOUVER, 230 Cambie St. SASKATOON, 254 Third Ave. S.

Also manufacturers of International Dayton Scales and International Electric Tabulators

and W. Brandt, both of Kitchener, Ont., are two of the incorporators.

Alder & Karasinsky were recently registered in Montreal as cabinet makers.

Boulette & Son, Manigotagan, Man., have commenced work on an up-to-date planing mill.

R. Lathan, Ottawa, Ont., has taken over the carriage factory formerly operated by P. Armstrong.

T. Clements, manufacturer of toys, Toronto, has been succeeded by the Earlscourt Toy Works, Limited.

Wilson & Grier, Montreal, P. Q., were recently registered as pattern makers with John Wilson and J. F. Grier as partners.

Nelson Gilbert recently passed away at his home in Brockville. Mr. Gilbert was connected with the N. Gilbert Boat Co., Brockville, Ont.

The Eastern Billiard Table Co., Limited, Montreal, P. Q., were recently granted a charter to manufacture and deal in billiard and pool tables of all kinds.

The Sherlock-Manning Piano & Organ Co., London, Ont., report a decided improvement in the demand for pianos and expect shortly to be operating under normal conditions.

At a recent meeting of the shareholders of the Canada Factories, Limited, permission was given the contractors to dispose of the Brockville plant if the opportunity presented itself.

The Radford, Wright, Wilson Co., Limited, Winnipeg, Man., have been awarded contracts for the woodwork for a garage and a number of stores which are being erected in Winnipeg.

Col. A. W. R. Wilby, B. C. Agent for the Canadian Government Merchant Marine, recently announced that the Dominion Government had decided to continue the building of wooden ships at Victoria, B. C.

The Lindsay Pleasure Boat Co., Limited, 916 Powell St., Vancouver, B. C., recently commenced work on a boat factory. The new building is to be one-storey 25 x 100 feet and will cost in the neighborhood of $3,000.

H. A. Hamilton, of Hart, Hamilton & Jackson, Toronto, wholesale lumber dealers, has retired from the firm. The business will be conducted by Hart & Jackson at the same address, 702 Bank of Hamilton Bldg., Toronto.

American Bed and Spring Company, Limited Toronto, have been incorporated to manufacture and deal in beds and springs; capital $40,000. Two of the incorporators are M. Tarnowsky and A. Starkman, both of Toronto.

Hart & Lefeber, Limited, Montreal, recently opened an office at 38 Grey Nun St. They propose to deal in veneers and panels and will also act as distributors for "Casco" Waterproof Glue which is manufactured by the Casein Mfg. Co. of New York.

The Western Implements, Limited, Winnipeg, Man., were recently incorporated to manufacture and deal in agricultural implements of all kinds; capital $500,000. C. A. Andrews and H. Brown, both of Winnipeg, are among the incorporators.

Latour & Dupuis, Inc., St. Jean, P. Q., have commenced work on a new sash and door factory and planing mill which is to be completed by June 1st 1922. The new plant consists of a two-storey building 120 x 96, and is of concrete and brick construction.

The Doherty Piano Co., Clinton, Ont., was recently put on a capacity production basis. This factory is being operated with a full complement of hands and twelve hours a day The present output is greater than at any period since this plant has been in operation.

The Canadian Vatu Drying & Woodworking Co., Limited, Sault Ste Marie, Ont., have been incorporated to conduct a kiln-drying operation and to manufacture and deal in furniture, boxes and other wood products; capital $40,000. J. A. Craig and W. J. Hall are two of the incorporators.

John R. Little, Manigotagan, Man., is negotiating for a site on which to erect a box factory and lath mill. Arrangements have been made with Boulette & Son for a supply of timber, and it is anticipated that as soon as a suitable site has been secured, that work will be commenced on the plant.

A by-law is to be placed before the ratepayers of Regina, Sask., to extend the fire limits west so as to permit the Regina Sash & Door Co. to construct a new factory which has been under contemplation. The construction of this building has been held up for a long time pending a settlement of this question.

L. L. Brown, Toronto, B. C. Lumber Commissioner for Eastern Canada, together with his wife and family, returned recently from a trip to British Columbia. Mr. Brown spent a delightful holiday renewing old acquaintances and while on the Coast delivered a number of important addresses before various lumbermen's associations.

The International Wheel & Rim Co., Limited, Toronto, Ont., were recently incorporated to manufacture and deal in automobile wheels and rims for wheels; capital $50,000. Negotiations are under way for a site in Toronto, and in the meantime it is just possible that production will be undertaken in temporary manufacturing quarters. An office has been opened in the Lumsden Building, Toronto.

A deputation of five blind men waited on Hon.Dr. J. D. McLean, provincial secretary for B. C. to see if the government would assist them in establishing a broom factory. It is hoped in this way to find employment for about a dozen men similarly afflicted. The deputation was sympathetically received and assured that the government would conduct an investigation into the possibility of such a proposition paying. Without giving any definite assurance, the impression was left that the government would do all in their power to assist.

The Fish curing industry of Scotland, of which Aberdeen is the centre, offers a market for barrel staves that is worthy of the attention of Canadian cooperage stock manufacturers. Before the war about 2,500,000 barrels were required annually. These consisted chiefly of white spruce and were of Scandinavian manufacture. The staves for fish barrels must be both air-tight and water-tight and are usually sawn but not dressed. The pre-war price was about 77s per M feet, while to-day's price is about £7 per M, delivered at Aberdeen. Fuller information on this market may be secured from the Commercial Intelligence Branch of the Department of Trade & Commerce, Ottawa.

The Merritt Engineering & Sales Co., Lockport, N. Y., have issued a new catalogue covering the Merritt line of veneer-cutting and basket-making machinery. Among the equipment listed is to be found the Merritt veneer lathe; veneer clipper; dimension clippers, crate head tenoners for plywood

One Reason why Kraetzer Cured Gum is Straight and Flat

Ask Your Factory Superintendents

You don't have to take our word for it ask your factory superintendent.

What? Why, how much stained or doty gum you are getting and what it is costing in waste, expense of removing and replacing unsound pieces put into work in the hope of "getting by" and minimizing waste, only to have it fail to pass inspection.

Do you know what stain is? It is what a headache is to you. A headache is only a warning of some derangement of one or other of the organs. Stain in lumber is only the visual evidence that decomposition has started within. How long did you suffer and "cuss" with headaches until you heeded the warning and had your eyes fitted with glasses?

Remember how beautiful the world became all at once

In just that manner, your worries cease and problems of production become simple when you heed Nature's warning and use GUM that is BRIGHT.

Of course, you can get Gum in this condition - at least, you can from us. We guarantee our KRAETZER-CURED Gum to be FLAT, STRAIGHT, and BRIGHT. Know it by the brand.

Your Protection

boxes; crate head cleat saws; bushel basket machines; knife grinders; hot plate redryers; hot plate hydraulic veneer presses.

Benson-Johnston, Limited, Hamilton, Ont., have been incorporated to manufacture and deal in office furniture and supplies; capital $500,000.

The factory and lumber yard of W. H. White, Ville St. Pierre, Que., has been completely destroyed by fire. The loss is $50,000, partially covered by insurance.

A good spindle guard not only reduces the chances of a workman cutting his fingers, it helps him do jobs with a surety that, if anything happens, his fingers will be safe.

Arnott & Sons, sash and door manufacturers, Vancouver, B. C., report that the local demand for their products is very strong and that they have all the orders they can handle.

The British Canadian Furniture Co., Limited, Vancouver, B. C., were recently registered as manufacturers of furniture, beds and bedding. The capital of this company is $200,000.

The Reo Motor Car Co. of Lansin, Mich., have secured a site and building at Walkerville, Ont., and plan establishing a plant for the assembling of their line of motor cars and trucks.

The H. A. Wood Mfg. Co., Belleville, Ont., has secured the Canadian rights for what are known as the "Alemite Products." Casters for furniture will be included among one of the lines to be manufactured in Canada.

It is reported that Dodge Bros., manufacturers of the well-known car bearing their name, have secured a site at Sandwich, Ont., and contemplate erecting a large plant to take care of both the Canadian and export trade.

Certain changes were recently made in the organization of the Sellers Kitchen Cabinet Co., Limited, Southamption, Ont. It is now being operated by the Durham Furniture Co. of Durham, Limited, under their own name.

The Da-Nite Furniture Co., Limited, Toronto, which was recently incorporated to manufacture furniture of all kinds, has been authorized by supplementary letters patent, to increase their capital from $200,000. to $1,000,000.

The exhibit of the North American Furniture Co., Limited, and the Owen Sound Chair Co., Limited, at the fall fair in Owen Sound was awarded the cup which represents the first prize for inside exhibits. The two companies made unusual preparations for this display and the decorations were of a most appropriate character. The feature of the showing was a complete dining room suite in Italian design, finished in antique Polychrome walnut.

Attractive Mahogany Desk

A very handsome desk was recently presented to the Toronto Board of Trade by the British Imperial Council of London, England. This was in appreciation of the way delegates from this council were entertained while in Canada last year. The desk itself is a very handsome piece of work. As will be noticed from the accompanying illustration, the predominant feature of the carving is the maple leaf. The inkstands are silver mounted and the inscription plate is also of silver. This desk was designed by C. G. Hare, of the firm of Bodley & Hare, London, W. C., and was made by A. W. Peacock, London, N. W. Needless to say, the members of the Toronto Board of Trade appreciate this attractive gift.

The Bankruptcy Act

SALE BY TENDER

In the matter of GEO. M. MASON, LIMITED, Authorized Assignor.

Pursant to the authority of the Inspectors of the above Estate, tenders are invited for the purchase of the following assets:

PARCEL 1. The Real Estate on the east side of Bayswater Ave., between Wellington and Somerset St., through to Breeze Hill Ave., in the City of Ottawa, consisting of 84000 square feet, more or less, together with all the buildings and plant thereon, including a large, fully equipped sash and door and general woodworking factory with sprinkler system steam and electric power, lumber storage sheds, railway siding, four frame houses &c.

PARCEL 2. The Real Estate adjacent to the above described parcel one, comprising a city block bounded by Bayswater Ave., Somerset St., Spadina Ave., and Wellington St., consisting of 56000 square feet, more or less, together with the buildings thereon used as Office and lumber storage sheds.

PARCEL 3. The Read Estate fronting on the Richmond Road in the district known as Woodroffe (a suburb of Ottawa) consisting of 54000 square feet, more or less, together with all the buildings thereon, including planing mill partially equipped, lumber storage sheds and office. Railway siding alongside.

PARCEL 4. The Real Estate, vacant, situate adjacent to the Bank St. Road and Village of Billings Bridge, a suburb of Ottawa, consisting of 57000 square feet, more or less, with tracks of C. P. Ry. running alongside

PARCEL 5. The Real Estate on the south west corner of Booth and Norman Sts., in the City of Ottawa, being 50 ft. x 50 ft. more or less, on which is erected a frame, part brick veneered, row of dwellings, known as Nos. 580-2-4-6 Booth St. This property is subject to a mortgage of $2500. at 7% which the purchaser may assume as part of the purchase price.

PARCEL 6. One Kelly motor truck, capacity said to be 2 tons.

PARCEL 7. One Kelly motor truck, capacity said to be 1½ tons.

Any of the above parcels may be inspected and further particulars received upon application at the office of the Trustee in the Jackson Building, Bank St., Ottawa.

Terms: Marked- check for ten per cent to accompany tender, which check will be returned if the tender is not accepted; forty percent in cash in thirty days from date of acceptance of tender and the balance in ninety days from said date, hearing interest at 7% per annum and secured to the satisfaction of the Trustee. These terms, excepting as to the deposit check, will not apply in the case of Parcels 6 and 7, which shall be cashed upon acceptance of tender.

Tenders for any one or more of the above Parcels will be received up to noon of Decemher 19th, 1921, addressed to the Trustee and marked "Tender re Estate of Geo. M. Mason, Limited."

The highest or any tender not necessarily accepted.

Dated at Ottawa, this 15th day of November, 1921.

GEO. A. WELCH, C.A.
Authorized Trustee.

Canadian Steel Trade Conditions

Conditions in the steel trade of the Province of Ontario are said to be better than they have been for months, though a large part of the current business can be described as special. Industrial requirements are growing, however, and order sheets show that business of a diversified character is being placed. Structural business is coming along better; motor-car manufacturers are looking critically to their stocks; oil producers are seeking pipe. Several manufacturers who normally use liberal quantities of steel are starting operations again within the next few weeks; others have recommenced operations within the past fortnight. Inquiries for steel indicate that a somewhat more active production schedule is in view. Railway rolling stock requirements, Ontario Transportation Commission orders, etc., are swelling the tonnage that is being booked by the sales agencies. There is still considerable competition for business.

Most interesting results were secured through a questionnaire sent out by a producer of steel products to his customers. The line of goods in question has a fairly general consumption by Ontario industries. Some of the largest companies did not commit themselves when asked as to the business prospects for the spring and winter months. Of those replying, 60 per cent were optimistic, 40 per cent leaned toward pessimism. An impartial examination would lead to the conclusion that some of the executives painted the situation too black. The proportion of 60 to 40 is fairly illuminating, however, indicating how business men are thinking.

Speaking generally, the moderate-sized establishment seems to have most optimistic views, so far as the metal industry is concerned. That may be partially explained by the fact that current business is chiefly of small dimensions.

Sash and Door Factory

For Sale

Location—St. Gabriel de Brandon, Berthier County, Province of Quebec.

Modern factory building with complete machinery and equipment for manufacturing sash and doors, butter boxes, moulding, etc. Well-equipped sawmill operated by steam and electricity. Excellent storage, one dry room and a two storey residence. Property occupies 63,000 square feet adjoining yards of Canadian Pacific Railway.

For immediate sale this property is offered at half its value.

Write or wire for further details and appointment to view.

POIRIER & FRERES,
St. Gabriel de Brandon, Que.

A New Departure in Staves

For years shippers of fruits and vegetables and the many other commodities which have been shipped in the slack barrel have sought a barrel that they could rely upon for durability, neatness and correct measure, says a writer in Barrel and Box. For years coopers have endeavored to furnish such a barrel at a price that woud appeal to their customers as being fair, but the coopers have been handicapped on account of the great variation in the general run of slack cooperage stock; stock that has been of such quality and lack of uniformity as to practically prohibit the manufacture of barrels that were in conformity with standard regulations, and in too many instances the quality of the stock has even prohibited the manufacture of a real substantial barrel; there has been great wastage not only in useable stock, but furthermore coopers have felt the wrath of their customers because of the lack of quality and lack of uniformity in barrels furnished. One big result has been the loss of many customers, who have thought it necessary to use competitive containers because of the poor service rendered by barrels.

The Crozed Stave Corporation, of Grand Rapids, Mich., has for some time been manufacturing what is known as the crozed stave, which if the claims of the manufacturer are to be considered upon their merits, places in the hand of the cooper the great opportunity to furnish his customers with high-grade barrels, of standard size, correct content measurement, and a durability that guarantees 100 per cent. service, and to furnish such a barrel at a no greater cost than current barrel manufacturing cost, in fact at less cost. The cooper is further offered the means of again regaining the trade that has been lost to the barrel, because he can furnish barrels that meet consuming needs.

Crozed staves are comparatively a new departure in the slack barrel line. They are cut, crozed, chamfered and equalized all in one operation, eliminating the need of crozing and chamfering equipment in the hand cooper shop. When jointed they are ready for assembling into barrels.

The croze is cut clean and deep, insuring a perfect fit to the head, with always the proper distance between heads, and the staves being of uniform thickness at the heads, insure the safe use of machine-made wooden or metal hoops, and aperfectly tight fit of the heads. This is also true in the event that thin staves are produced in cutting staves, as enough residue is left on the back side of the stave at the heads to insure this uniform thickness.

The Crozed Stave Corporation has a very modern plant at Boyne City, Mich., with a capacity for thirty million staves annually, producing at present staves from live, Northern hardwood. It is the finest and only plant of its kind in the world; electrically driven throughout, with extra heavy type cutters manufactured by the Rochester Barrel Machine Works, of Rochester, N. Y. One of the features of the equipment is the especially designed dryer, wherein staves are dryed by the vacuum process. The staves come from the dryer with a moisture content of 10 to 15 per cent, and are bright and clean, free from mold, wrinkles, splits, etc., and with complete retention of the original circle. They are jointed direct from the dryer, after which they are carefully graded, packed and ready for shipment. In fact, within 60 hours from the time the bolts are wheeled into the steam tunnels the staves are ready for use.

Information and Inquiries

You are cordially invited to make use of this department

Wants Dimension Material

St. Thomas, Ont., Nov. 2nd, 1921.
Editor, "Canadian Woodworker",

You have been devoting considerable attention recently to the question of dimension material. We are in the market for basswood dimension in carload lots as follows:------

1 in. x 2 in. x 24 in. or multiples of 24 in.
1 in. x 3 in. x 13 in. or multiples of 13 in.
½ in. x 6 in. x 13 in. or multiples of 13 in.

This material should be dry and can be either rough or dressed to pattern. Will be pleased to give full particulars to anyone in a position to supply this stock.

Sincerely yours,
Canadian Woodenware Co

Information on Kiln Drying

Katevale, P. Q., October 17th 1921.
Editor, "Canadian Woodworker."

Can you tell me if it is possible to kiln dry and manufacture lumber without it first being air-dried? If hardwood were kiln-dried direct from the log and manufactured into flooring, would it be necessary to re-dry it again after it has been run through the sticker? Should material for interior trim be dried before or after sticking? We find that the stock curls badly when run after being dried. How can this be overcome?

Any information you may give on the above subject, will be appreciated.

Sincerely yours,
J. R. Spendlove.

Kiln drying has been developed to such a degree that it is not only practical to dry stock direct from the saw but the drying losses are less than if the material had been air-dried for a year or more and then run through the kiln. By using a modern type of dry kiln, in which the humidity and temperature are subject to rigid control, you can bring any kind of hardwood down to the desired degree of dryness with a minimum of loss. If your material has been dried before machining, and it should be thoroughly dry, there is no need of any further drying after the flooring has been run unless it is stored in a very damp place or has been exposed to rain or water. The same applies to interior trim. The hardwood can be dried as it comes from the log, then run into trim and used without any secondary drying.

You ask if the trim be dried before or after planing, making the suggestion that kiln-dried wood curls if planed afterwards. Wood that is thoroughly and evenly dried should not curl through subsequent manufacturing operations. If any curling takes place, it means one of three things,—first,—that the stock was not dried to the proper percentage of moisture content; second, that it was not dried evenly, that is, that the centre or some other section contains more moisture than the surface; third, that the stock has not been treated properly in the kiln, and as a result has become case-hardened. The latter trouble can be overcome to a certain extent by steaming both during the drying operation and just before the material is taken from the kiln.

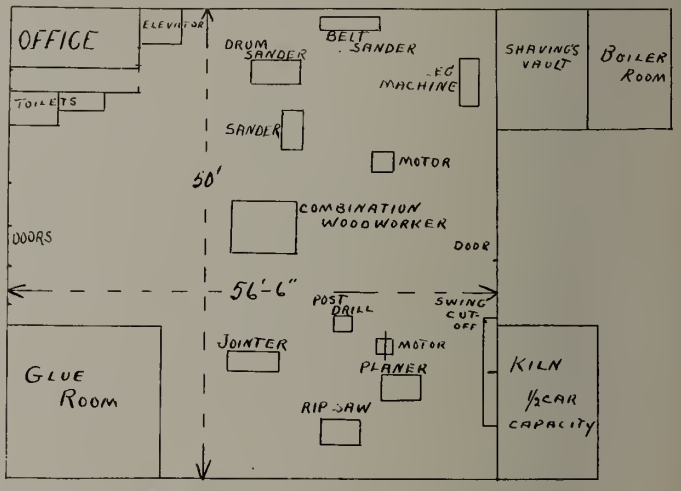
Layout of Furniture Factory

St. Helens, P. Q., November 4th 1921.
Editor, "Canadian Woodworker"

We are enclosing a rough sketch of a new factory we contemplate building, and would appreciate your opinion on the arrangement of equipment. What changes and improvements would you suggest, and why?

Sincerely yours,
H. L. N.

We are reproducing this sketch and would ask you to examine this carefully and send in what you consider to be an improved layout, giving the reasons



Suggested Layout for Furniture Factory

for any changes you may make. The arranging of machines presents many interesting problems, and the suggestions and experiences of other often come in very handy at a time like this. It will be interesting next month to compare the different layouts, which will be suggested by "Canadian Woodworker readers."

Book on Estimating

St. Catharines, Ont., Oct. 25th, 1921.
Editor, "Canadian Woodworker",

Will you kindly inform me where I could secure a book covering estimating for a sash and door factory and planing mill. What I have in mind is something that will give the quantity of lumber used in sash of various sizes, the number of bundles of lath for a room of given dimensions, and other information of a similar nature.

Sincerely yours,
H. I. L.

We do not know where a book of this kind is published; in fact we do not think there is such a book on the market. The Millwork Cost Bureau, 11 South La Salle St., Chicago, are bringing out a new course in which a considerable amount of attention is devoted to estimating. It might be a good idea for you to get in touch with this latter organization.

Defends Sound Wormy Chestnut

English Court Rules that Articles in which Sound Wormy Chestnut is Used are Prohibited from Entering British Market—Judgment Not Based on Facts

A British court recently handed down a judgment of $3,000 against a manufacturer of pianos on the ground that sound, wormy chestnut was used in the construction of the pianos in question. This, if allowed to stand, will result in a very serious situation, serious not only for the British manufacturer who uses chestnut as a base for his product, but for Canadian piano manufacturers and furniture men who cater to the British trade. The judgment is based on the ground that wood with the worm holes in it, or articles constructed of such wood, are liable to be infected with worms or larvae of injurious pests, and as such comes under a class of lumber, the import of which into Great Britain is prohibited.

J. M. Pritchard, secretary of the American Hardwood Manufacturers' Association, has taken exception to this ruling, and in an article in the association bulletin he shows that there is no foundation for the supposition that sound, wormy chestnut might contain infectious germs or larvae of any kind. The text of Mr. Pritchard's article is as follows:

Mr. Mayhew of the W. M. Ritter Lumber Co., has brought to our attention the fact that a British court has entered a judgment of $3,000.00 against a manufacturer of pianos on the grounds that wormy chestnut used as core wood in the manufacture of piano cases is liable to be infected with worms or injurious germs, which class of lumber is prohibited from importation to Great Britain, and the probabilities are the said piano manufacturer will be compelled to remove from England the piano cases in question, unless something may be done to bring about a repeal of this decision of the Brtish court.

Mr. Mayhew has secured several opinions as to whether or not wormy chestnut used as core stock contains any infectious germs and the unanimous opinion is that wormy chestnut does not contain any infectious germs or worms when used as core stock or base veneer, and that any worms or germs which might have been in the chestnut tree will be destroyed during the process of seasoning the lumber and the application of hot glue. All agree that wormy chestnut ranks as the very best hardwood for core stock and these opinions are upheld by Prof. T. E. Snyder, specialist in forest entomology, who is recognized by the Department of Agriculture as being an authorative expert in matters relating to insects affecting forest products.

The following are excerpts of Prof. Snyder's letters on this subject:

"Your letter of the 6th instant addressed to the Bureau of Entomology, has been referred to this office for attention. In reply, we beg to state that sound, wormy chestnut is much less liable to insect injury than ash, oak or hickory. In fact, we do not know of any authentic case where chestnut has been atacked by Lyctus powder post beetles after seasoning.

"The insects which infest living chestnut trees are different from Lyctus powder post beetles and are timber worms, namely a Lymexylon beetle technically known as Lymexylon sericeum Harris. You are perfectly right in stating that sound, wormy chestnut is not liable to be infected with worms.

"We take pleasure in enclosing our publication on Lyctus powder post beetles and their control. You will note that those insects work only in the seasoned sapwood of hardwoods and, as you know, chestnut does not have a very large amount of sapwood."

"Your letter of the 24th has been received and we take pleasure in giving you the following additional copies of our publication on powder post beetles.

"We believe that some wormy chestnut as a core or base for veneer is more suitable than any other hardwood which you could use, particularly as the sapwood of other hardwoods is infected by the very injurious insects described in the pamphlets sent you, whereas chestnut is never so attacked.

"As you know, sound, wormy chestnut is a trade name which has been in existence in the lumber markets for many years and applies to chestnut timber which contains holes made by timber worms while the tree is living in forest. These insects attack the living trees through knots or broken branches and make holes through the wood of the living trees. After the tree is cut and the wood dries out, these insects will not continue to work in the wood and, hence, the wood is graded as sound, wormy chestnut.

"We consider the utilization of sound, wormy chestnut a matter of conservation, since such wood can be used when covered by veneer, whereas it could not be utilized, on account of the worm holes for ordinary uses.

"You may be interested to learn that a very large percentage of all chestnut timber is affected by these worm holes—indeed, in some localities as high a percentage as 75, and there is no trade prejudice in the United States against the grade sound, wormy chestnut, since it is well realized cypress lumber is infected by disease.

"If there are any further details which we can give you, we shall be glad to do so.

"It seems to us that a strong point to emphasize in your appeal is that chestnut lumber is not infected by insects which are ordinarily destructive to other hardwood veneer and the core or base of hardwood veneer. This injury is fully discussed in the pamphlets sent you."

A small electric motor with a drill attached so it can be easily moved is a very useful tool in every kind of woodworking shop.

If you have only one band saw it will pay you to instal a band saw sharpening machine.

It is claimed for a sander that, having a travelling bed covered with rubber discs, it uses less paper than any other machine.

Some small articles seem as though it would pay to make them out of waste wood. However, experience has proved that they are made cheaper by using wood specially cut for the purpose.

It should always be borne in mind that a man who is a very indifferent workman with the bandsaw may become a first-class sawyer if he is put to work at some other machine.

A KILN is as GOOD as its PROCESS—
plus its EQUIPMENT—
plus the SERVICE of the MAKER—
plus the ORGANIZATION back of it all—

OUR PROCESS assures the control of the three fundamental factors—HEAT—HUMIDITY—CIRCULATION.

OUR EQUIPMENT is guaranteed complete, sturdy in construction, simple in its installation, economical to maintain.

OUR SERVICE is the broadest—engineers for layouts, building designs and operation—superintendents for erection and installation—experienced woodworkers for consultation and service during the life of your kiln.

OUR ORGANIZATION has been composed of woodworkers for thirty-five years, men who know wood and have handled it through the complete range of manufacturing operations.

NORMAN MACDONALD
62-64 Temperance Street TORONTO, ONT.

WHERE FINISH IS A MOST IMPORTANT FACTOR

Carborundum Brand Garnet Cabinet Paper

¶On beautiful cabinets, highly finished table tops—on any work that is to be hand sanded the workman simply can't go wrong if he uses Carborundum Brand Garnet Cabinet Paper.

¶In a Jamestown plant they use it for sanding varnished cabinet tops. Four tops to a single sheet is the average and the workman does seventy-five tops a day.

On sanding ornamental grills they find that Carborundum Brand Garnet lasts from 40 to 50% longer than any other paper they have ever used.

¶The workmen say that the Carborundum Brand Paper is remarkably uniform—that it gives a smooth, clean, "scratch-less" surface. Then, too, the backing is tough, yet flexible, never rolling or peeling under the hand.

Once again it is proved that Carborundum Brand Garnet Products Make Good Sanders Better Sanders

SKF

SKF Engineers Gather the Mechanical News of the World

They come to your plant with a knowledge gained not only in Canadian plants, but in American, British, Swedish, Swiss, French, Japanese and many other industrial plants.

If your mechanical problems have been solved before in any part of the world, SKF engineers can tell you how it was done.

It is their mission in life to help manufacturers get:

—increased production
—lower power and labor costs
—lower repair costs
—improved products.

Consult Canadian SKF Engineers about any problem in your plant. Their services cost you nothing.

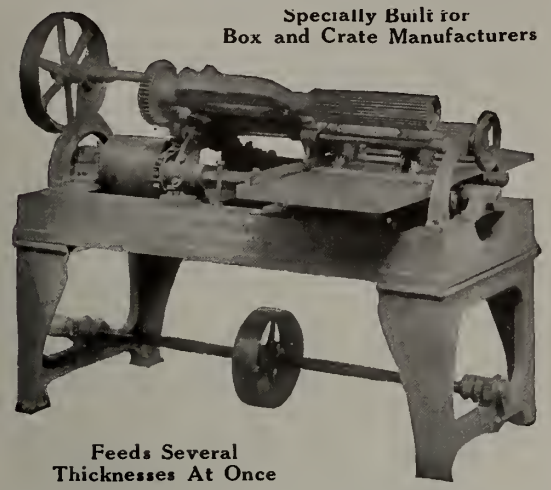
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

Chattanooga Machinery Company
Chattanooga, Tenn.

We Manufacture a complete line of

Chair, Cane-Cutting and Bending Machines

NAILING MACHINES

Are built strongly for heavy continuous service. Machines adapted to all kinds of special nailing.

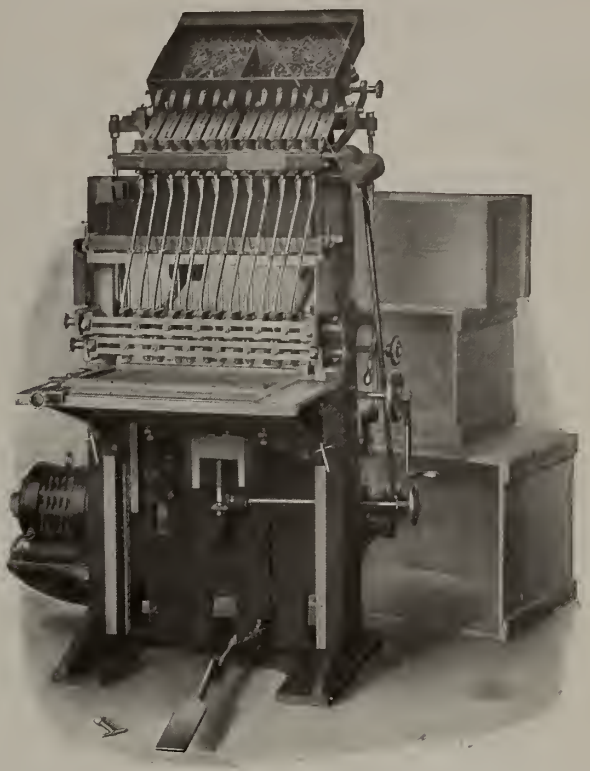
Regular machines for all sizes of boxes and crates.

Write us for descriptive literature.

Machines that save money

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.



Morgan No. 12-30 Open Back Nailing Machine, Fitted with motor.

THREE GUESSES

Is it economical

Is it the right type

Is it the right size

Electric power, heating, lighting and equipment problems are to be found in the woodworking industry.

Perhaps your output can be increased? You are, perhaps, losing electrical energy by wasteful types of motors? Are your switches and wiring devices up-to-date or are you in continual danger of fire?

We shall be pleased to answer any questions or help you with any problems whenever you care to write us.

Twice Monthly **Electrical News** $2.00 per year

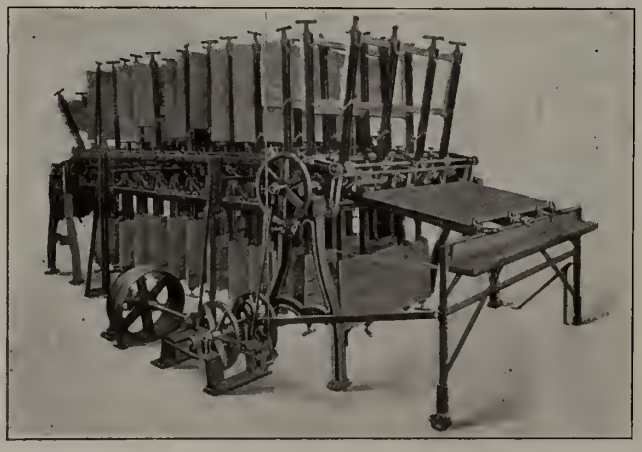
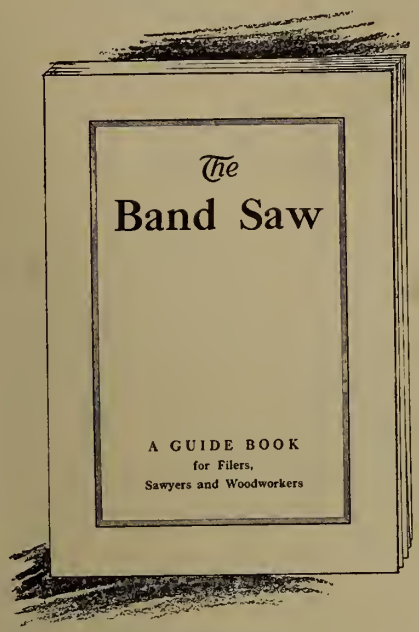
One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier



For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.



Ask For Your Copy

Into this book there has been put those general principles regarding the care of Band Saws, both Wide and Narrow, which we have found apply to the average mill or factory conditions. It is an invaluable instruction book for the apprentice learning to file saws. It is full of helpful suggestions for the expert who may want to know how others handle the various Band Saw problems.

For some time the makers of

Simonds Saws

have had this book in the course of preparation. It is now actually in type and the printer will have bound copies ready for distribution in a very few days. A copy of "The Band Saw" booklet will be mailed free to any interested millman who writes stating his name and address carefully and telling us his position or company connection. Address—Publicity Department, Simonds Canada Saw Co., Limited, Montreal, Que.

SIMONDS CANADA SAW CO., LTD.

Montreal, Que.

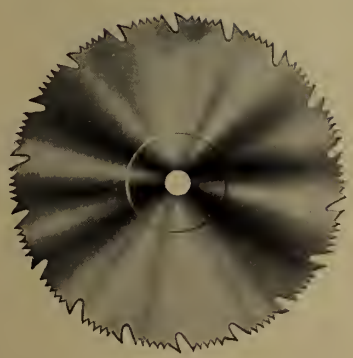
ATKINS

STERLING QUALITY

SAWS and KNIVES

mean continuous, efficient work and 100 per cent. production.

The extraordinary demand for more buildings and homes means that the Lumber output must increase.



Atkins Sterling Quality Saws and Knives will assist you in making the year 1921 the biggest and best in the history of your business.

Write to-day for our Knife Booklet "C W" and Pattern Template Paper.

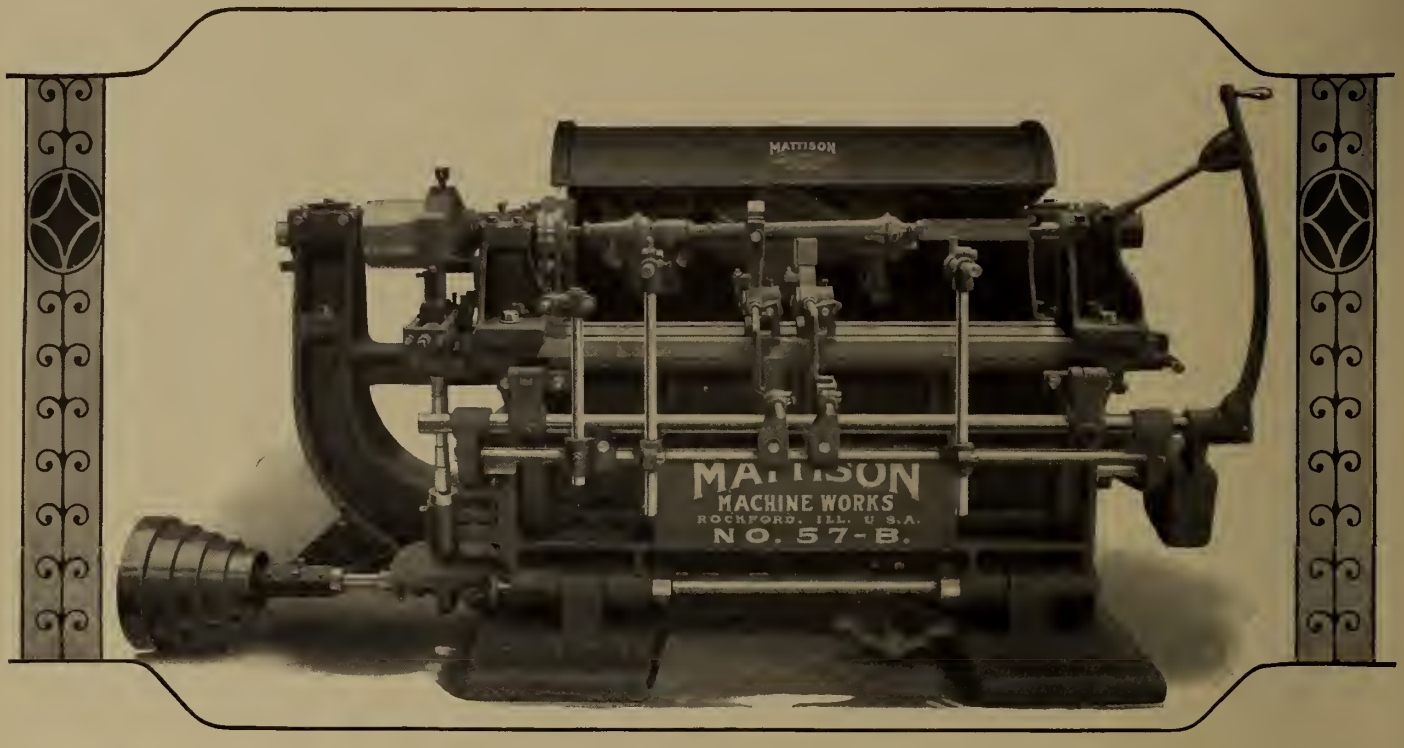
MATTISON
Automatic
The Standard Shaping Lathe
OVER 3000 IN USE



New Styles Demand More Turnings

The Mattison Automatic Shaping Lathe produces turnings much faster and cheaper than is possible with hand methods or with old style machine equipment. But of even greater importance is its flexibility which gives your designer free play in creating his designs. It faithfully reproduces all the historic round, square and octagon turned work, which plays so important a part in the new, distinctive patterns of today

If it is worth while to bring out new patterns, isn't it just as important to give equal consideration to the best and most economical method of producing those patterns?

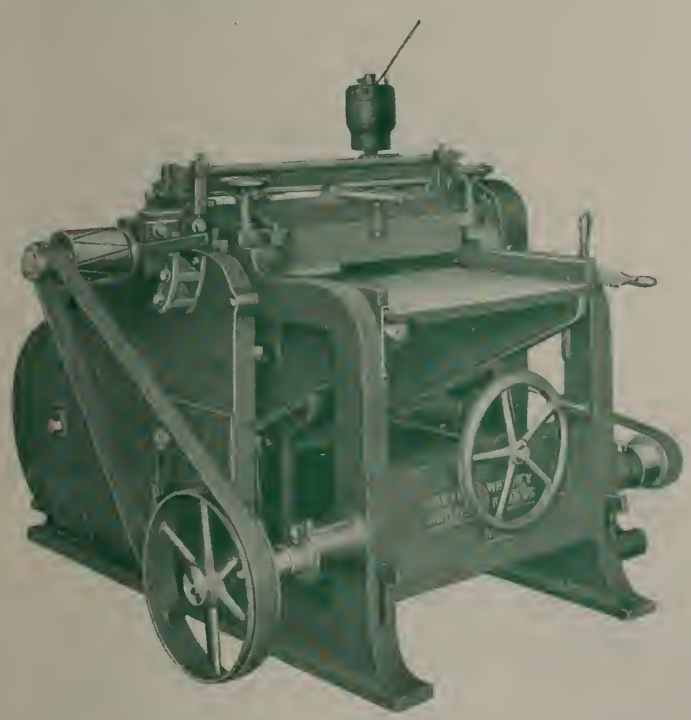
THE WHITNEY

No. 32 Single Planer

with Round Cutter Head and Electric Grinder

has special features that appeal to every woodworker, such as the



30" No. 32 Single Planer—Round Cutter Head and Motor Grinder

RIGID FRAME with ample weight of metal.

BED raised and lowerd on Solid Wedges operating on wide tracks.

HARDENED CENTRE TABLE made extra thick.

AUTOMATIC CHIPBREAKER working concentric with the cutter head.

SIDE CLAMP CUTTER HEAD BOXES easily detached.

CUTTER HEAD with long bearings of large diameter.

REMOVABLE BABBITTED FEED SHAFT BOXES.

SECTIONAL FEED ROLLS to handle narrow and uneven stock.

MACHINE CUT GEARS.

Whitney Planers are equipped with motors coupled direct to the cutter heads when desired

These machines can be furnished with two or four-knife Square Cutter Heads or four-knife Round Cutter Heads, Flexible or Sectional Chipbreaker and Motor-driven Grinders and Devices.

Write us for further information about this machine.

No Soldered Joints or Bolted Connections in

Canadian Crocker-Wheeler Rotors

The greatest improvement in modern induction motor design—no soldered joints to melt and cause arcing or open circuits and no bolted connections to work loose. The risk of fire as well as the possibility of motor troubles and consequent delay, is thus greatly reduced if not eliminated entirely.

The entire Rotor Winding of small squirrel-cage induction motors is cast of aluminum alloy—in one operation. Thus, the complete winding is one integral structure.

The medium and large size Rotors have liberal section copper bars and the end rings are cast-welded, making perfect contact.

The generous bearing sizes and sturdiness of mechanical construction throughout, further emphasizes the superiority of our motors for woodworking plants.

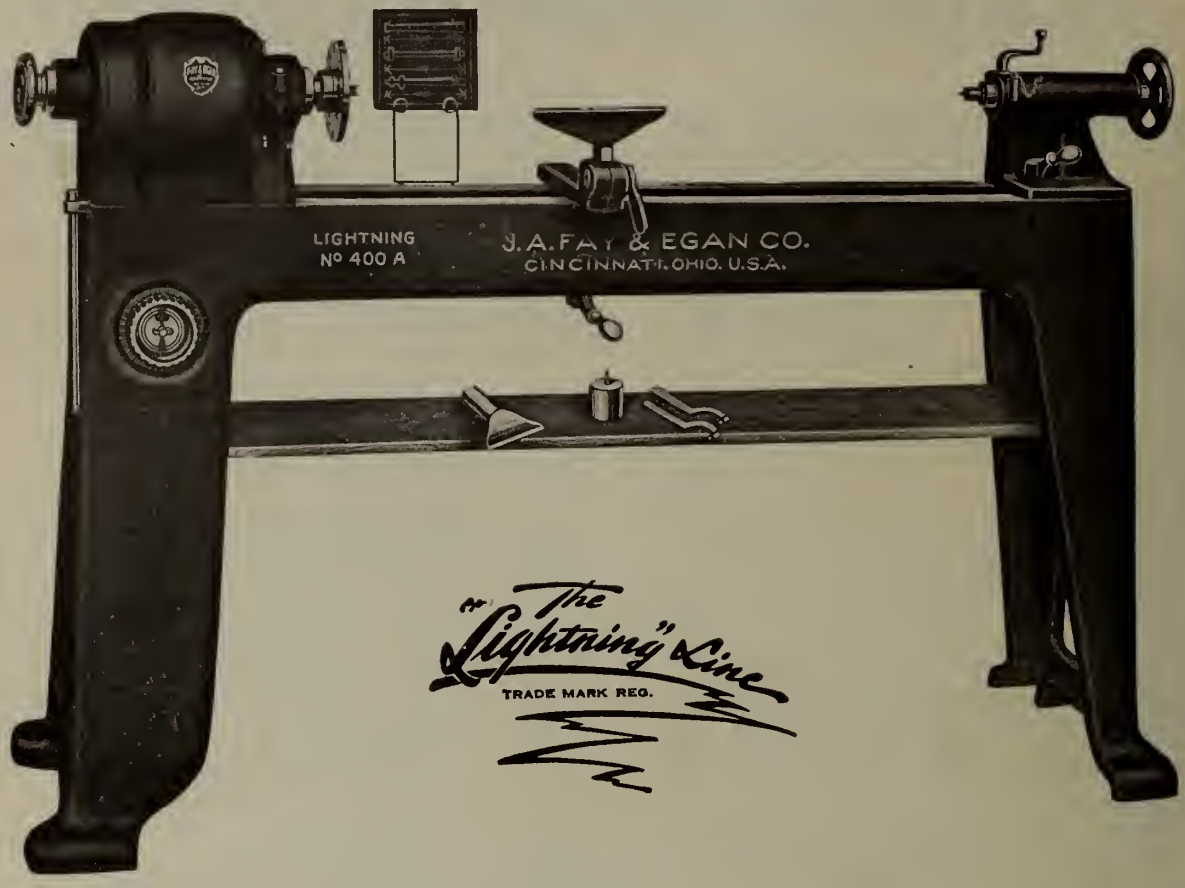
American No. 2½ Single End Tenoning Machine

For the Shop as Well as the School



No. 400 "Lightning" Manual Training Lathes

While these Lathes are used by a large majority of Manual Training Schools for a variety of work, they are also used by the large manufacturing companies, such as the Goodyear Rubber Co., Willys-Overland Co., Delco, Dayton-Wright Airplanes, and the Cramp Ship Building Co.

They are 300 to 500 pounds heavier than any other Manual Training Lathe.

Variable speed Motor Head Stock can be furnished for either direct or alternating current.

Control apparatus is built in and all operating mechanism entirely enclosed.

Write today for Bulletin U-14 describing these wonderful tools in detail.

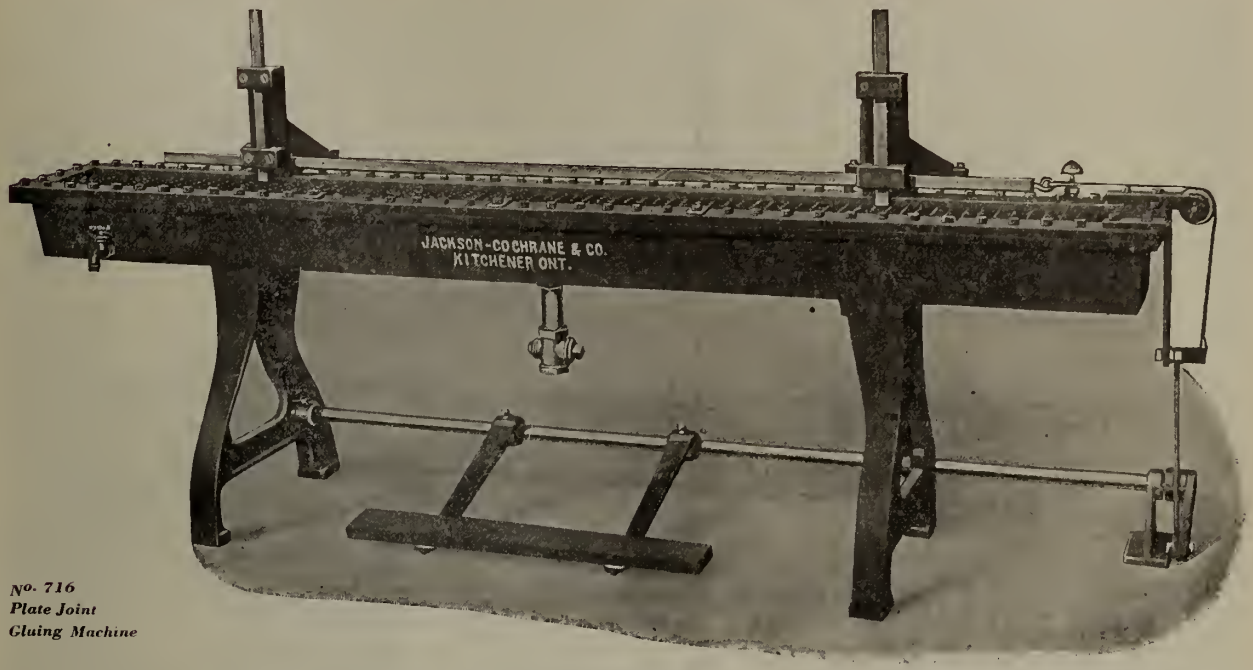
A NEW PLATE JOINT GLUE SPREADER



No. 716
Plate Joint
Gluing Machine

YOU CAN DOUBLE THE PRODUCTION OF YOUR GLUE CLAMPS WITH THIS NEW MACHINE

A thoroughly tested and tried machine that operates easily without waste or mess. It will more than double the production of your clamping equipment. This was proven when it was recently given a thorough trial in one of the largest furniture factories in the Dominion.

The method of operation is simple. The operator presses the foot lever down, forcing the perforated plate up out of the glue. Then by resting the edges of the stock on the plate and moving them backward or forward about one inch, the edges resting on the plate will be instantly and completely spread with glue. On releasing the foot lever the plate is lowered into the glue ready for the next batch of stock.

The tank is 5″ wide and 5″ deep.
Perforated plate is 4″ wide, ⅜″ thick and 1″ shorter than tank.

Size	Floor Space	Weight
5′ 11″	7′x2′	700
7′ 11″	9′x2′	800

Give the Best We Have AND Put the Best We've Got

INTO

Our Work:—Your Machines.

OUR REWARD—

Slowly but Surely we are getting the reputation about the country of being **a dependable firm,** supplying only **the very best** and **the most reliable** woodworking machinery and standing behind it "for better or for worse."

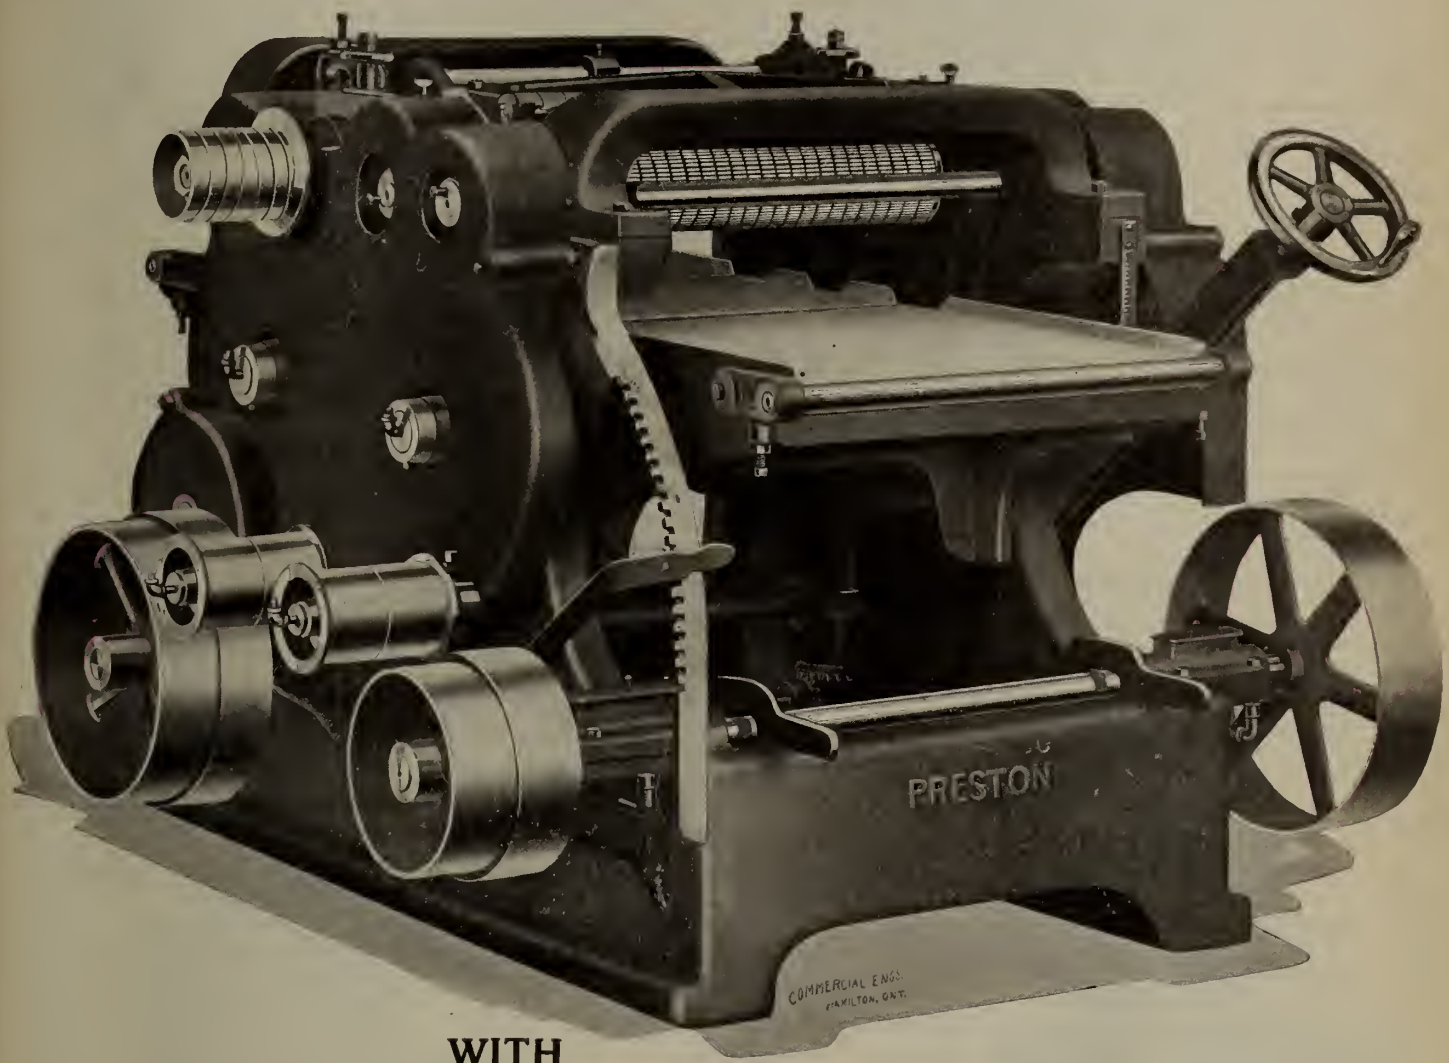
If you know any good about us, **tell your friends,** and if you don't know anything about us, **ask your friends,** but be sure to talk about us, and——give us a chance when next you need anything in our line **WELL DONE.**

The Preston Woodworking

PRESTON,

We are Sole Manufacturers and Agents in Canada of the Eaglesfield Patented Beltless Swing Saw.

Introducing a New High Speed Ball Bearing Surface Planer



WITH

(1) Specially selected S.K.F. Ball Bearings (2) Sectional Roll and Sectional Chipbreaker (3) Round Cylinder with 4 High Speed Knives (4) Stockbridge Knife Grinder and Jointer (5) Cylinder Speed, 5000 r.p.m.

The above is a cut of one of our No. 123-30" single surface Planers recently shipped a customer. We have supplied a number of them within the last two years, equipped exactly as above and would gladly show you the machines in operation in the different plants where sold. Speeded up, as this machine was, to 5000 R.P.M.(or to suit a customer's requirements) there is no question but what production and the quality of the work in any Plant will be greatly improved. It also raises the grade of your stock. Lumber run through our machine can be graded much higher than if run through a slower speed babbitt bearing machine. The machine can be used either as a roughing or a smoothing planer and will give 100% satisfaction.

MAPLE LEAF SAWS

Maple Leaf Saws will give you just that steady, day-in-day-out service that means so much in your plant. They are made with this object in view. The whole process of their manufacture, from the selection of the highest grade steel to the time they leave our hands is attended to with the greatest care.

The complete line includes Bands, all kinds of Special Saws for Special Work, Cross-cut Saws, Gang Saws, Dado Heads, etc. Every one guaranteed to merit your approval.

"ST. JOE"

Get the name fixed in your mind.

ST. JOSEPH IRON WORKS, St. Joseph, Michigan

Soak it Just a Few Seconds

— then rip off Whole Strip

That's all there is to an otherwise laborious job when you use

Troy Magic Plywood Tape

No sanding or scraping is necessary. It saves you labor, saves you time. saves you money, and does better work much easier than by the old fashioned process.

Troy Sealing Tapes

Made of special Troy Kraft paper, are gummed by our own process with Troy Magic Glue, adhere and set quick and "stay put" every time. A few seconds soaking and a little practice enables the workmen to remove the whole strip at one time, leaving a clean, smooth surface beneath.

We also make cloth Veneer Tapes. Write for sample coil of either or both and test them.

Efemco Casters—Desirable Equipment for Desirable Furniture

It is true economy, when spending hundreds of dollars in the manufacture of an excellent piece of furniture, to equip it with the highest grade casters—casters that will give service.

It is equally desirable to add such good casters on the sales floor or to old furniture.

Efemco Casters are made to grace fine furniture and to render perfect service throughout the life of the piece. That's what you want, although you may never have thought of it before.

Send to-day for the **Efemco** Catalog of better Casters.

Standaraized by 86 years of service.

On October 17, 1906 the S. S. "Corinth" sailed from Axim, Gold Coast, Africa, to Pensacola, Florida, with the first full cargo of mahogany logs ever shipped from the continent of Africa.

Prior to 1860 complete cargos had sailed from Africa, but the holds were laden with human freights from which was manufactured the great American Civil war.

From the valuable cargo aboard the "Corinth" was produced the beautiful and the useful—a contribution to the prosperity and civilization of America.

To the successful venture of this pioneer ship is largely due the position and influence of African Mahogany in the wood artistry of today.

It is immaterial that the Mengel Company were the operators of this ship and the owners of this cargo.

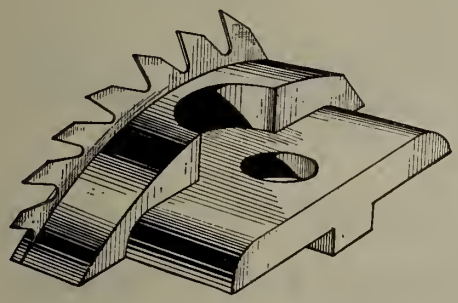
THE STANDARD Dry Kiln

1542 McCarty St. INDIANAPOLIS

The Shuff Sticker Saw Head Attachment



Canadian Patent No 212337

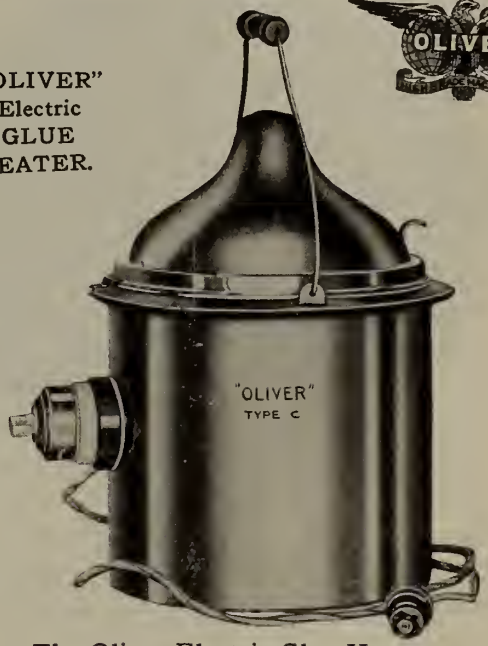
This attachment will double your moulder production, widening its range of performance and effecting a real saving in the running of pully stiles, blind stops, cove, parting stops, window stops, fillet, glass bead, base moulding, ceiling, lattice moulding, screen moulding, base shoe, quarter round, stools, panel moulding, etc. Used for splitting moulding when two or more are run at the same time, a decided improvement over the flat knives for this purpose ; also used or rabbeting and grooving.

The attachments are furnished in pairs of rights and lefts, are made of solid brass, each pair properly balanced and saws sharpened and set before shipment. Made in all sizes to fit any moulder. When ordering send sketch of end view of sticker head. Cut smooth and are easily set up. Price $30, 00 in American funds f.o.b. Waukesha, Wis.

Manufactured by

JOHN SHUFF P.O. Box 45, 145 Barstow St. Waukesha, Wis.

"OLIVER" Electric GLUE HEATER.



The Oliver Electric Glue Heater

is built on the "fireless" cooker principle. No water-bath.

Two cents worth of current runs the "Oliver" 1 qt. heater all day.

Construction entirely of heavy spun copper.

Portable. Fits any lamp socket. Soon saves its cost in time, glue saved, and more economical current consumption.

OLIVER MACHINERY CO.
Grand Rapids, Mich., U. S. A.

Automatic Hole-Cutting Machines

The Wheel and Hole Cutting Machine has four automatic movements, all of which work in perfect unison, performing their functions in clock-like regularity.

The Hand-Hole Machine will cut hand holes in crate and box ends. It is worked by a carriage and levers, and will cut any size or length hole with either round or bevel edge in any kind of wood.

Emerson Says—

"If a man can write a better book, preach a better sermon, or make a better mouse trap than his neighbor, though he build his house in the woods, the world will make a beaten path to his door."

Altho' we have only been in business for the past eighteen months we can see unmistakable signs of the beaten path already.

"What Others Say"

"Your letter of February 15th received and we want to say that this was a very nice lot of lumber. It was good widths and lengths and well manufactured, dry stock and the grading was very liberal. We are sorry we cannot use more of this lumber at the present time. ***We received several cars from other manufacturers at a cheaper price but the lumber was not nearly as satisfactory.*** When we are in need of more stock we will take the matter up with you."

(Note—The above was sent us February 24, 1921 unsolicited. Name given on application).

MAHOGANY

Rarely are such stores of precious wood to be found as may be seen in our yards. Across the seas from tropic lands it comes. From thick jungles where the light of day but dimly penetrates and where tangled native paths make difficult the bringing out of timber. Here the black man labors, risking life from jungle dangers, that supplies will not diminish and your orders may be filled.

Twelve million feet per year is the capacity of OTIS mills. An adequate supply is always on hand for prompt shipment. Get our prices.

Quality *from the source*

HARDWOODS of the same kind differ greatly in quality in different localities. The St. Francis River Delta is noted the world over for the perfection of its trees and it is in the heart of this district that Chapman-Dewey hardwoods are cut Our three modern sawmills operate in our own 50,000 acre tract, milling only logs adaptable for specific purposes.

The recent sudden revival of hardwood lumber buying is fast depleting available stocks everywhere. The situation is rendered more serious from the fact that, among all mills, only about 10 per cent of the normal amount of logs have been put out this fall. This condition will undoubtedly result in a hardwood shortage by spring, with greatly increased prices as a natural consequence. The facts indicate that now is a good time to stock up on hardwoods.

Wire our expense for price quotations.

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

AMERICAN WALNUT

"The Cabinet-wood of the Ages."

WE ARE TELLING THE PUBLIC: "BE SURE YOUR WALNUT IS REAL WALNUT."

THEY LIKE WALNUT

It is largely due to our persistent and steadily increasing national campaign of advertising, as well as to the superior merits of the wood itself, that the almost universal preference is for American Walnut for furniture, paneling, trim, etc., in good buildings of all types.

This is "The American Walnut Period"—and it will be a long one—a market fact of which progressive manufacturers of fine furniture are keen to take all proper advantage.

Write for a copy of the Walnut book, which is carrying the message of Walnut to the home, architect, furniture trade and woodworker. Sent free.

This yard was BUILT or perfect drying. The appearance of the piles will convince every man who knows hardwood lumber.

Lumber Can't Be ALWAYS Good Without Perfect Piling

The *correct* drying of hardwood lumber is a science based on definite formulae. Recognizing this, our yard was *built* to insure the most perfect possible drying.

Everyone familiar with lumber will recognize what the appearance of the piles in the accompanying photograph means. They are your guarantee of flat, straight, clean lumber.

Our list includes the standard species and grades of southern hardwoods with NOTHING PICKED OUT, and has behind it a comprehensive and conscientious desire to give the customer his full measure of value and service,

Vol. 21 Toronto, December, 1921 No. 12

What of the New Year?

St. Paul, the apostle, once said:—"Forgetting the things that are past, I press toward the goal." That advice is good to-day as far as oneness of purpose is concerned, but the past, especially the last two years, has some lessons which should not be lost. Two years ago we were enjoying a boom such as has been seldom experienced. The public had gone buying-mad. Furniture, wood products, in fact most commodities, were in strong demand. Prices rose overnight and factories were taxed to capacity. Except for a few far-sighted individuals, the general impression seemed to be that the good times would last indefinitely. Prices reached such high levels that the public refused to buy and the inevitable reaction followed.

Eighteen months ago lumber values, aided by a combination of circumstances, together with a short-sighted policy on the part of lumber users, soared to undreamed-of heights. Production was increased. Suddenly wood users found that they could not sell their product at prices based on current lumber values. The demand fell off, cancellations quickly followed and the descent was as spectacular and precipitous as the rise had been.

Two months ago the lumber market touched the other extreme. There was little or no demand. Values had declined until they were at or even below manufacturing costs. Production was reduced until it was estimated to be but a small percentage of normal. Many stocks were cut and slashed in an effort to meet pressing liabilities. With production at such a low point, it was to be expected that stocks would become broken and that certain items would be practically off the lists. When this was realized, many manufacturers entered the market and prices stiffened. Is the lesson of the last eighteen months to be lost, will wood users refrain from buying until the last possible moment and then come in with a rush, or will they profit by the past and buy now in a careful, conservative manner?

The furniture industry dropped from peak production to about 40 per cent of normal. The demand for this line has slowly but surely improved. To-day the factories are operating at about 70 per cent of normal capacity. The retail furniture trade has held up remarkably well. Stocks on the floors of the different stores are reported to be low. The January furniture exhibitions, which are being held in Toronto, Kitchener and Stratford, are expected to result in a satisfactory volume of orders. Furniture prices are at rock bottom, though this fact is not accepted by the dealers in general, and any price movement will, probably, be upward. It is not anticipated that many lines will show any great change. The publicity work of the Home Furnishings Bureau should add to the volume of business to be done. Taking it all in all, the furniture manufacturers have every reason to look to 1922 with optimism and renewed hope. The same applies to the piano and phonograph industries.

In the general woodworking field, business is remarkably good. The open fall has resulted in building activities, particularly residential work, being carried on at almost summer pace. With building costs well down from the high levels of last year, reductions having taken place in practically all items entering into the construction of a home, coupled with the pent-up demand for houses, it is probable that the opening of spring will witness a resumption of building on a satisfactory scale.

The woodworking industry is in an enviable position and may well view the advent of 1922 with optimism. A large proportion of wood products enter either into the construction of homes and other buildings or their furnishing. With a strong pent-up demand for buildings of all kinds—a demand which cannot be put off for an indefinite period and which will, in all probability, be met, in part, at least, during the coming year—it would seem as if the future holds good things in store for those engaged in this industry.

Prices must be kept as low as possible. Any tendency to force values up will only result in slowing up demand. One way to stimulate sales is through lower prices made possible by decreased production costs. This can be brought about by the elimination of waste both of material and labor and the use of modern production equipment. The February "Canadian Woodworker and Furniture Manufacturer" will be a special "Modern Methods Furniture Number," dealing with the newer developments in equipment and the furniture manufacturing methods. The ideas which are to be included in this issue will assist woodworkers in keeping their costs within reasonable limits.

Internal or External Competition—Which?

Shall Furniture Manufacturers Compete With Themselves or With Other Industries—Passive Attitude Does not Tend for Progress—What Furniture Makers can do to Increase Volume of Business

By L. R. WRIGHT

With the drawing to a close of the Fall publicity campaign of the Home Furnishings Bureau, it is only natural that one's thoughts should turn to the future, particularly to 1922. What should be done to boost the sales of furniture during the coming year? Is it enough that the furniture manufacturers put forth greater sales effort, and thus increase competition among themselves, for whatever volume of business next year may happen to provide? If it is possible to enlarge the market for furniture, to create a greater volume of business, would it not be the part of wisdom for all furniture makers to work together and centre their energies in this direction rather than vie with each other for a lion's share of what ordinarily would offer.

Several furniture manufacturers have intimated to the "Canadian Woodworker and Furniture Manufacturer" that at the present time their efforts are centered on making sales rather than on manufacturing and that they are more interested in how to bring in more orders than in how their manufacturing operations may be improved. This seems to be a one-sided view of the merchandising question for one logical way to increase sales is so to improve and organize the production of furniture that costs are reduced and prices lowered. Be that as it may, the goal of increased sales can be reached by participation in a broad far-reaching co-operative scheme having as its object the raising of the standard of Canadian homes.

Real Appeal of Furniture

Someone might ask, why should the furniture manufacturer give time, thought and money in an effort to arouse greater interest in furniture when the retailer is the one who will derive the greatest benefit from such a move? The real appeal of furniture is not its utility, for a person could eat as well from a plain kitchen table as from the most stylish period dining table, but it is a combination of beauty, proportion, comfort and convenience. A better furnished home is the ideal toward which every buyer of furniture is striving either consciously or unconsciously. The trouble in the past, and even today, is that the majority of those who buy a piece of furniture do not recognize this as the goal toward which they are working. The same may be said of the retail furniture dealer. When a retailer makes a sale he is selling a better-furnished home, but like his customer, does not realize this fact and as a result has not grasped its full significance. It remains for the maker of furniture, that far-sighted, practical individual, who has a breadth of vision which enables him to see beyond the confines of his factory, beyond the mere selling of his product, into the homes of the citizens of Canada and which has forced upon him the realization that upon him devolves the duty of raising the standard of Canadian life and Canadian homes to attempt a general educational movement upon a comprehensive scale. His reward will be the satisfaction to be derived from the rendering of a service which tends to elevate and improve Canadian homes and Canadian home life and from an enlarged and extended market for his ware.

How Idea Could Be Developed

It might be of interest to outline briefly a few of the features which could be included in the program for the coming year, taking it for granted, of course, that the activities of the Home Furnishings Bureau are to be continued and even extended. The backbone of any general educational publicity campaign is the advertising which is carried in the magazines and newspapers. The ideal scheme would include a continuous drive from January 1st, 1922, to the end of the year and then on indefinitely. However, this will have to be modified in accordance with the funds at the disposal of the Bureau. In any event a spring and fall advertising campaign should be ensured, the former to be conducted during March, April and May, the latter to run during October, November and December.

Apart from this phase of the work there are numerous other channels in which the Bureau should function. Every week, in fact every day should witness some definite activity in favor of better furnished homes. Special "Better Furnished Homes Weeks" could be organized in various centres. Educational work might be undertaken in schools and with teachers, among retail furniture dealers and their sales forces. The representatives of the furniture manufacturers could also be assisted and instructed. Educational articles on furniture, furnishings, color schemes and decorative effects should be secured and given to the newspapers and magazines for publication. Illustrated lectures could be prepared or secured and made available for women's clubs and various societies and organizations which would be glad to take advantage of such material. An attractive booklet should be prepared for free distribution to those interested, showing desirable interiors, color schemes and containing information and suggestions which would be of assistance to those who are striving to make their homes more attractive.

Improvement of Home Sole Objective

The whole scheme should be developed primarily with the sole purpose of improving the standard of Canadian homes instead of attempting to push the sales of furniture. The result will be the same in either case—more furniture will be sold—but it will have been accomplished in a dignified manner as befits the great furniture industry. A discussion of homes invariably leads to a discussion of furniture. Better furnished homes means better furniture. The two are inseparable. As the desire is created for a comfortable, tasteful, better-furnished home, a new market has been made for the output of Canadian furniture plants.

There is a common belief to the effect that a person, manufacturing organization or even an industry either goes forward or slides backward. There is

no middle course, no standing still. What is the furniture industry going to do during 1922? Is it going to go forward or is it going to slip backward? Is it going to forget the vision it has had during the last few years, overlook the favorable impression which has been made by its publicity efforts, ignore the fact that furniture sales can be increased, perhaps doubled, by intelligent, aggressive effort, and rest on its oars, or is it as a unit, supported by every individual manufacturer, going to inaugurate and support a far-reaching campaign which will assist in raising the furniture manufacturing industry to where it belongs and make Canada a country of better-furnished homes? The answer rests with each manufacturer as an individual. The Home Furnishings Bureau is helpless without your support and co-operation. It is yours to withold it or give it. In the November "Canadian Woodworker and Furniture Manufacturer" the question,—"Is 1922 to be a furniture year?" was asked. What is your answer?

What are the Small Leaks Costing You?

Little Losses Which Pass Unnoticed Take High Toll—Lumber Wastage Reduced Through Closer Attention to Detail—Every Phase of Work Should be Studied

By WM. SNAITH, C. E., Associate Engineer with Forest Products Engineering Co., Chicago.

We've all laughed at the man who didn't fix up his leaky roof because he couldn't do it when it rained and didn't need to do it when it was fine. He must have lived a long time ago and left numerous decendants who have become manufacturers. They are too busy in good times to make improvements and in bad times they don't need them. The time to stop leaks is all the time. When business is good the proverbial rainy day should not be forgotten and when business is bad it is sometimes possible by stopping the leaks to make profits as large as in boom times, Prosperity breeds bad habits and waste. Hard times teach thrift.

The waste of labor and material in many plants if it could be reduced by half, would likely be sufficient to cover all the overhead. Andrew Carnegie succeeded in the steel business because he was a champion "scrapper" in two senses, but the most important of the two was that he never hesitated to scrap a machine if a better was invented. There are woodworking plants where enough labor is wasted trying to make out-of-date equipment work, to cover the cost of new equipment inside of a year. Some plants with new machinery operate at a fraction of its capacity.

Not Conspicuous

The trouble with such leaks is that they are not easily seen. If material worth a few hundred dollars is spoiled it occupies space and is very much in evidence. If a foreman has to spend half a day trying to make some old relic of a machine turn out work, his time is wasted and through lack of his supervision the labor of his department is to some extent misapplied. Or if he is called upon to spend much of his time at reports and clerical work, the duties he should be attending to must inevitably suffer and result in loss of labor. When methods are not standardized and a workman has to learn where to find fixtures and tools, where to go for this, that and the other thing, the manufacturer pays for this training and losses all it cost him when the man quits and a large part of it if the man is promoted or moved to another job. Leaks of this kind can go on for years and be looked on as inevitable—necessary evils. most of them can be avoided by right methods.

The loss of lumber through wrong methods of drying would run into an impressive total if it could be measured. There are kilns in use in many plants which violate nearly every scientific principle of drying; there are others which produce more or less satisfactory results at times and ruin the lumber at others. It is one thing to dry lumber which has air-dried for months and another to dry green stock. A kiln may be able to do the one and fail entirely to do the other. The operator may lack knowledge of the principles involved and still produce suprisingly good results within narrow limits by rule-of-thumb methods. Outside of these limits the results may be equally surprising as also the resultant losses. Even with modern kilns inexpert operation can injure the lumber. Much has been written on this subject but apparently most of it fails to reach the practical men who are entrusted with the most important single operation in woodworking. A man handling a fair-sized battery of kilns of modern type could easily earn a salary of several thousand dollars a year in the fuel he could save and the lumber he could prevent being spoiled or damaged. It is an error of considerable magnitude to entrust this work to anyone but a man of skill and experience, preferably with technical training in kiln work.

Handling and Piling Losses

Even before the lumber reaches the kiln losses are sustained by improper piling in the yard. The piling of lumber, size and spacing of stickers, pile foundations and the such like are nowadays beginning to get a little of the attention they deserve. When the information on these matters in the technical journals reaches the practical men in the lumber yard and they begin to take it seriously a large sized leak will start to close up.

Inside the plant there are few operations which cannot be improved. Waste motions abound. The bandsawyers marker goes on counting pieces before nailing them together, ignoring the fact that the nails automatically count the pieces. The placing of trucks with relation to machines can affect producton to the tune of 10% and make all the difference in the world to the operator in the matter of fatigue. There are operators who have worn tracks into hardwood floors with steps which need never have been taken.

Systematize Inside Work

In trucking and handling quite respectable sums can be saved in the course of a year. Well built trucks of the proper size and capacity are dividend payers. Rehandling from trucks to piles or bins and back again to truck is indulged in sometimes to such an extent that the cost would be impressive if it could be separated from the item "factory expense" into which it is lumped along with numerous other necessary evils.

The time spent on making out and punching time-cards runs away with a fair sized share of the time

between starting and quitting. If all the records so made out were perfectly reliable they might be worth what they cost. But when they show time taken actually half what the best man in the plant could do the job in, and another time three times, his confidence in their accuracy is somewhat shaken. At their best, cost records only show past performance. Whether this represents a fair day's work or not the records can not indicate. The pace being steady or the performance consistent can not be taken as indicating that the limit is even nearly reached.

The advent of the engineer into the woodworking field is revealing many of the leaks and as rapidly finding ways of stoppng them. The egineer is no respecter of old age in methods, machines or practice. He is an ultra-modernist when ways of doing things are concerned. So much more can be accomplished with carefully directed energy than by the hit-or-miss method, that it pays to bring trained minds to the study of even simple operations. The engineer is not a salesman pushing some particular kiln or machine and can give unbiased advice about all of them. In many cases improved methods of using existing equipment prevent the necessity of purchasing new. In other relatively new equipment may be profitably scrapped for still newer.

The discussion of leaks and ways of closing them would be incomplete if the human factor were left out. The workmen are the agencies by which in the last analysis all the stopping is to be accomplished. The workers must be provided with an incentive to make it worth while for them to increase production or improve quality. The foreman must find that increased efficiency in his department results in increased pay. Both these matters have been treated in a previous article.

Leaks of different sizes exist in all plants. Some are known and recognized for what they are and some are hidden. They cannot all be stopped at once and while some holes are being plugged others grow larger. The more attention the leaks get the more profits there are in the business.

January Furniture Exhibitions

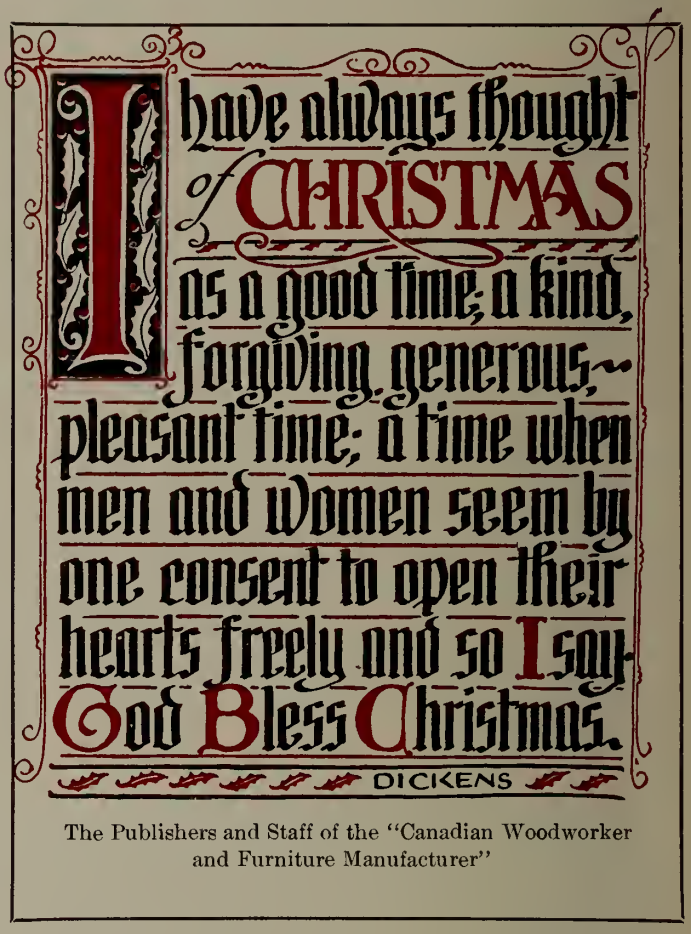
The furniture manufacturers of Ontario are busily engaged at the present time in bringing out new samples and in making plans for the furniture exhibitions which are to be held January 9-21. As heretofore, these displays will be made at Toronto, Kitchener and Stratford.

The Toronto exhibition is to be held in the new live stock arena building at the Canadian National Exhibition. Here 125,000 square feet of floor space are at the disposal of the furniture manufacturers. Owing to the delay in securing these premises a number of the furniture makers who have been in the habit of displaying at Toronto have made plans to go to one of the other centres. Their places are being taken by other representative furniture men, so that the show at Toronto will be up to the usual standard.

The Stratford manufacturers are making their displays in their home town, as usual. In addition, several outside manufacturers have decided to show in Stratford. It is anticipated that the furniture exhibitions in this centre will be on a more pretentious scale than on former occasions.

Not to be outdone, the Kitchener-Waterloo furniture men, aided by a number of outside manufacturers, are striving to make Kitchener the centre of attraction during the market period. Not only have arrangements been made for a large number of attractive displays, but preparations on an extensive scale have been perfected for the convenience and entertainment of visiting furniture buyers. As one Kitchener manufacturer has put it, "there will be something doing all the time."

It is expected that the retail men will attend these exhibitions in force. Business in the retail end of the industry has been good and at the present time stocks on the floors of the various dealers are well below normal. It is, therefore, confidently expected that a gratifying volume of business will be booked, sufficient to keep the furniture industry going for the winter months, at least. Many new and attractive designs will be shown and while prices have been figured down to the last notch, it is anticipated that the price tendency will be higher. This is accounted for by the fact that such woods as gum, walnut and oak have advanced during the last two months and that there has been a big advance in glass with another one expected early in the year. This latter fact will have a marked effect on the cost of goods into which glass enters. There may be a re-adjustment downwards on certain items, but on the whole the tendency will be upward. This in itself should have a stimulating effect on business for it should tend to convince the furniture dealers that prices have touched bottom and are on the rebound.



The Publishers and Staff of the "Canadian Woodworker and Furniture Manufacturer"

A wood pulley is a balanced pulley, which is a big consideration when the countershaft runs 1,000 revolutions per minute.

The Wisdom of the Wisemen

A Wood Turner's Christmas Carol

By WILLIAM BABBITT

MOTHER met me at the door last night, when I came home from the shop. A happy light was in her eyes, and on her cheeks the soft flush of joy. The news tumbled from her lips,—"Father, the boys are coming home for Christmas."..And suddenly there was with her a multitude of happy memories, as of an Heavenly Host, praising God. Like one of the spell-bound shepherds of the Judean Hills, I stood silent, wondering what these things might be. It was in such wise that a tired, dusty wood turner, worried and heavy laden, heard once more the far echoes of the Angels' song, and caught yet another gleam of "the light that never was on sea or land."

Under the evening lamp (the spell still upon me) I read again that story which ends with the visit of the Wisemen from the East. Somehow, I found myself strangely kin with these hardy adventurers after Truth,—who so superbly ventured, so greatly served, and so quickly and completely were lost in the World's heroic host of the unnamed and unknown. Here is a thumb-nail sketch of their story.

Their Journey:

Led by a Star, Wisemen came out of the mystic East to find the Babe of Bethlehem. Long, weary leagues they safely followed the Star.

Their Tragic Folly:

When they came near Jerusalem, they forsook the Star that had guided them, and asked the wise-acres of Jerusalem what to do and where to go. From their questions, Bloody Herod learned Whom they were seeking. The result was the slaughter of the innocents",—the murder of all the baby boys of Bethlehem.

Their Wisdom:

Quickly they returned to the guidance of the Star, which soon "stood over where the young Child lay." After doing homage to the young Child, "they opened up their treasures." Then they made haste and were gone.

Now do you wonder that I fell to asking myself whether or not these Wisemen were entitled to the name? Does not their folly bulk larger than their wisdom? If they were wise, why did they not stick to their proven Star for guidance? Why did they adventure into circumstances they did not understand, to make mistakes the effect of which they could not foresee? The echoes of the "Angels' song died away. Once more I was grappling with the hard realities of a hard day's work. Then came the clue to the mystery. The wisdom of the Wisemen is to be tested not by its quantity, but by its quality. Being human, they erred They did not have enough of any kind of wisdom to prevent blunders. But being "wise," they were where high service called them at the time they were needed. They had that quality of Wisdom by which all progress is won.

What Wisemen they were! They were men of vision. They dreamed dreams. They had faith. To them, the bloody reek of terror and darkness round about was not hopeless, but prophetic of better days and better men.

They were men of courage. Their lives were not ruled by the counsels of fear. They dared to put their vision to the test. The dangers and hardships of the long journey failed to daunt them. Forth they went into the Unknown, each alone; but each to find kindred souls who saw the same vision and dared the same quest.

They were men of purpose. They did not undertake danger for the love of the thrill and excitement of meeting great hazards. Nor did they shrink from danger. It was an incidental matter, of interest only as affecting their quest.

When the Wisemen came to their journey's end, they found their quest, Him "that was born King of the Jews," in circumstances so squalid and unseemly as to upset every reasonable anticipation. But they did not hesitate. Swiftly and competently they worked to their purpose. They rightly estimated the grim purpose back of Herod's courtesies, though they little guessed to what murderous limits his jealousy would go. "They opened up their treasures." In simple words, they provided money for the safe flight of the Mother and Child. They backed their judgment with their money. This is sound business for our day as well as theirs.

What a sound method of judgment and action the story reveals. It is not the method of timid "3 per cent and safety" conservatism. Still less is it the method of blue-sky investors. These are steps in their method: Vision, Courage, Investigation, Decision, Preparation, Action. There will be a percentage of failure. But any man who insists that before "action" shall go the five great pioneers of wisdom, will find eventually that his energies, his resources and his desires are bound up in the great enterprises of humanity, whose ultimate boon is "Peace on Earth to men of Good Will."

We must admit that there is another kind of wisdom, the gray-bearded wisdom of the past. This wisdom needs no vision, because the sum of all wisdom is in the sayings of the dead. It chooses the old paths. It needs no courage, because it has no adventures into the Unknown. This wisdom looks for light where the sun has gone down. It is the ancestral wisdom of China and India. But it is not the wisdom of wisemen,—of the star-led. It is not the wisdom of PROGRESS, greatly conceived and greatly attempted.

Our task to-day is to reconstruct the fabric and constitution of industry to meet the demands of the New Era. Many there be who will attempt this mighty task by the light of the sun that has gone down. They will say we must seek the old paths, the old levels of business, the old systems that worked so well in an age that is dead. But we know full well that the precedents of yester-year will not avail for this new adventure. Of small value is the wisdom of Solomon for our enterprise. Our vast and solemn undertaking shall be accomplished only by a Wisdom whose Vision pierces the Unknown, whose Courage dares to test that Vision's truth, and whose Will is steadfast 'till the quest is found. Our need is the Wisdom of the Wisemen.

Thus it happens that as a humble wood turner

takes up his woodland harp to strike the dominant chords of the Carol of the Wisemen, he hears not only the great major chords of struggle and victory and peace, but also the throbbing minor of pain and loss; "Rachel weeping for her children because they are not." Not from the shelter of the tombs, but from the vast unknown, the voice of Wisdom cries. The quest is not some long lost Age of Gold, but this Age of Ours, foretold by all the hopes and longings of the sons of men.

It is not told of the Wisemen by what path they came, or at what cost; or whither they went. It is told however that as they journeyed folly stalked at their heels. But despite of all, and Rachel's tears, they won their quest. It is not told by what path we must go, or at what cost. But so it must be, methinks, with all who follow the star-blazed trail.

Spiritual Values in Industry

Character and Moral Fibre More Important Than Factory Equipment and Raw Material—Industrial Problems Cannot be Settled by Force or by Legislation

By ROGER W. BABSON

The old method of teaching economics was that everything comes from "land and labor." Many courses are now being taught in our colleges to-day along those lines. Statistics, however, clearly show that this is a fallacy. For instance, China has greater natural resources and more available labor than this country and yet it is away behind this country. Natural resources, available labor and capital are important, but these things are of little value until they are released by people filled with the spirit of God. That is what the study of economic history clearly teaches.

It is very important for everybody to see that their sons and daughters realize that the old system of economics is false because it omits the most important factor of all, namely, the spiritual values. As Towson says, "Materials, labor, plants, markets, all these things can be adjusted, but the soul of man, which determines his purposes and his motives, can only be converted through religion."

Printing was discovered in China several thousand years ago, but it began to be developed only three or four centuries ago in Europe for the spreading of the teachings of the Bible. It was the desire to propagate the teachings of Jesus which developed printing. Religion has been the spiritual force which has developed not only our nation politically, but commercially and industrially as well. Economic history teaches one thing very plainly: the industrial problem will never be solved by employers' associations, or labor associations, or consumers' associations, but only as all get together as brothers filled with the spirit of God. If I learned one thing during the two years when serving Secretary of Labor Wilson, in Washington, it was that these problems can never be settled by force or by legislation.

Our troubles to-day are very largely due to the fact that we have been trying to run industry by the will of Congress instead of the will of God. The trouble with bankers to-day is that they are looking too much to Dun's ratings and Bradstreet's ratings and too little to God's ratings of men. Some one asked me recently the difference between ethics and religion. I replied, "Ethics is the track of the railroad system; religion is the motive power. Ethics is the wheels of the watch; religion is the spring of the watch."

When industry started in this country, we built a foundation for a two-story building. We have been adding additional stories to this building until we have an eight or ten-story building with the same spiritual foundation. The great task before industry to-day is to quit adding more stories to the structure and to strengthen the spiritual foundation underlying that structure, without which there can be no structure at all. This is not mere theory; it is very evident in all lines of work. Take any industry for instance. What is the most important asset—the physical property or the management? Any banker will tell you that it is the management. What is the most important asset to a corrporation from a business point of view—a great mass of buildings, or a God-fearing board of directors? The answer is obvious.

I am speaking as a statistician, not as a preacher. Our political freedom, our personal safety, our educational system, our work to relieve suffering, our industry and commerce—everything that is worth while to civilization—we owe to those spiritual qualities which teach man to serve.

The Indian did not care to construct a log canoe because he knew it would be stolen from him. He did not catch more game than he and his family could consume in a day because it would be carried away by others. But as soon as integrity was taught by the missionaries, the Indians began to construct their canoes which might perhaps be suggested as the beginning of our merchant marine. The Indians then began to preserve their game and that was the forerunner of the packing-house industry. Business enterprise is possible only when moral integrity obtains. Business enterprise and civilization itself are the products of spiritual teachings.

The difference between barbarism and civilization is a difference in the spiritual element. Even when civilization gets to a certain point, as we have it now, it can remain steadfast only as we pour religion into it. Civilization makes no progress until spirituality makes a jump and then civilization moves to catch up. That is what the labor situation is waiting to do. When there is an increase of spirituality among all groups, then there will be another great development in the labor movement, but not until then. No reforms can be forced through and be permanent. We can develop only as we co-operate with the spirit of God. Oh, if men would think more of religion and less of commodities, bank clearings, foreign trade and immigration! When they do we shall again have prosperity. Moreover, the present depression must last until this change comes about!

Exhaust Systems for Woodworking Plants

Size of Collector Important Factor—Stream-line Hood Design Does Not Retard Flow of Air—Floor Sweeps are Convenient and Often Necessary

By H. M. NICHOLS, B. F. Sturtevant Company, Boston.

(Continued from November Issue)

The resistance of a round pipe to the flow of air is inversely proportional to the fifth power of the diameter of the pipe. Therefore, handling a given quantity of air through a larger pipe at a lower velocity decreases the frictional resistance very materially and correspondingly decreases the horse power required at the fan and thus it is very desirable to keep the air velocities througout the system as low as possible, consistent with the major requirement that the refuse must be taken away as fast as made, without clogging the pipes, under the varying operating conditions met with from day to day in the mill.

After the size of the main trunk is fixed an exhaust fan should be chosen with an inlet at least as large as

Shavings exhaust installation in furniture factory. Note large double fan in top centre

the main pipe to which it is connected. If low power consumption is essential use a larger fan having 25 to 50 per cent greater inlet area. The discharge pipe leading from the fan outlet to the collector is usually made the same diameter as the main suction pipe.

Make Collector of Ample Size

The dust collector should be of ample size for the system. The larger it is, up to reasonable limits, the better will be the separation, the less will be the back pressure, and the less will be the power required. It has been the custom to use a collector whose nominal size is equal to the diameter of the pipe leading to it, but this is not good practice unless consideration is given to the proportions and general dimensions of the collector, since some makes are smaller than others for a given size number.

The suction required at the hoods varies from 1½ to 5 inches of water, depending upon many factors, such as the relative size of the hoods, condition of the material handled, etc. The volume of air required, resistance of the system, speed and horsepower of the fan is most easily determined by use of engineering formulas and tables for friction loss in pipes, flow of air for various pressures, etc.

The design and construction of the hoods is extremely important since they are required to guide the chips and refuse into the suction pipes and prevent them from falling back into the cutters or flying out into the room. Improper hoods are not always the fault of the blowpipe men as some machines will be found with old style chip breakers to which proper hoods cannot be applied.

Suggestions for Hood Design

In designing hoods, a principle to keep in mind is to shape them so there will be no eddy currents at the inlet. This can be accomplished by laying them out with the so called "stream line" effect, i. e. the sides of hoods should taper gradually to the pipes and also all abrupt bends within the hoods should be avoided. Particular care must be taken to shape the hoods so that the action of the cutters will assist the exhaust system by discharging the refuse in the direction of the flow of air and toward the throat of the hoods. To be most effective, they should fit the cutter bonds as snugly as possible, without interfering with the operation of the machine. The hoods must also be arranged so that they can be quickly swung out of the way for adjustment of the cutters.

All top and side head hoods require telescope or slip joints, for convenience in changing the cutters. The outside pipe of the slip joint should be heavily re-inforced at the bottom with a steel band or malleable iron casting. Movable head connections should be provided with cast iron ball points in order that the heads may follow the cutters to any position without

Shavings exhaust from large moulder, with floor sweep in foreground

interfering with the operation of the machine or lessening the suction.

For most conditions, hoods are constructed of galvanized sheet iron, the gauge of which, depending upon the strength and stiffness needed, should never be lighter than No. 22. Top and side heads to matchers and moulders, planers, and other heavy machines are usually made of No. 16 or No. 18 iron and for the lighter work 18 to 20 gauge is often used. The exposed edges of all sheet metal hoods should be bound with wire or band iron, not only to give the necessary stiffness, but also to prevent the operator being cut by the raw edges of the sheets.

Use of Floor Sweeps

With some types of wood-working machines it is impracticable to hood the cutters in sufficiently to catch all the refuse thrown off, and in such cases floor sweeps are placed near them. Also combination floor sweeps should be attached to the bottom heads of moulders and similar machines. The floor sweeps should be arranged so that all the material passing through them will be lifted from the floor by suction, thereby avoiding the possibility of large blocks and slivers being swept into them. They should also be equipped with tight fitting dampers or blast gates.

The conveyor pipes leading from the hoods to the fan and thence to the collector are commonly made of galvanized iron, the gauge of which varies from No. 24 to No. 14 depending upon the diameter. The piping must be free from dents, fins and projections of all kinds on which shavings and wood slivers might catch. All permanent circular joints should be lap-jointed, riveted and soldered, and all longitudinal joints either grooved and locked or riveted and soldered. Circular laps should be in the direction of the flow, and piping installed out-of-doors should have the longitudinal laps at the bottom.

All pipes passing through roofs require aprons to prevent water leaking into the building.

Straight Lines Desirable

The main trunks and branch pipes should be as short and straight as possible, strongly supported, and have the dead ends capped to permit inspection and cleaning. All branch pipes should join the main at an acute angle. The junctions being at the side or top and never at the bottom of the main. Neither should two branches be placed directly opposite each other. Dampers of blast gates should be installed in each branch pipe.

Cleanout openings having suitable covers should be placed in the main suction and discharge pipes as well as in the branches leading from the machines. Either a large cleanout door should be placed in the main suction pipe near the fan inlet or a detachable section of pipe, held in place by lug bands, should be provided. In some cases, where the piping passes through a firewall, it is desirable to install an automatic fire damper.

Elbows are usually made two gauges heavier than straight pipe of the same diameter, the better to enable them to withstand the additional wear caused by changing the direction of flow. They should preferably have a radius of at least 1½ times the diameter of the pipe.

The attention given to drying, before and after laying, determines to a large extent the success of the veneering operation.

Furniture Manufacturer at Ottawa

When the Dominion Parliament assembles at Ottawa, the furniture industry will have a capable representative in the person of James Malcolm, of Kincardine, Ont.

Mr. Malcolm was returned victor over Hugh Clark at the recent election by a good majority. This victory puts the Malcolm family in the ascendancy. In 1902 Andrew Malcolm, father of the present member-elect, was defeated by Col. Hugh Clark, father of the defeated candidate, by the narrow majority of five votes. Col. Clark was unseated on a petition but was returned later in a by-election with forty-four of a majority. In the recent federal contest the Malcolm family came out on top.

James Malcolm of the Andrew Malcolm Furniture Co., Limited, Kincardine and Listowel

James Malcolm is too well known to readers of the "Canadian Woodworker" to need any extended introduction. He is one of the younger school of furniture manufacturers and is actively connected with the Andrew Malcolm Furniture Co., Limited, of Kincardine and Listowel, and Malcolm and Hill, Limited, Kitchener, Ont.

Manufacturers to Tour West Indies

The Canadian Manufacturers' Association are attempting to organize a tour of the West Indies. The plan is to have about twenty-five representative Canadian manufacturers visit the various centres of the West Indies, to secure first-hand information as to the requirements of that market and to cement the business bonds which are gradually bringing Canada and the West Indies into a closer union. If suitable arrangements can be completed this tour will be undertaken early in the year. It is probable that several furniture men will take the trip provided the dates do not conflict with those of the furniture exhibitions.

Organizing the Woodworking Plant

Are You Successful in Training Executives?—Importance of Building Goodwill and Confidence—Give Preference to Men in Your Own Organization When Filling Vacancies

By W. WARREN

I do not possess any special knowledge or formula for organization. However, had I to again assemble an executive staff I would adopt similar methods to those which I have been employing.

To successfully carry on a woodworking business a manager must be ably supported by lieutenants or key-men. These men must be loyal to him and the same trust be reciprocated by the manager. It is, of course, presumed that a thorough understanding exists between the firm and manager, and if such is the case, the spirit of trust and good will can then be traced to the remotest parts of the organization; distrust, sedition, dissatisfaction and all other unhealthy conditions will then be conspicuous by their absence.

In selecting men, the principal qualification should be healthy men, clean in body and mind. A technical and scientific knowledge is a big asset, if accompanied with the former attributes, but if the whole combination is not obtainable, then the latter can be dispensed with, and preference given to the clean body and clean mind. Knowledge pertaining to the business will be the natural outcome when a man with strong moral fibre becomes firmly planted in a healthy business environment. Select men then that need only to be taught the business, good men who are already conversant with honor and honesty; the outcome will be buoyancy, optimism, enthusiasm and these qualifications will be transmitted to the remotest part of the organization.

Do not Fear Those Under You

No manager can build up an organization unless himself is held in high esteem by those around him. He must be truthful and impartial, sound in judgment and strict in morals, and if in possession of these virtues, will experience no trouble in rounding out his organization with suitable men.

There is, without doubt a serious shortage of men capable and willing to qualify for executive positions. This dearth of men has been brought about from various causes, one of the principal of which is an unwillingness on the part of those higher up to perpetuate their profession by handing on any knowledge they might possess to an apprentice or understudy. Quite frequently one comes in contact with an individual, who fondly imagines that to pass on any information, will enable these following to become contestants for his position. A man so constituted is selfish, living entirely for the present, all unmindful of the future. He is a misfit of no commercial value, and will prove a bill of expense to his employers, retarding progress and will contaminate any organization with which he happens to be associated. Employ only those men whose slogan is progress and expansion. A man who really loves his work or profession desires to perpetuate his calling, knowing that in trying to improve his understudies he is solidifying his own position and maintaining a lead that can only be assured in this way. He is elevating the standard of his profession.

Work Should go on the Same

It matters not what our position may be. We should at all times arrange our work so that in case of enforced absence, it will still go on without friction or loss. Our work may run with clocklike precision when we are present, but unless it functions just as satisfactorily when we are absent, then we are failures and certainly lack organizing ability. We do not pay sufficient attention to the selection and training of new men, nor do the beginners give enough serious thought to their calling.

Our managers, superintendents, foremen, etc., should, if possible, be selected from the rank and file, in preference to the importation of strangers. This inspires confidence and creates competition. It is, therefore, of the utmost importance that a supply of healthy, intelligent, enthusiastic men be continually in the making.

The human element is a tremendous factor in the lumber and woodworking business. We would not think of attempting to carry on without provision for future requirements of lumber. In this we are continually looking ahead, yet we make very little provision for our future labor needs.

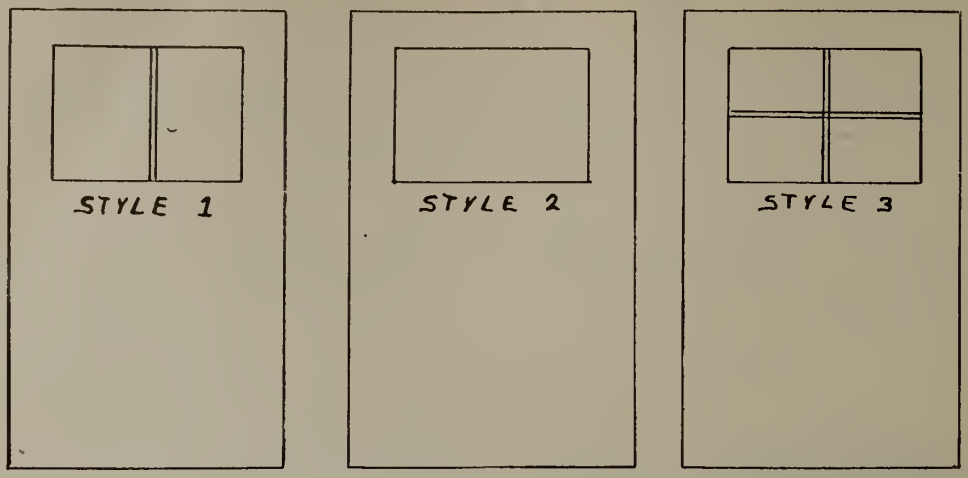
Importance of Efficient Staff

Our finished products are composed of two things, labor and material. In estimating or establishing the selling price of our goods, we must consider both factors. We can easily estimate the material because it possesses a definite value at point of destination, but here the labor with all its uncertainties steps in and the efficiency or non-efficiency of the organization will decide whether or not our transactions shall be profitable. The difference in the cost of handling can and does very often fluctuate 50% according to the efficiency or inefficiency of the methods employed. It will be seen from this how uncertain any labor estimate is. The remedy seems to me to be just this—Create a feeling of loyal, cheerful enthusiasm amongst the executives, and let it be generally known that work well and efficiently performed will not go unnoticed or unrewarded. This feeling will then be transmitted to the rank and file, and will reach the remotest operation and in turn reduce handling and manufacturing costs to a minimum. It will not only remove uncertainties, but it will tend to keep the workman's interest centered on his work on the exclusion of extreme views, antagonistic to his employer and harmful to himself.

It is of the utmost importance that the management keep in close and constant touch with the executives, but having given a man a definite piece of work, let him complete it. Do not under any consideration do it for him. Watch him closely and trust him fully, bring out originality and inventive.

These remarks may sound utopian and chimerical, but if put into practical use, will create a recruiting ground capable of supplying a man for every position in the woodworking business and efficiency will then be emblazoned on all our actions.

It is said that the furniture trade is now beginning to make some headway in the right direction.



Labor and material costs on 11 slab doors in Quartered White Oak, 1¾" thick, fitted with stops, as follows:—4 style 1 3 ft. 6 in. x 7 ft. x 1¾ in. 3 style 1 2 ft. 6 in. x 7ft. x 1¾ in. 2 style 2 3 ft. x 7 ft. x 1¾ in 2 style 3 2 ft. 10 in. x 7 ft. x 1¾ in.

Would You Make These Doors For $325.00?

Is it Probable that Costs Would Vary 45 per cent in Different Plants?—Check over Your Figures on These Doors and Compare With Actual Costs Given Herewith

The articles on "Cost," which have been a feature of recent issues of the "Canadian Woodworker and Furniture Manufacturer," have been the means of arousing a considerable amount of interest in this important subject. Too much emphasis can not be laid on the importance of accurate cost knowledge and the active support of every member of the woodworking industry should be given to any movement having for its object the elimination of guesswork in quoting on wood products. If you receive a request from the "Canadian Woodworker" for an estimate on some simple job, do not put it to one side, but send your figures in promptly.----The Editor.

Is the basis on which your estimates are figured an accurate one? Do you keep records of work done to serve as a guide in giving quotations? Do you know whether you make or lose money on every job turned out and how much? Unless the above queries can be answered in the affirmative, your business is not being conducted along sound economic lines.

Here is a test. Estimate the labor, both bench and machine, and material required to supply the doors shown in the accompanying sketch and compare the results with the actual cost figures given herewith. These doors were made by a well-known Canadian woodworking house and accurate records were kept of both time and material. As the equipment and methods employed in different plants vary, there is bound to be a slight variation in costs and estimates but such differences should not be very marked, roughly not over five to ten per cent.

For comparison purposes the "Canadian Woodworker" asked a number of manufacturers who are specially equipped for work of this kind, to submit estimates. The response to this request was gratifying. The following is a list of the quotations received. These figures are cost only, including overhead, and do not make any allowance for profit.

Quotation No.	Material	Bench Hours	Machine Hours	Total
1A	150.65	110	30	**393.80**
1				$316.00
2	$89.13	87	63	311.35
3	96.60	66	54	307.60
4	111.64	49	74	297.15
5	**94.83**	**78**	**57**	**281.65**
6	123.70	82	41	276.00
7	87.60	58	39	234.00
8	92.00	71	48	226.75
9	98.45	40	21	202.15
10	106.30	52	28	191.00
11	79.91	38½	27½	173.57

A glance at these figures shows that while several estimates are within striking distance of the real cost, No. 5, $281.65, yet there is a conspicuous lack of uniformity as to cost of material, hours of bench and machine work required and finally as to the total cost. The actual cost figures, which go to make up quotation No. 5, are as follows:—

Material:—

474 feet pine	$50.00	$23.70
28 feet Q. W. Oak	250.00	7.00
474 feet Q. W. Veneers	75.00	35.55
120 lin. feet stop.	1	1.20
		67.45
Plus 40 per cent waste allowance		27.38
Total Material		$94.83

Labor:—

Machine	56.45 hrs.	$1.20	68.10
Bench	78.25 hrs.	.90	70.58
Helper	2.0 hrs.	.60	1.20
Total Labor			$139.88

Material plus labor	$234.71
20 per cent commercial burden	46.94
Total Cost	$281.65
Add 15 per cent profit (nominal)	42.24
Selling price	$323.89

The total number of hours as shown in this cost is 135. One of the estimates submitted gave 61 hours as the required time and another 66, less than half in each case. In order to check the accuracy of the original figure the "Canadian Woodworker" compared the time with other jobs of a similar nature and found that it was substantially in agreement. The question that arises is then, if 135 hours is approximately correct, have the manufacturers who submitted 61 and 64 hours underestimated the labor? In other words, is the basis upon which they estimate inaccurate? A difference in equipment and plant organization might account for some variation, but it is difficult to conceive of the difference being over 50 per cent.

The Question of Waste Allowance

One concern figures the material as being worth $79.91, another $123.70, a third $111.64, while in the cost it is shown as $94.83. Why the difference? It is not likely that there would be any variation in feetage, for it is the simplest matter to take off quantities on a job of this kind. It means that each manufacturer puts a different value on his material and probably makes a different waste allowance. No uniformity. In quotation No. 9 the waste allowance is shown at ten per cent, in No. 11 at fifty on veneers and twenty-five on cores, in No. 4 at fifty per cent and in No. 5 (actual cost) at forty per cent. It is probable that those who allow from forty to sixty per cent waste on work of this kind are safe, but there is no doubt that ten per cent is away too low, and it is doubtful if twenty-five per cent allowance on the core is sufficiently high. There is a heavy jointing loss in building up a core of this kind, in addition to the usual trimming and ripping waste. Many woodworkers claim that a job of this kind should carry at least fifty per cent waste allowance.

The firm sending in the quotation for $316, intimated that their estimate would be found high for their policy was "quality first and at any cost." They d'd not come out so far at that. At any rate they are on the safe side, which should be a source of satisfaction. Would No. 8 at $226.75, No. 9 at $202.15, No. 10, at $191.00 and No. 11 at $173.57, make or lose on this transaction if some such nominal profit as fifteen per cent was added?

The Treatment of Depreciation in Production

Considered in Adjusting Fire Losses—Should Rate Vary During Periods of High and Low Production—Question of Replacing Woodworking Equipment Before it is Worn Out

By E. W. McCULLOUGH, Manager, Fabricated Production Department, Chamber of Commerce, Wash.

A factor reducing the loss is the depreciation existing at the time the loss occurs, in the determining of which depreciation enter such elements as the age of equipment, remaining useful life, whether the equipmetn has been handled carefully or otherwise, whether adequately repaired and renewed, whether driven to the limit or used within bounds, the location of the property, improvements in the art, local conditions and the status of the industry.

Evidence of depreciation is sought by direct, first-hand inspection and examination of the property, where that is possible. A thorough examination is made and a specific value and cost of repair are determined from the actual condition in which it is found. In any case, however, the depreciation written off on the books of the assured has a direct bearing and it is given the same consideration and weight as would be given to any representation made in good faith.

Depreciation taken on the books of the company is however, neither final nor binding upon assured or insurer. It is recognized that depreciation may be excessively or inadequately provided for, and book depreciation will be increased or decreased as the circumstances warrant. In no event do insurance companies attempt to limit the value of property at the time of a fire to the amount at which it is carried on the books of the company.

There is a general understanding on the part of fire insurance companies that as a matter of financial policy depreciation may be written off excessively or inadequately. There is on the other hand only slight recognition of the fact that obsolescence, physical deterioration and the other contingencies limiting the useful life of property may not at a given time correspond with the depreciation provided for by the accountant's regular fixed charges for those items.

It accordingly appears desirable that there be more extensive recognition of the distinction between the accountant's depreciation and depreciation for insurance purposes.

Adjusting Depreciation to Production

What can be done in a period of slow business recovery to ease the burden of fixed charges, particularly that arising from depreciation? The depreciation charge cannot be abandoned simply because profits are non-existent, for depreciation accrues whether or not there is a dollar of profit. But is the full normal charge for depreciation any more justified in a period of half-time production? Obsolescence is supposed to develop whether the plant is idle or running, but even this has been questioned. The difficulty of getting new capital in a period of depreciation alone thwarts the introduction and development of improvements, and concerns struggle on with equipment that might otherwise be scrapped.

Even granting the presence of obsolescence, wear and tear are ordinarly less when a plant is running half of its accustomed capacity. During war-time production equipment was operated at pressure far above normal, entailing extraordinary wear and tear, to compensate which an extra allowance for depreciation was recognized as necessary.

If this was so, if excess operation meant excess depreciation, is not the converse true? Does not light operation warrant a scaling of depreciation? Are

manufacturers not justified in minimizing their losses by adjusting depreciation charges to the flow of depreciation? Fifty per cent production does not warrant the abandonment of depreciation charges or even at 50 per cent reduction, if obsolescence proceeds irrespective of production, but cannot a point be determined somewhere between 50 per cent and 100 per cent of the normal depreciation allowance which would correctly represent the situation of semi-normal production?

An illustration, supplied by a manufacturer of metal products, which indicates that an estimate of depreciation based on expected performance can become very exact. This company calculates its depreciation on Ford cars used by its salesmen at 2 cents a mile and reports that the last thirty cars sold, exchanged or scrapped showed an average depreciation of 1.9 cents per mile and that these thirty cars were operated between five and six hundred thousand miles in all.

The attuning of depreciation to the flow of production is thrown out for thought and discussion in a year of slackened production and demand, when the fixed expenses of operation fall particularly heavy upon the shoulders of business men.

Operating Department Can Aid

Depreciation is in part inescapable and in part unwarranted. Wear and tear cannot be entirely made good even by the best of care. An expanding business outgrows plant and equipment, new improvements send even functioning machinery to the scrap pile. That is all true, but carelessness unnecessarily curtails the useful life of assets. Thus a correspondent writes in to the Department:

it is in the hands of a careless operator it may be

"In the hands of some competent operators, for example, a band sawing machine may be just as good fifteen years after it is built, whereas if worn out in six or eight years."

This would indicate in the particular illustration at least a 50% margin of preventable depreciation.

Waste is rarely due to design; nearly always to carelessness. The proper and regular oiling of machinery, the adjustment of bearings, the proper conditioning of belts and a discriminating use of the hammer and monkey wrench, all aid equipment to render that service for which it is designed, while timely and careful repairing will save many a machine from the scrap pile. Require your operating department to eliminate unjustified depreciation.

A distinction is necessary between maintenance, the purpose of which is to keep property at its present general condition, and renewals and replacements, which ,tend to prolong the useful life of property since maintenance is met from current expenditures and renewals and replacements are charged against the depreciation reserve. Extreme cases of maintenance and renewals and replacements are easily enough classified. Thus, the repairing of a broken window-sash is maintenance, the laying of a new roof a renewal, but there are a host of border-line cases defying definite classification, and accountants as a practical proposition fall back upon an arbitrary sum above which it is a renewal, below which it is a repair. This standard should be kept low or it will result in charging capital outlays into current costs.

Obsolescence An Important Factor

The importance of obsolescence as it affects the useful life of property is not entirely appreciated. Before it wears out, property is generally replaced by something bigger and better. Give the modern business man a machine that will render better and cheaper service, and he will scrap his present equipment, even though the paint has not worn off.

In response to a request for the useful life of a woodworking machine, the following characteristic reply was received:

"We wish to advise that we buy the best and heaviest woodworking machinery built, and while we use this equipment hard, we keep our plant to date, and are constantly purchasing the latest equipment and replacing the old with same. Consequently we have never had a machine in our service long enough to wear it out or even to wear it to the point where we felt it was nearing its end, and consequently we are not in a position to state from actual experience the exact life of any piece of woodworking machinery suitable for our requirements."

The useful life of property is strictly limited by the law of the survival of the fittest. Machinery is replaced not because it has worn out, but because there is something in the market which will do the job better. In determining the useful life and rate of depreciation of machinery and equipment give this factor of obsolescence the consideration and allowance it deserves.

Avoid Rule-of-Thumb Rates

Depreciation is not complex, not simple, but the difficulty of the task of computing depreciation does not warrant the abandonment of it. There is altogether too much reliance on rule-of-thumb typical rates of depreciation,—2 or 3 per cent for buildings, 5 or 10 per cent for machinery, 20 per cent for trucks, etc.

The best judgment regarding depreciation would be only an approximation frequently belied by subsequent experience, but there is a difference between guessing and estimating. A guess cannot be justified. It is a hit or miss affair. An estimate of depreciation attempts to take in all the factors governing a given situation, to assign weights and importance to them, to rely upon past experience and actual inspection of property, to differentiate between the various kinds of machinery, buildings, etc., and to apply depreciation with reference to a particular asset or group of assets. The need of classifying property will be more fully discussed in connection with recording depreciation.

It should, moreover, be recognized that the depreciation experience of any one firm however large, is limited and should be supplemented and modified by the experience of the industry. Each industry, with the aid of its technical men, should establish for itself standard rates of depreciation, which rates should be set upon defined conditions and after agreement as to the line separating repairs from renewals. Tables of depreciation built up from group experience can be accepted as indicating the normal, customary and usual depreciation. They are, however, not designed to meet all contingencies or to take the place of private judgment. It is expected that adjustments of these normal rates either upward or downward will be made to suit the individual requirements. In the last analysis the individual must determine his own depreciation allowance.

(Concluded in January Issue)

Largest Hardwood Flooring Industry in British Empire

Canadian Manufacturer has Four Plants Devoted to Production of Hardwood Flooring—1,735,000 feet of Lumber Always on Wheels

It is doubtful if few, or any, not immediately connected with the firm of Seaman, Kent Co., Limited, Toronto, have any idea of the magnitude of the hardwood flooring operations conducted by this concern in the production of their well-known brand of hardwood flooring. Here we find four large plants devoted exclusively to manufacturing flooring, two in Ontario and one in Quebec, and the output of a fourth

Frank Kent, Managing Director,
Seaman, Kent Co., Limited, Toronto

plant at Midland, Ont., under contract. To put it into terms of consumption and production, these four plants daily cut up about 95,000 feet of 4/4 hardwood, producing in the neighborhood of 80,000 feet of finished product. More than that, this huge operation has been working at normal capacity all through the quiet period from which we are gradually emerging. It is said to be the largest hardwood flooring industry in the British Empire.

The Seaman, Kent Co. are too well-known to need any extended introducton. They are strong believers in advertising and have a publicity department which is on duty twenty-four hours a day. One finds their advertising in numerous well-known publications, in the daily newspapers, on billboards, in various depots and in unexpected places. A little over two years ago they had moving pictures taken, showing the different operations in the manufacture of flooring, from the felling of the tree to the laying and finishing of floors. These were exhibited the length and breadth of Canada and then taken to Europe. Another publicity stunt was the promotion of "Hardwood Floor-in Weeks," which were held in many centres and which aroused a considerable amount of interest.

This company was organized in 1899 with headquarters at Meaford, Ont., where the parent and largest plant is located. Here six hardwood flooring units are in operation, chiefly on maple. The output consists of 3/8 in., ½in., 13/16 in., and 1⅛ in. material, in the usual standard widths, and averages about 42, 000 feet of finished flooring per day.

At Meaford, which is located on the shores of Georgian Bay, there is a good harbor and ample docks to receive lumber by water. A large quantity of maple is received every year from Michigan and ports on the Georgian Bay. As an evidence of the company's capacity to handle lumber, a few weeks ago a cargo of 621,000 board feet of maple was unloaded in two days and a second cargo of the same quantity was unloaded more recently. The company's buildings at Meaford are constructed with the view to permanency, being built of cement brick, steel and wood. Heat, sanitary and other conditions have been carefully considered to provide every comfort for the men. A modern automatic Goldie & McCulloch engine of over 600 h.p. provides power for the main plant. A separate engine provides light and a third engine circulates heat through the dry kilns.

Oak Flooring Exclusively

At West Lorne is located their latest acquisition. This was formerly a wagon factory but has been converted into an efficient oak flooring plant, which is claimed to be the largest factory devoted to oak flooring in Canada. The layout of yard and factory is such that the stock progresses through the various operations with a minimum of handling. This plant specializes in oak flooring in red and white oaks. The product includes square edge stock and 3/8 and 13/16 tongued and grooved flooring.

Excellent trackage facilities are enjoyed, the tracks running through the lumber yard and then between the factory and warehouse. The transfer truck for the kiln cars is built to conform to the gauge of the railroad track, and travels back and forth on this line. Thus the tranfer car can be taken out into the yard and loaded direct from the lumber piles. At the present time a limited amount of storage space has been equipped with rails to hold loaded kiln trucks. As far as possible these are loaded directly from the incoming cars of lumber. Any surplus stock is piled in the yard on either side of the railroad track. The kiln truck storage space is being extended and will eventually be able to handle all the incoming lumber. The practice is to have a steady stream of lumber coming from the mills rather than attempt to accumulate a large reserve stock at the plant. The requirements of this operation are about 16,000 feet of oak a day.

Lumber Thoroughly Dried

The kilns, which are three in number, are of a progressive type, the material entering at one end and progressing through to the dry end. The capacity of each kiln is nineteen cars, each car holding 4000

Views showing the four factories operated by the Seaman, Kent Co., Limited, Toronto.

feet, so that the total capacity of the three kilns is 228,000 feet, with a daily output of 16,000 feet of dry lumber. The stock is first steamed and then dried at a temperature of 140 to 145 degrees. The humidity of the air drops as the lumber approaches the dry end. About seventeen days are required to bring the material down to the required degree of moisture content. Handling of the loaded cars in the kiln is facilitated by a winch which has been placed convenient to the dry end. A rope is passed under a row of cars and fastened to the last car; then the whole nineteen are moved forward the width of a car.

The kiln trucks, with the dry lumber, are rolled out into the plant and placed adjacent to the gang edger. As the name implies, this machine is equipped with a number of saws, eight, to be exact. The first three are set to cut 1¾ material; the next two spaced for 2-inch stock, while the last three take care of the strips for 1½ in. face flooring. The two outside series of saws are worked from the outside edges of the bed, moveable gauges being used when cutting 2-in. strips. As it works out in actual practice, many of the wider pieces are cut into 2-inch and 1¾-inch strips, the gauges being so manipulated that each board is ripped with a minimum of loss.

From the gang edger the strips go either direct to the hardwood flooring machines or to the resaw depending on whether 3/8 in. or 13/16 material is being run. The edgings are taken from the power-feed ripsaw and cut down for ¼ round and coves. Factory trucks handle the strips between these different machines.

Modern Equipment Used

A battery of four machines, three American hardwood flooring matchers and one "American" moulder, placed side by side, take care of the next operation. Three of these machines are kept continuously on flooring, while the moulder is used to run cove and ¼ round. Needless to say, these are equipped with all the latest production devices, including high speed knives, jointing attachments and other equipment that ensures high production and good work.

The end matching is done on two pairs of "American" single end trimmers and matchers. These machines are automatic. The endless chain feed squaring the material and carrying it past the trimming and matching saws. The machines are set up in pairs, each machine handling one end of the stock. The flooring strips fall on a large table as they leave the matchers. This leaves the material convenient to the operator of the first end matcher. After passing through the latter machine, the piece falls on a belt conveyor which carries it to the second end matcher where the other end is trimmed and matched. The piece now falls on another belt conveyor and is carried up through the floor to a sorting table on the floor above. Here the material is graded for color and grade, after which it is passed to the sorting racks where the different lengths are segregated. The strips are now bundled, stamped with length and grade and placed in the warehouse where they await shipment.

Output Carefully Watched

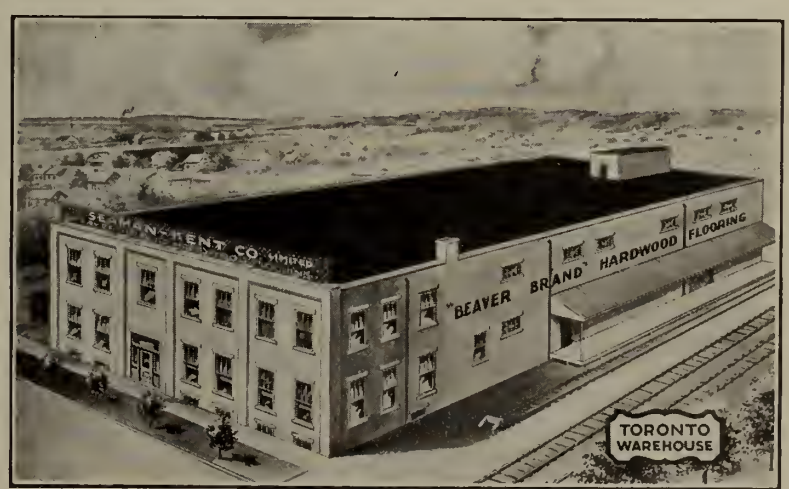
A very close check is kept on the output. Tally meters have been placed on each matcher and readings are taken daily, showing the output of each machine. An accurate record is also kept of the amount of material bundled, showing the different widths thicknesses and grades. This information is tabulated in a special perpetual inventory book, against which all out-going shipments are checked, thus providing a perpetual inventory of the stock on hand.

As far as possible, all waste is turned to profitable account. Any edgings, which are too small for mouldings, are cut to stove length, bundled and sold as kindling.

Special attention is given to fire protection, different preventative measures having been taken. The floors are kept free from sawdust and shavings, two Sheldon shavings exhaust systems being installed for this purpose. The buildings, including the warehouses, are equipped with automatic sprinklers, while a fire pump has been installed to provide a good pressure at the hydrants located at convenient points around the plant. The workmen have been organized into a fire brigade and given sufficient instruction so that in the case of a conflagration, each man will know what to do and what is expected of him.

The Quebec plant is located at St. Agathe, and produces birch almost exclusively. This plant is located in the Laurentian range of mountains, from which comes the finest quality of Canadian birch. The

Head Office and
Warehouse,
Toronto, Ontario



How the Buyers Door & Mfg. Co., Limited, Toronto, display their line to good advantage.

St. Agathe plant is also the largest exclusive birch flooring plant in the Dominion. The output of this factory is sold largely in the eastern provinces, including the city of Montreal. For years, however, a very considerable quantity has been shipped to the New England States, where "Beaver Brand" is becoming well and favorably known. In the city of Montreal the company have their own office and warehouse for the efficient distribution of Beaver Brand birch flooring in the city and outlying districts.

1,735,000 feet on wheels

The total dry kiln capacity of the four plants, at one time, including the Midland factory, is 1,285,000 board feet, in addition to which there is storage track capacity, including the cooling rooms of approximately 1,735,000 feet of lumber always on wheels. Experience has taught this company that it pays well to leave lumber in the cooling rooms long enough to thoroughly cool off before going to the machines.

A large warehouse is maintained in Winnipeg with a capacity of 500,000 board feet of flooring, where a well-assorted stock is always on hand to take care of the western market, and a few weeks ago another warehouse was opened at Edmonton to provide better service for the province of Alberta, including the Peace River country now opening up.

During the last summer a show-room and sales office was opened in Hamilton on one of the main streets. This is maintained in conjunction with the Consumers' Lumber Co. In this sales office a full line of floor finishes, brushes and other accessories are carried and the large volume of sales is good evidence of how the trade appreciates this convenience. The Consumers' Lumber Co. carry a full stock of flooring in warehouse to facilitate quick despatch.

The Seaman, Kent flooring industry maintains a total payroll of approximately three hundred and twenty-five. It is anticipated that this number will be largely increased when building operations again become normal.

Displaying Goods to Advantage

There is an old saying that "well bought is half sold," but a modern version of this might read "well displayed is half sold." An article must be priced right to command a ready sale, but how much easier it is to make the sale when proper display facilities are available. The manufacturer of wood products seems anxious enough to make the price reasonable and instances are not lacking which seem to indicate that he often sells below manufacturing and replacement costs; he seemingly has not, however, come to realize the value of displaying his products to good advantage.

An attractive display of any line not only aids the prospective purchaser in making an intelligent and satisfactory selection, but assists the salesman in many ways for having the article in plain view relieves him of the necessity of doing a lot of descriptive talking. Another point is that when the full line is displayed in an attractive manner, the attention of prospective purchasers is often attracted to items which he might have overlooked or which he even might not have considered.

It is gratifying to note that certain woodworkers are beginning to realize the possibilities which lie in this direction. Some are fitting up attractive salesrooms furnished with comfortable furniture and around which the various products are shown in an attractive manner. Here the customers may be taken to discuss plans, examine woodwork and material and finally to place the order.

The accompanying illustrations show part of the general office of the Buyers Door & Manufacturing Co., Limited, Toronto, and indicate how they have arranged their doors and woodwork for display purposes. One can readily see how this has many advantages over conducting the customer to warehouse or factory. It adds tone and dignity to the organization and is in many ways conducive to increased sales.

The hopper feed on many machines would save a great deal of time and labor.

How Wood Boxes Are Being Developed

Relation of Thickness of Sides to that of Ends—Better Utilization of Box Lumber—Minimum Number of Pieces Compatible with Strength

By J. A. NEWLIN

In an address before the National Association of Box Manufacturers' during the convention held recently at Atlantic City, J. A. Newlin, of the Forest Products Laboratory, Madison, Wis., gave a very interesting outline of the work and aims of the Laboratory at Madison. He referred particulary to the research work being conducted in connection with the development of wood boxes. The following interesting excerpts have been made from this talk:

You doubtless know what the Forest Products Laboratory is. As I tell my fellows, they don't want to forget that we are a bunch of men working for the best interests of the people and that we are merely working with wood. We don't want to try to put wood in the place where wood is not suitable and while we are working to the best interests of the people along my line, I believe it is impossible for us to work against the industry along that special line, that the two interests are one and the same.

In connection with the packages, we are trying to develop a package that, with the least expenditure of money will get the material to the consumer in the best possible condition. There was some mention made this morning as to the amount of loss and damage claim. I don't know, I'd put it at less that ten million due to the poor containers, but that loss I think is a small part of the total economic loss due to poor containers, bad packages, oversized packages and overweight packages, and if you will take all those things into account, the loss, the economic loss will be many, many times the rather small amount that you get back from the railroads.

Work of Laboratory

I would like to review a little of the work of the laboratory for the last ten years very briefly. In fact, this work of boxes, and I of course commenced it about sixteen years ago with the crushing test on the corner and with various machines that brought out to the engineer the necessity for more nails. It didn't bring out to the practical mind the necessity for more nails nor did it emphasize that necessity to the engineer to the extent that it should have emphasized it.

We have gone along in the development of methods of testing till I believe we've got the tests that do show serviceability pretty well although we are not satisfied that we are to the best, at all. We've got a new machine at the laboratory that I expect, when I get back, to give all the motions of a car in transit and see how that continual weaving of the works the nails out under different conditions and just what happens to the box there as well as this tumbling as well as the steady loading. There never has been a test developed that will give you the whole story, there never can be.

Of course you've got to take a look at the boxes in the transit and see how they have held up, but that is the final record without doubt. We have tested about 150 species of wood in the Forest Products Laboratory, I don't remember the exact number, and have made about half a million tests of various kinds. We have had practically all, you might say all of the woods of commercial importance in the laboratory and with most of these woods I have had the experience not only as testing but in their use and from observation on wood in the laboratory, from talking over with all the men that I have met, we made this grouping of woods that you see for the boxes.

We know that under certain conditions grouping is not just what we would have it if it was under other conditions, but it has been as near correct as we know how to make it and I can't see, after some four or five years since we first got it up where we could change it and better it.

Some of The Problems Tackled

We have been working on a nailing schedule. The nailing schedule has been tried out by tests and by observation on boxes in transit and that nailing schedule will undoubtedly make splendid boxes if it is followed.

We have been studying the relation of the thickness of the sides, top and bottom to the ends. With the ordinary Style No. 4 box, we find that we've got the best balanced construction with the sides, top and bottom about two-thirds, not over two-thirds the thickness of the material. Of course with this style of box, the Style No. 2, the thickness of the sides, top and bottom should be about two-thirds the thickness of the cleats.

As you put in wiring, strapping, you can reduce the thickness of the sides, top and bottom. The fact is that if you go beyond about three-quarters, you get such a stiff box that the jars are all transmitted to the nails and the box comes to pieces easier than though you'd use thinner lumber. But as to the thickness of end, you never reach a place where a thicker end would not make a stronger box. You reach a place where a thicker end would not be abvisable because the expense would not permit and the serviceability would not run at all with the expense, so that is the determining feature.

We have been studying the strapping during the past year and will continue to study strapping although not quite so vigorously during the coming year. We have learned enough about strapping so that I think tentative rules can be presented very shortly for your consideration and for your observation of those rules in practice.

Studying Suitability of Lumber

.. We have gotten in the laboratory about two carloads of white pine from the New England states. We realize hat it is essential that we use the very lowest grades of lumber in box construction. The New England white pine is a very good box lumber. We want to know, though, how closely we can use that to economy. In that we are not trying at all to introduce an element of waste, we are trying to introduce an element of conservation.

If you put in larger knots, too large knots, you will have to thicken the sides, top and bottom beyond that which they would otherwise need, and that increased thickness in material would be a bigger waste than

throwing out a little knot once in a while. When you nail up a box and you get knots in the nailing edge, if the board comes off you've got a loss.

How many of those boards are going to come off, and how much trouble can we go to in trying to eliminate that loss and make it pay? Every elimination of a defect must be made to pay. If it doesn't pay, then we don't want to try to eliminate it. We've got lumber in there and are making a very careful study of the influence of those knots on the properties in the thickness of the material that it would have to be used and then when we can get that and go around to your factories and get your end along with it, then we will be ready to specify as to allowable knots in box lumber.

At the present time we are not ready to specify at all, but as I say, all these things have got to be made to pay and not made something that is going to entail a loss to the box industry because if it does it's a loss to the people.

Number of Pieces Permissible

Another thing that we haven't got sufficient information on is the influence of the number of pieces on the strength of the box. We know that the influence of the number of pieces on the strength of the box is as nothing compared with the influence in the number of nails on the strength of the box from our observation of the tests that have been made, but we are not in a position to rightly say whether or not you must limit the number to any specified amount or whether you want to limit it at all. We can't do that with any accuracy at the present time. That is one of the things that we would like very much to study as the time goes on, will study it more or less with the lumber that we have but during this year with our funds that are available we will not be able to make much progress along that line.

Another subject that wants to be studied is tongues and grooves and their influence on the strength of the box. It may be that on these narrow pieces where they are tongued and grooved that we get our nailing on each side of the narrow board and the shrinkage in weight is very small and the tongue would stay in position and it wouldn't matter materially even if a piece were entirely missed at one end with the nails. I don't know whether that is true or not. We want to find out.

One thing that we always try to do there at the Laboratory is to clear our minds of prejudice and if we have had some preconcieved notion and there comes something up that appears to indicate that we are wrong, we go hard after that thing until we find out the truth and then we try to put ourselves in line with that new fact that we have discovered and I find that those, when we find some new fact that way that upsets some previous thought or conception, that we are nearly always or we are always better off for having found that; it does not, except for the immediate future, upset things. The immediate influence at times is to upset conditions and the application of the new fact would have to go slow, but we always have to line ourselves up with the facts.

Proposition of Box

Another thing that we are studying to a certain extent but only incidentally at the present time is the thickness of lumber in relation to the weight that we are to ship, the size of the box, the commodity which is to be carried and the service, whether foreign or domestic and things of that kind. Now that is a big study and it will necessarily take some years before we get the final answer, but when we get the answer to these problems from which I have indicated we have partial answers and those that we have only just touched, I feel then that we will be able to get a specification that will be a real specification that will tell you how to make a box that can best compete with all other boxes on the market, and that is the thing that the people of the United States, the box manufacturers, are all interested in. "Can we make the box that will give the maximum of service at the minimum of cost?"

Made in Galt Exhibition

The manufacturers of Galt, Ont., of which there are a considerable number, recently held a successful Made-in-Galt Exhibition. The displays covered a wide range of articles and were so numerous that they filled two rinks. It came as a surprise to see the variety and the quality of the lines produced in Galt.

Of particular interest to the readers of the "Canadian Woodworker" would be those dealing with wood products or wood-manufacturing equipment. Such displays included the Victoria Wheel Co., Limited, showing shafts, rims, spokes, whippletrees and bent handles; the Galt Wood Products Co., displaying sleighs, ironing-boards and clothes-horses; McDonald Bros. with their line of kitchen tables, wood turnings, tea waggons, cedar chests and lamps; G. W. Gardiner & Son showing doors, sash, frames, columns and woodwork of various kinds.

The following manufacturers of machinery and equipment had attractive displays:—Canada Machinery Corporation, who showed their ball bearing band saw and ball bearing shaper being driven by the motor of a small portable electric house fan: Cowan & Co. of Galt, Limited, were displaying such machines as pony planer, hollow chisel mortiser, jig saw, chain mortiser and power feed rip saw: Shurly-Dietrich Co. made a very attractive display showing their complete line of saws and tools against a background of black velvet; this exhibit covered the walls at one end of one of the rinks: The Shimer Cutter Head Co. and the Galt Knife Co. made a joint display of profile, matcher, shiplap, sash and door, and special heads, also plain and milled knives, mortise chisel and special knives. The Sheldon Company showed their well-known Keith fan and had a small model plant fitted up with a shavings exhaust system. The Sturtevant Co. of Canada, Limited, made a display of their shavings exhaust and ventilating fans and also a portable electric vaccum cleaner which they are manufacturing.

Turning Wood Waste into Profit

The Andrew Kaul & Co., Incorporated, of Merrill, Wisconsin, are deriving a nice profit from the waste from their large woodenware plant. This waste was formerly sold at $6.00 a cord. At the present time it has been turned into a wide variety of articles, such as rolling pins, pail and knife handles, bowling pins, spools, bobbins and wooden plugs for paper rolls. They find a steady demand for all these products. Another line they are handling successfully is waggon wheel hubs, spokes, automobile spokes and felloes. Sufficient orders are in hand to keep the spoke and wheel department busy for the next twelve months.

There is a good suggestion here and it can be profitably followed and adapted to other plants and lines.

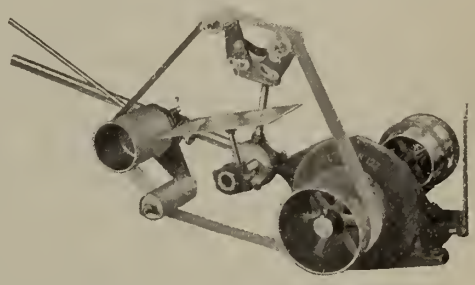
Machinery & Equipment

Plate Gluing Device

There are several methods of applying glue to the edge of stock when making glue joints. It may be applied with the brush, roll or plate spreader. The accompanying illustration shows a type of plate spreader which is being placed on the market by Jackson, Cochrane & Co. of Kitchener, Ont. The method of operation can be grasped readily from this cut. The operator picks up whatever number of pieces he can handle conveniently and then presses the foot lever which lifts the perforated plate up out of the glue, so that by simply resting the edges of the stock on the plate and then moving the material backward and forward about one inch, the edge will be completely and evenly covered with glue. When the foot lever is released, the plate drops back into the glue and is ready for the next batch. The plate has a large number of perforations of proper size and so placed as to allow surplus glue to drip back into the tank and leave only sufficient glue between the perforations to give the stock an even application and to prevent waste. The spreader is steam-jacketed, so that the glue is always warm and ready for instant use. The inner tank, which holds the glue, is lined with heavy copper. The tank is fitted with a water faucet and the glue valve for drawing off surplus glue. An overflow pipe and a safety valve prevent back pressure in case the overflow pipe becomes clogged. This spreader is made in two sizes, 5 ft., 11 ins. and 7ft., 11 ins., inside measurement. The tank is 5 ins. wide and 5 ins. deep, while the perforated plate is 4 ins. wide and 1 in. shorter than the tank. This method of gluing joints is claimed to offer a considerable saving of time and glue over any other method and should greatly increase the capacity of revolving glue clamps wherever the latter are used.

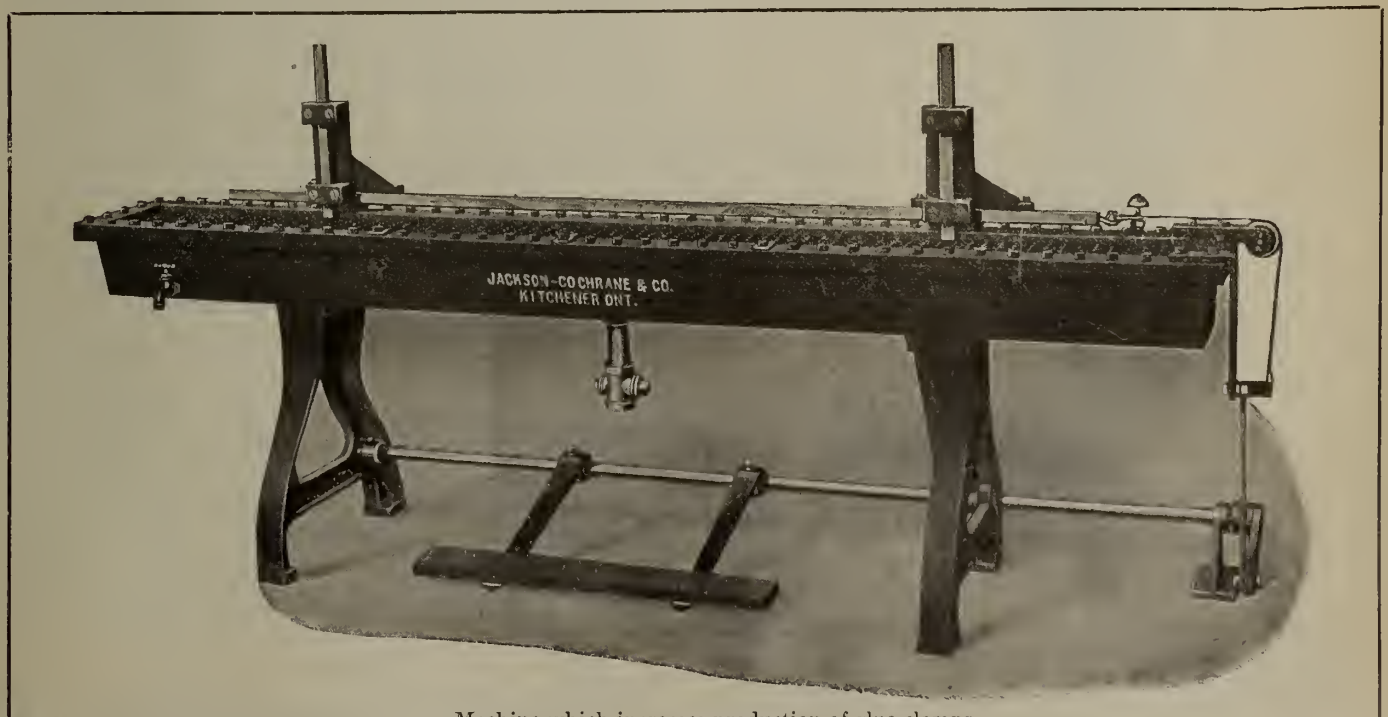
Flexible Belt Sander

A flexible type of belt sander, designed primarily for the rapid sanding of all kinds of small and irregular-shaped pieces, such as brush backs, toilet seats, frames, period legs and various other shapes common

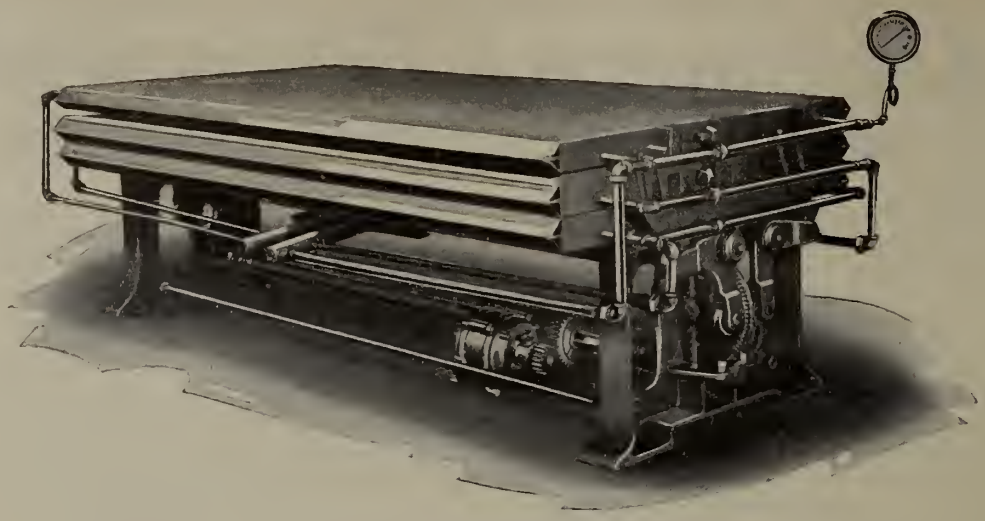


Showing how Oliver flexible belt sander can be adapted to special operations.

to furniture factories, is shown in the accompanying illustration. This is known as the "Oliver No. 127 Variety Belt Sander," and is manufactured by the Oliver Machinery Co. of Grand Rapids, Mich. The principle of this machine involves a main drive pulley mounted on a counter-shaft so that the entire frame swings about the centre line of the counter-shaft. On the supporting arm are carried two clamp racks for

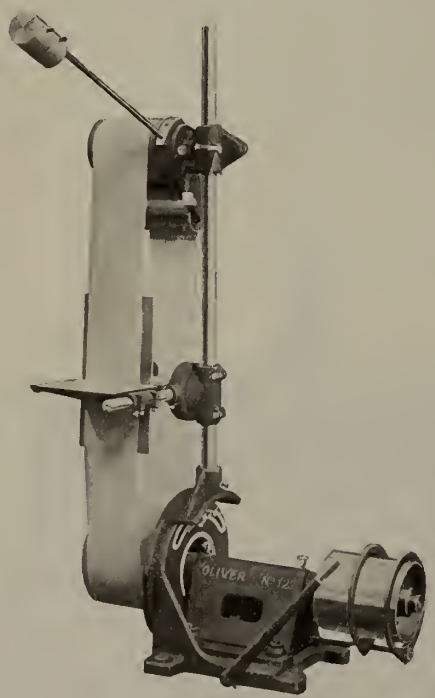


Machine which increases production of glue clamps.



Three plate veneer re-drier for small plants.

supporting the main idler pulley and the tension idler respectively. Another supporting arm carries the table and backing plate, or for special work special air flexible pads may be carried in place of the plate. The machine will accommodate belts up to 10 inches wide and as long as 14 feet. The edging table tilts up or down to 30 degrees. The backing plate is 10 inches wide and can be adjusted in or out to suit tension on the belt. It has holes for attaching flexible pads. The main idler runs in ball bearings and is adjustable up or down the whole length of the idler arm, thus



Flexible belt sander used as a vertical machine.

enabling it to take care of belts of various lengths. This pulley is faced with leather. The fork idler may be mounted on the machine in place of the regular table. It is used for doing oval sanding, such as oval frames and other irregular shapes. This idler is of rigid construction and carries two aluminum idlers running in ball bearings. The machine is 80 inches high and requires a floor space of about 4 x8 feet. It should be driven at 900 r.p.m. and requires 2 h.p. It may be had either for belt or for direct drive by electric motor.

Three Plate Veneer Redrier

The October "Canadian Woodworker and Furniture Manufacturer" contains a description of the Merrit Balances Plate Veneer Redrier for the redrying of veneer and crossbanding stock. The Merritt Engineering & Sales Co., who manufacture the above machine, have placed on the market a new piece of drying equipment in the shape of a three-plate veneer redrier. This machine has two openings only and is designed for the smaller plants who have not sufficient work to warrant the expense of a large capacity machine. This new redrier is electrically-driven and is bought for connection with the factory steam line. A vertical movement of the metal plate gives pressure first in one opening and then in the other and provides the well-known breathing movement peculiar to Merrit hot-plate redriers. This machine, which is shown in the accompanying illustration, flattens and dries at the same time. The heat is applied uniformly to both sides of the stock and to the edges and ends so that no one part dries faster than another. This, coupled with the releasing of the pressure during the breathing movement, eliminates the liability of checks and splits appearing. The flattening of the stock is a matter of no small importance. This is especially true of face material. A sheet that is wrinkled or corrugated is hard to joint and does not get an even distribution of glue when going through the spreader, requiring a heavy applicaiion of glue to prevent loose veneers or blisters. The drying of veneers and crossbanding is receiving more attention than formerly because the necessity of having such stock thoroughly dry at the time is more widely realized. For this reason the demand for equipment of this type is increasing.

If a saw is not jointed frequently two-thirds of the teeth are often out of commission by being too short to touch the wood.

Upholstering and Trimming

Modern Upholstering

Describing Application of Down Cushions to Chairs of Various Types

There are many types of down-cushioned chairs for which the upholstery instructions would be practically the same as for the chair, which, up till now, has been described in this series. This would include such chairs as Figs. 53, 54, 55, 56, and 57, for while they differ somewhat in arm construction, the main body of the upholstering is executed after the manner already described in connection with Fig. 41.

On Figs. 53, 54 and 55 there is a scroll, which is a continuation of the curve of the arm. The covering of this is planned to be continuous with the arm covering, and a seam, which is concealed by the cushion, joins the two sections, allowing for a sufficient amount of padding on the block, so as to make a smooth surface to the body of the column. The scroll face of the arms being put on subsequently conceals the edges, while the lining of the outside arm and the covering of the front nosing and rail complete the operation.

Fig. 56 is not sufficiently different from Fig. 41 to require any extra explanation, the principle of upholstering being exactly the same.

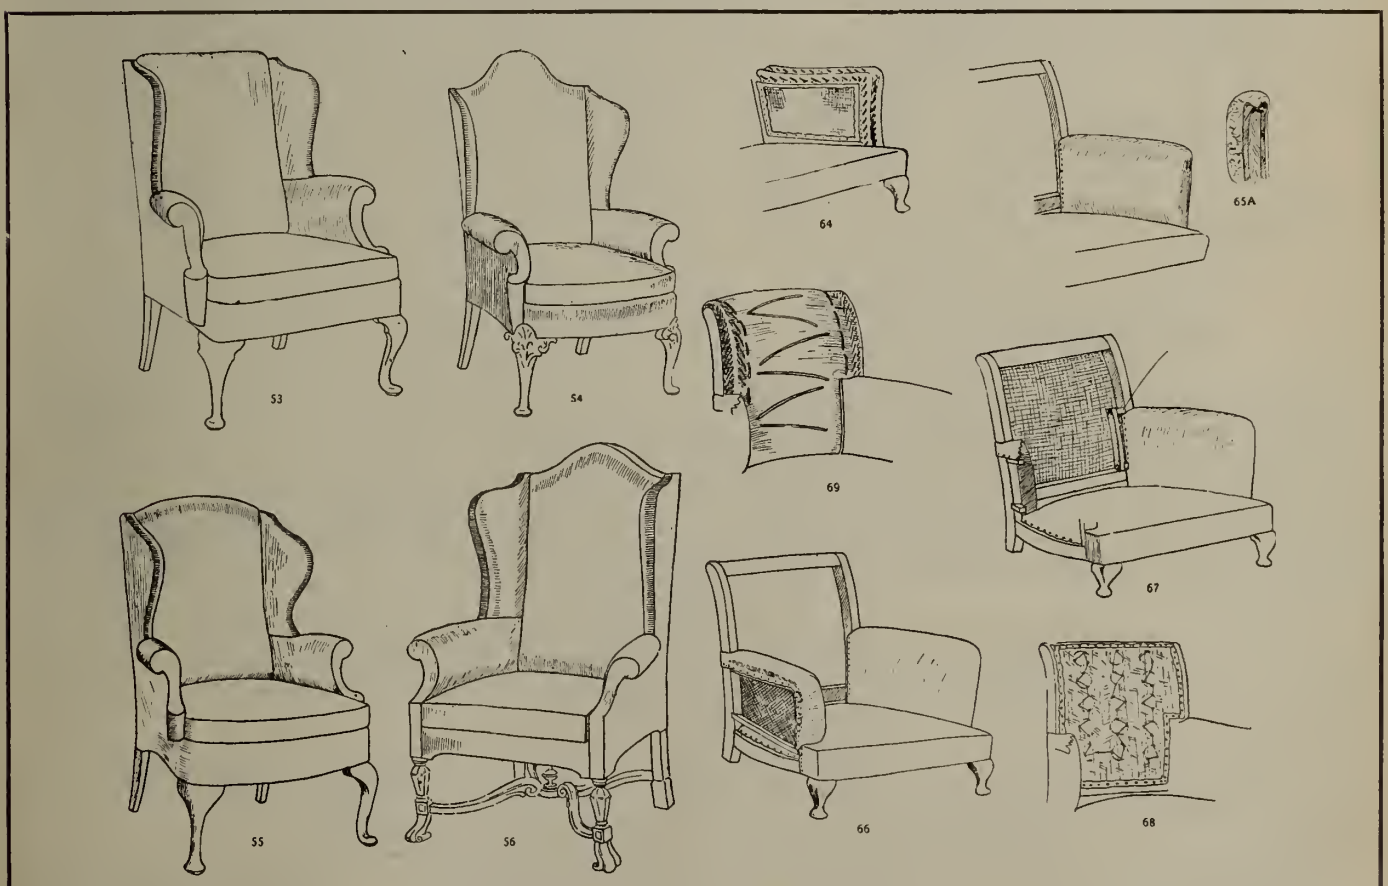
Another Type of Chair

We will take up another type of furniture for the further elucidation of the subject of down-cushioning.

A soft filling of hair is now employed to fill the crevice formed by the stitching of the two rolls, giving the entire arm a symmetrical shape, as indicated in Figs. 65 and cross section 65A. The other arm is treated in the same way and the chair will then present the appearance of Fig. 66.

It will now be necessary to arrange for a block to be attached to each outside back post, as indicated at A, Fig. 67, which will permit the covering of the back of the arm to be drawn through and tacked on the back, making a closed join. To better show the treatment of the back, one arm of the chair is indicated as if cut away.

The outside back is canvassed, as shown in Fig. 67, and five rows of pillow springs, three to a row, are sewn to the canvas and tied down in the regular way, but kept as high as possible in order that they may be extremely soft. A layer of canvas is then placed over the springs, drawn and tacked loosely



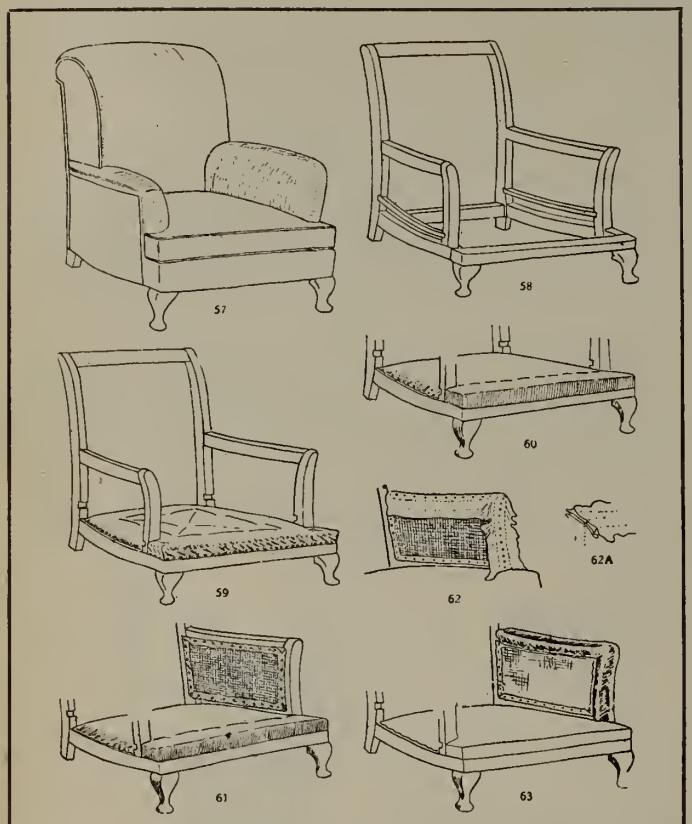
Chairs showing variation in arm construction.

and sewed to the tops of the springs, presenting the condition illustrated in Fig. 68.

The chair illustrated in Fig. 57 brings our study of down-cushioned upholstering to another stage and to a different type of chair from the one described in preceding instalments.

The frame of this chair, shown in Fig. 58, is exceedingly simple and gives little indication of the appearance it is to assume in the upholstering. For this reason we give, at the outset, a sketch of the finished chair in order that the workman may have in mind the object to be attained even in the preliminary processes which are first described.

It will be noticed first of all that the chair frame, Fig. 58, is provided with removable arm rails (see A in diagram), which greatly facilitate the upholster-



Chair with removable arm rails.

ing of the seat. All of the preliminary processes with regard to webbing, placing and tieing of springs are practically the same in connection with this chair as were described in connection with the first chair shown in this series. Reference should therefore be made for these preliminary processes to Figs. 1 to 6 of the first instalment which was included in the July issue of the "Canadian Woodworker and Furniture Manufacturer."

Following the canvassing of the springs, the subsequent processes are different and call for the use of a light, soft double-stuffing, indicated in Fig. 59. The front edge of the double-stuffing is stitched up uniformly with a slight projection beyond the frame, but is kept very soft and pliant. A very light coating of hair and wadding is placed on top of the double-stuffing and then a covering of muslin, giving the appearance shown in Fig. 60.

The arms are next in order for attention. The loose rails are nailed into place, as shown in Fig. 61. On the tops and fronts of the arms a soft, double roll is produced by tacking a piece of canvas, as shown in Figs. 62 and 62A. This is stuffed softly, as indicated in Fig. 63, and stitched after the manner of Fig. 64, taking care always to keep the edges uniform and avoiding hardness.

Floors

The Eskimo has floors of ice, and probably he thinks them nice, and strictly up-to-date; but if there ever came a thaw they'd be the worst you ever saw, and that's as sure as fate.

The Arab has his floor of sand; I have no doubt he thinks it grand, a floor beyond compare; but sand is full of bugs and ants, and they climb up a fellow's pants, when he sits in a chair.

The Mexican has floors of dirt, and floors of that sort will not hurt, so long as weather's dry; but when there comes a season wet, such floors are not the one best bet, which no one can deny.

In olden times men built their homes with battlements and towers and stones, and ornaments of gold; but all the floors were made of stone, and they made people sigh and groan, they were so hard and cold.

And then with rushes they were strewn, to make them warmer to the shoon, and also to the feet; and those stale rushes would decay; their scent would drive the folks away, in agonized retreat.

It took uncounted years of toil and planning by the midnight oil to dope out modern floors; the floors on which we dance and walk, and sing and cuss and wildly talk of hoarders and such bores.

The floors on which we spend our lives, and train our kids, and beat our wives, are surely handsome things; be they of color light or dark, we proudly view them and remark, "They're good enough for Kings."

Your mansion might have jasper walls, the finest paintings in its halls that artists can produce, and onyx stairs and marble doors, but if it had no modern floors, 'twould be a poor excuse.

Good hardwood floors make life a poem; they beautify your happy home as nothing else can do: your lumber dealer has the best; the years have given it the test that means so much to you.

Business Continues to Show Improvement

Conditions are on the mend. Not only is there a feeling of better times in the air but business is on the increase. The fact that certain commodities have increased in price during recent weeks is a most encouraging sign, especially after such a period of liquidation as has been experienced. It means that greater stability may be expected. One large mail order concern records an increase in value of orders received as compared with the same period last year. This in spite of the fact that prices have been reduced on an average of 30 per cent. Stocks in the hands of retailers are reported to be very low, with the result that they are buying more freely. The demand for furniture has shown an improvement. In the mill work industry the call for woodwork is strong. All down the line trade shows signs of gaining strength Part of this is seasonal, but some of it is due to the fact that the worst is over and that conditions are definitely on the up-grade. No extensive improvement need be anticipated before spring but in the meantime we are building a solid foundation for better times.

Successful Furniture Exhibitions in United States Centres

The furniture exhibitions held recently at Jamestown, High Point and New York, were very successful. A gratifying number of buyers were in attendance and the buying was all that was expected. Many of the manufacturers exhibiting report that they booked enough business to keep their plants operating to capacity, well on into the new year.

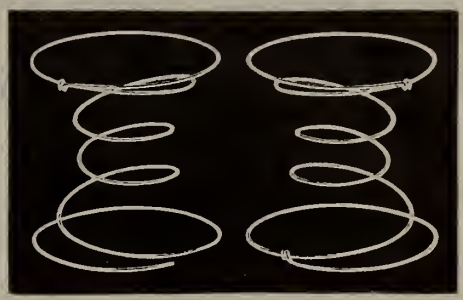
The buying might be termed spotty, in fact it was a repetition of the January and midsummer markets in that most of the business went to those manufacturers who brought out new and attractive lines and who had figured their prices down to the lowest notch. Those who refused to accept the lesson of the earlier markets and who attempted to put over their old lines, depending entirely upon small reductions to make sales, were disillusioned and were forced to see their competitors take the bulk of the business.

If, as Roger Babson has stated, those sections and industries which were hit first, will be the first to recover, the success of the eastern market augurs well for the furniture industry. The east was the first to suffer when the depression hit the country and as indicated by these markets, has shown a partial, if not complete, recovery. Taking this point of view, the January markets should prove to be an unqualified success.

Cooperage Stock Imports During 1919

The U. S. Department of Commerce Bureau of Cencus recently issued some statistics covering the production of tight and slack co-operative stock during the year 1919. Touching on exports, this report states that during the year in question the value of the staves and headings exported was greater than for any previous year. In itemizing this statement, it was found that the exports of Canada for 1919 were as follows:— 26,841,432 staves, having a value of $710,570., or an average value of $26.47 per M. staves. As far as quantity is concerned, Canada took more cooperage stock than any other countries to which this material had been exported, but in value of exports goes to the United Kingdom and to France where considerably in excess of those to Canada Canada has many large establishments devoted exclusively to the production of cooperage stock. In view of this, it is hard to see why so much cooperage material of American manufacture should be used in this country.

"IDEAL"
FURNITURE and UPHOLSTERY
SPRINGS



Double or single cone, plain or knotted ends, in any height, shape or gauge of wire.

All "Ideal" Springs are made of "Premier" Brand—the best steel spring wire obtainable. Before shipping, the springs are japanned and heat-treated, giving an enamel finish and making the spring more resilient.

How to Finish Oak

Suggestions for Securing Different Shades and Finishes—Giving old Appearances to Jacobean Finish—Details of Ebony Finish

In addition to ammonia, which is used for both fuming and staining oak, there are several stains that will produce beautiful effects on this wood. The grain of oak rises considerably when stained with a water stain, consequently it is advisable when using water stains to counteract this by first covering the wood with water and when dry easing the grain which has risen by rubbing the whole surface with fine glass paper. Coarse glass-paper and vigorous rubbing should be avoided, or the benefit of this precaution will be lessened. Jacobean oak furniture in what is termed the Jacobean style has a considerable vogue, and finishers will find the following a successful and inexpensive method of imitating the appearance of old work.

Having papered the watered oak, apply a strong solution of common soda and water. When dry, rub all over with vandyke brown and turpentine; this can be rubbed in the exposed portions of the work to give it the appearance of age. When dry give the whole a liberal coating of stiff polish, which can be rubbed flat with fine glass-paper after a few hours. A further coating of polish will be necessary to make the finish more durable, and any glaring unevenness of color can be remedied by the use of the black colour brush —a little gas or lamp black diluted with spirit may be used for this. Cover this with a further stiff coat of polish to fix the colour, and lay aside; when dry rub a little beeswax over the whole surface (two thirds beeswax to one third turpentine). Rub this briskly with a piece of rag and finish off with a good brushing with a medium stiff brush of the shoe-brush type. A word of warning may possibly be helpful at this stage. As a rule the pores of oak are not filled, consequently when "stiffing up" with polish don't attempt to choke the grain; and when waxing be sparing with the beeswax and generous with the rubbing.

For Dark Effects

The followng selection of stains will be found useful where a dark color is desired. Perhaps the simplest is strong coffee. Vandyke and water will produce a greenish brown effect. Vandyke may be obtained ground in water and then diluted with additional water till the desired strength is obtained.

Equal parts of sulphuric acid and water to which some iron filings are added will produce a dark stain, if by chance too much sulphuric acid be used, a little ammonia (.880) applied to the over-dark portion will quickly neutralize the ill-effects of the acid.

Boil 1 lb. logwood chips in a quart of water, add 1 oz. of tartaric acid and apply hot.

Permanganate of potash is another good brown stain; the purple color that shows at first quickly disappears.

Another homely dark stain suitable for either walnut or oak is the ordinary green husk of the walnut boiled in water; this can be applied either hot or cold.

A very nice effect may be obtained by applying a paste of slaked lime. This will not have so much effect on the "flower" as on the body of the wood, producing a pleasing contrast. When dry, brush off and polish in the usual manner.

Grey and Black Tones

Mix green copperas with water to the desired shade Like ammonia, the effect of this stain is dependent upon the tanic acid contents.

Iron acetate, which can be made by steeping iron filings in dilute sulphuric acid and water, will produce a very good grey.

Nigrosine is by far the blackest colouring medium extant, and like most anilines is made soluble in spirit as well as in water, so it is advisable when purchasing to state clearly what is required. Each produces a very black effect, the difference being that a spirit stain naturally dries off more quickly than water, whilst a water stain remaining fluid for a longer period is capable of more even application; this particular difference is applicable to all stains and is of greater importance where the shades are more delicate than in the instance given above.

Bog Oak Stain

An ounce of permanganate of potash in a pint of water, melt an ounce of verdigris in half a pint of vinegar, mix the whole together and apply.

A deep brown stain can be made by a solution of nigrosine and water to which is added some Bismarck brown. Whenever Bismarck brown is mentioned as a stain or as a coloring medium it will invariably be found that "a little " is mentioned and this should be taken very literally. Bismarck is a very violent color and must be treated accordingly; if a speck or two be placed on the hand and a little water or methylated spirit added its strength will soon be apparent.

Although there is very little call for green oak at the present time, it will be useful to set down the following for use should the occasion for it arise. Four ounces of verdigris in a quart of vinegar, add half an ounce of napthol green, half an ounce of indigo, a little brown stain and dilute with water to the required strength and shade.

Black Stain

This is often miscalled ebony stain and recommended for ebonising woods; why this popular misunderstanding sould be so general is inexplicable, for, as most woodworkers know, ebony may be any shade from pink to deep rifle green.

The woods used for ebonising are close in texture with scarcely any pores, as pear-tree or beech; if a hard wood is used, nigrosine will be found to be the most penetrating, a solution of, say, four ounces of

nigrosine in three quarts of hot water will give a good black stain.

For strengthening the other ingredients of black stains an iron solution is frequently used, such as an iron acetone or iron filings in acetic acid; the same result can be produced by placing a handful of rusty nails in half a pint of vinegar. Nutgalls and logwood in combination with the above iron solution are the main ingredients of almost every ebonising stain.

Boil in an iron vessel, for preference an old saucepan, two quarts of vinegar, 1 lb. of extract of logwood, quarter of a pound of green copperas, 2 ounces of china or indigo blue and one ounce of nutgalls, then add half a pint of "iron solution."

Boil two ounces of extract of logwood, 1½ oz. of copperas in 2 pints of water, apply hot, and then give several applications of iron solution.

Rub the wood with a strong solution of sulphuric acid and hold it in front of the fire, which will immediately turn it black, this is a suitable method for blacking small articles a dead dull black.

Two pounds of logwood, half a pound of copperas, four ounces of drop black, one pound of logwood extract boiled for a considerable time in two quarts of water, when cool strain off through some muslin and add an ounce of powdered nutgalls. Boil together powdered nutgalls, logwood chips and alum until the water turns black, strain off and apply warm; several applications may be needed for a deep color, then apply a coating of iron solution.

Grey Finish on Elm

While it is unquestionable that feminine fashions are suggested and stimulated by French creations, it is equally true that the varying vogues in furniture are initiated and encouraged by new and attractive woods which from time to time are placed upon the market, says a writer in the Timber Trades Journal, London. Whereas at one time choice mahogany was the furniture wood par excellence, the tremendous difference in prices and change of ideas have led to the extensive use of walnut, birch, and other timbers, each having its own characteristic merits. Now another wood is rapidly coming into favor in the form of British greywood, which is already widely in use among the large furniture manufacturers, and we have seen specifications for considerable orders to be executed in this wood, which, by the way, was displayed for the first time to great advantage at the recent Building Trades exhibition at Olympia. In fairness we should say that there is now more than one greywood upon the market, but the particular species we refer to at the moment is what is known as British greywood (patented), and as there appears to be some uncertainty as to the merits and qualities of this wood, we recently paid a visit to the works where it is being turned out on a large scale.

As those who visited the exhibition at Olympia are aware, the various manufactured articles made from Brtish greywood were exhibited to demonstrate the practical uses of this wood, which is prepared from selected English elm—a wood hitherto looked upon by most people as only fit for the commonest work, because of ts tendency to twist and shrink. By this treatment this tendency has been entirely eliminated, and there is now no reason why the wood may not be safely used in the manufacture of every form of joinery, fittings, furniture, and parquetry flooring. All that is required is the same intelligent handling necessary in the use of any other type of hardwood, and it can be confidently recommended to architects and designers as a valuable decorative wood, its remarkble neutral tint rendering it unique for practically every color scheme. The value of the wood is accentuated by the fact of its being grown in this country and entirely prepared by British labor.

Britsh greywood is an English elm treated by a special process, by which the pigmentary cells of the wood are changed from the natural light brown color to a beautiful grey tint. The wood is not dyed or stained but is naturally colored by the combined action of the inherent acids of the tree and other chemical agents scientifically applied. The tree is quartered and cut into the required thicknesses, and then treated, and is afterwards carefully dried by a process evolved during the war for drying aeronautical timber. The process does not in any way injure the wood; on the contrary, it has the advantage of preserving it and hardening its fibres, and further kills all tendency to worm. The wood is eminently suitable for parquet flooring, furniture paneling, doors, windows, in fact, anything and everything that requires a decorative feature, for, being a neutral tint, it will not clash with other colors, and makes a quiet and dignified background. To use the wood to the best advantage, in all big framings, it is advisable to build it up on a softwood core or backing. When properly clamped up it makes an exceedingly strong joint, adhering neatly to its backing. When glueing up, it is better to wet the faces of the grey wood with steam or hot water. This makes the wood more pliable and it goes down on to its bed more satisfactorily, and when thoroughly set, can be brought to a very fine finish.

Greywood makes splendid veneers and glues down remarkably well. The greywood must not be French polished; it may be left absolutely plain from the tool, or polished with white paraffin wax dissolved in turpentine with a small piece of resin to harden the polish. For finer work, white or colorless polish must be used. It maintains its color, and neither fades nor turns yellow and in cost is comparable to ordinary foreign hardwoods.

Toy Exports on Decline

A few German toys are arriving in Canada for the Christmas trade. What is said to be the first cargo of German merchandise of any considerable size arrived at Montreal recently. Although German toy manufacturers are attempting to secure the world markets few firms are trying to sell in Canada. This is due to the Customs regulations which went into force early last year, by which the Customs duty on goods imported from Germany is based at 50% of the pre-war rate of the market. This works to the disadvantage of the German manufacturer as a purchase of goods costing $75.00 in Canadian money, the Customs duty might amount to something like $40.00.

Japanese toys are not as plentiful as in recent years. Owing to the high cost of living which prevails in Japan, the Japanese toy manufacturers have not been able to manufacture them as cheaply as formerly, and are thus prohibited from flooding the outside markets with their cheap toys.

This gives the Canadian toy manufacturer a better chance than ever before to secure and hold our own markets against outside competition.

Italian Renaissance Finish

Under the title "The Origin of Polychrome" the October "Canadian Woodworker and Furniture Manufacturer" ran an item which contained a reference to Italian Renaissance as well as to Polychrome. These two finishes do not resemble each other in the slightest being entirely different. Polychrome as the word implies means the reproduction of many colors. In a true polychrome these colors are subdued and dimmed until they have that dusty look which characterizes ancient carvings as they appear to us after having been exposed to the elements for many centuries.

The Italian Renaissance finish on walnut or oak is not a polychrome in any sense of the word. An attractive Italian Renaissance finish may be secured as follows:

Sand wood smooth. Stain with following formula:
Nigrosine Green Black ..... 1 Oz.
Warm Water ..... 1 Gal.

Where sap streaks exist in wood, add ¼ oz. Crystal Sulphate of Iron to above formula. Dry thoroughly after applying stain, sand lightly.

Apply coat of 40 to 60 per cent mixture of wood lacquer dry; about four hours (sand smooth).

Rub in a coat of Wax to which dry Zinc White has been added (3 parts of Wax to 1 part Zinc.) Relieve excess wax with a soft piece of cloth, to desired tone.

Standard Definitions for Case Goods

The National Alliance of Case Goods Associations recently adopted definitions to apply to the buying and selling of case goods. This is in line with a similar move on the part of the National Council of Furniture Associations

SOLID

Bed room or dining room Furniture designated as "solid" shall have all exteriors, except case back, case bottom and mirror back, of solid wood of the kind designated.

The interior of the case may be constructed of such woods as the manufacturer may consider most suitable for the purpose.

GENUINE

Bed room or dining room furniture designated as "genuine" shall have all exterior case back, case bottom and mirror back, of the kind of wood designated. The tops, fronts and ends may be plywood.

The interior of the case may be constructed of such woods as the manufacturer may consider most suitable for the purpose.

COMBINATION

Bed room or dining room furniture designated as "combination" shall have the tops, drawers, fronts or doors and ends of plywood or solid wood of the kind designated. The remainder of the case to be constructed of such woods the manufacturer may consider most suitable for the purpose.

SUBSTITUTE

When the word "finish" is used in connection with the name of a wood, such as Walnut Finish, Mahogany Finish, Oak Finish, etc., in describing bed room or dining room furniture, it may be applied to furniture made of any woods considered by the manufacturer as most suitable for the purpose.

All Imported Joinery Must be Union Made

Further steps are being taken by British labor unions to force their will on Canadian manufacturers. They call it, however, "foiling the dumper," says a recent cable despatch. An agreement has been arrived at between the unions concerned with the building trades to ensure that all imported joinery has been made in union shops. Such goods must bear the union label or British woodworkers will refuse to handle them.

"The dumping of goods manufactured under conditions which do not appeal to us as union men has been going on by the United States and British Columbia, especially with regard to house doors," said the secretary of the woodworkers' society, London. "The employers and ourselves have taken this step entirely on our own, and it is the first action of the kind to be taken by an industry in any country."

This is not the first time, however, that international action has been considered by British labor with regard to Canada. After the Winnipeg labor troubles two Canadian unionists arrived in London with the avowed intention of securing the release of the convicted strikers by influencing the British transport workers to refuse to handle Canadian imports. Their mission did not succeed.

Are Millwork Prices Too High?

Why is it that the home builder always expects cheap woodwork? He is willing to pay a fair price for almost every other item entering into a house, but when it comes to the woodwork, especially if a high-class job is required, he usually balks at the price.

Commenting on this phase of the millwork business, a prominent woodworker stated that recently he was approached by a prospect who had considerable means, and asked to quote on some built-in fixtures for his new home. This home-builder had his quotations on lumber, heating and all other work. When buying the hardware, two different styles and finishes were shown, the difference in price being in the neighborhood of $225.00, and the high price line was purchased without a murmur. When the cost of the millwork was submitted to him, he went straight up in the air. All the other items which went into his house had met with his approval,—high-priced hardware, costly face brick, lighting fixtures, plumbing fixtures, etc., yet when the millman quoted a fair price, in fact a competitive price, the customer thought he was being robbed.

Does this not suggest that the millwork industry either individually or collectively, should take steps to educate the public to the fact that millwork prices are too low, if anything, and to the value and satisfaction to be derived from having high-class woodwork in the home.

It is an advantage to have the lower wheel of the band saw heavier than the top one, as it checks the tendency of the top from overrunning the lower one when the speed slackens.

The man who works a modern planer should remember as he draws out the bottom cutter block that his father had to crawl under the machine to set or to sharpen the cutters.

Nichols Varnish Drying Equipment

A complete unit of fan, motor, heaters, air compressor, with automatic temperature and humidity controls for the correct drying of all coatings on the finest pianos, talking machine cabinets, furniture, automobiles, etc. A new humidifying air washer, which eliminates all dust and dirt, does away with all spray heads and connecting piping.

Will triple the output of your finishing rooms; decrease the congestion in your factory; reduce investment of goods in process and improve working conditions for your employees.

Better finish, scientifically dried from the inside out.

We will analyze conditions in your plant and submit a proposition covering an equipment suitable for your requirements, whether it be for automobiles, talking machines, pianos, furniture or railroad cars.

We have exclusive authority to issue license to use the Grosvenor Process Patent in all territory East of the Mississippi, Ohio and Detroit Rivers in the United States and Canada, the only varnish drying process that simultaneously subjects the coatings to the action of moisture in excess of natural humidity.

We also manufacture the Nichols Lumber Dryers, Veneer Dryers and Hydraulic Pumps. It will pay you to address us for further particulars.

Increasing speed and reducing costs while making certain highest quality work, in your finishing room with the

DeVilbiss
Spray-painting System

Whether you manufacture phonograph cabinets or chairs, metal cabinets or brass beds; whether you varnish, enamel or lacquer those products, one DeVilbiss spray operator will do 4 or 5 times as much work as a brush finisher in the same time.

On every class and grade of work the sprayed-coating will be of highest, uniform quality—free from brush marks, runs, fatty edges and like faults.

DeVilbiss exhausting equipment will insure a clean, healthful place in which to work, and reduce the fire hazard.

The outfit will be on the job every day, and cost little to operate and keep up.

These savings and advantages can be had in your finishing room, in the same profitable degree they are now enjoyed in thousands of wood and metal-working plants of every kind.

Let us mail you furthur particulars that meet your individual requirements

Getting Results In Veneer Room

Straightening and Drying Small Lots—Overcoming Split Ends—How Good Joints are Made

By H. Graham

In a plant where the quantity of veneer to be dried is not great enough to warrant installing a redrier a common practise is to dry the veneer between hot cauls, first wetting it thoroughly so that it will be perfectly flat and easy to work with when it is removed. The best cauls the writer ever saw for this work were made of basswood. This wood, being of a very absorbent nature, takes up the moisture from the veneer, and then when put in the caul heater to be reheated the moisture is removed without the cauls splitting or suffering in any way. No other wood that I have seen used will stand up under the constant wetting and drying for any length of time, but basswood has all the characteristics of a blotter.

There are several practical ways of wetting the veneer. A sponge and pail may be used but that is rather a slow method. In the veneer room where the writer works we have a fairly large sink, of the kitchen variety, and we just put a stopper in it and fill it full of water. The veneer is then dipped in, in bunches, that is if it is short stock such as is used for butt joint work, and then stood on end for a short time to allow the surplus water to drain off. If it is long stock we take a few sheets together and pass it through the water the same as one does when developing a strip of films in a tray. The only long stock we put through the wetting process is stock that has to be jointed. Practically all of the short stock has to be jointed so we have to wet all of it, unless we get a log that is flat enough to be worked without wetting, which seldom occurs.

Too much Weight Harmful

The wet pieces of veneer are put between the cauls about three pieces between each two cauls being the proper number for the best results. The cauls are placed on a pair of trestles and stacked up until all the veneer is taken care of. Then a weight is placed on top to press down the veneer. It is in weighting the veneer down that a great many fellows fall down. They insist on putting too much weight on it, with the result that the veneer splits at the ends. When the veneer is well wetted very little weight is required to hold it flat. The weight of the cauls on top is sufficient to straighten out the bottom pieces and then all that is required is sufficient weight to hold down the top pieces. Great care should be taken in applying weight because if the veneer splits at the ends it requires some skill to fix it and with all the skill that may be applied the patching will still be noticeable to a practised eye.

I have seen some men wet their veneer and put it between hot cauls in a screw press, working on the theory, no doubt, that if they screwed it down tight enough it couldn't split. Then when the veneer did split at the ends they put the next lot in the press and tightened it down still tighter to overcome the splitting. A few moments thought is all that is necessary to show anybody that when veneer is wet and put between hot cauls it has to shrink. Therefore, if it is weighted down so it cannot shrink there is only one thing left for it to do, namely, split. The idea of wetting it well before drying, of course, is to make it pliable. And if it is handled properly after it has been wet it will come out as flat as a sheet of cardboard, and perfectly dry. In this condition it is a pleasure to work with it.

Of course, there are some very contrary logs of veneer, particularly the short walnut made from stumps, which is end jointed, or butt-jointed as it is usually called, and it is almost impossible to avoid splitting some of it once in a while. The real purpose of this article is to tell how the writer was able

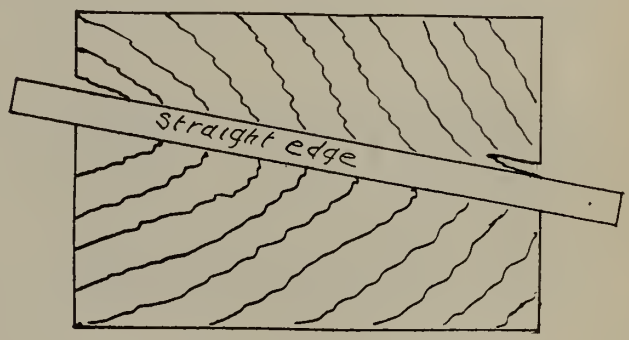

Fig. 1.

Showing how splits are cut out

to repair some of this veneer with split ends, if not so that it could not be detected, at least so that it made a very presentable job, and one that passed inspection. The sketch presented herewith will help to convey the idea.

The veneer usually splits for a distance of about four inches in from the ends, sometimes only at one end, more often at both ends. It is seldom that these splits come in line with each other. In width they are generally about one-eighth inch or three-sixteenth at the end, to nothing. We lay a straight edge from one split to the other and cut the veneer on this line. Then we place several pieces on a shooting board and joint them, taking care to joint the proper edges and taking off just sufficient to make a joint. Then we tack the veneer on boards and tape the joints. Thus we have the stock as it was, with the split removed. It differs only in that about one-eighth inch or three-sixteenths has been removed, and this is not sufficient, as a rule, to alter the figure very much or to mar the appearance of the veneer.

If there is plenty of the veneer available it would

not pay to bother patching, but that is just where the difficulty comes in, because nearly always when a short log such as I have described is cut up, it is all cut at the same time, and therefore, if any of it is split it must be fixed as it is almost an impossibility to find one figured walnut log that will match another. The writer has repaired split stock many times in the manner described and never yet got hauled on the carpet for it. Very often the joints came right on the front of a piano, and if they "got by" there, they should pass almost anywhere.

When Split Is at One End

Sometimes the veneer is split only on one end. If this is the case you can cut the piece of veneer through to the other end and keep the joint straight with the grain. This will make it a little less conspicuous than where than where the joint has to be made diagonally on account of two splits not coming in line. Sometimes if the veneer happens to be very brittle, and the writer has had it occur a number of

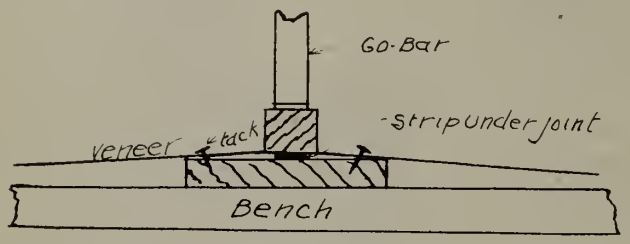

Fig. 2.

One way of makiug a good joint

times, particularly if the stock was wide, there would be as many as two, and sometimes even three, checks in each end of some of the pieces. In a case of this kind it is necessary to make two or three joints, but they can all be made at once if the pieces are numbered so they will not get mixed up.

The knowledge that checked stock can be repaired so it will pass inspection should not lead the veneer man to lessen the care he gives to his stock, because it is a slow and rather tedious job doing the repairing, and if you have to put down on your time card the length of time you have been on the job it shows up against you in the office. On the other hand there is a great deal of satisfaction in knowing that no matter what accident happens you are capable of taking care of it in a creditable manner.

Making Satisfactory Joint

To make a perfect butt joint requires a great deal of care, and they must be perfectly made if they are going to pass inspection. If they are to be made on a machine it is necessary to put a piece of thin maple, say one eighth inch stock, or something of this kind, each side of the veneer to be jointed to keep the end grain from being torn out. To make them on a shooting board with a hand plane, the plane must be absolutely as sharp as a razor and the joint must be made to conform perfectly to a straight edge.

The best butt joints I ever saw made were the work of an old mechanic that had charge of our veneer room when I started to work in it years ago. Time was, of course, no object to him and he plodded along in his own way, but he certainly could make joints and it may be of interest to readers of the "Canadian Woodworker" if I describe his system.

The way we do them is simply to make the joint and tack the two pieces of veneer on a board in the usual manner and then tape the joint. But my old friend "Jim" would have considered it an outrage to treat a butt joint in that manner. His method is illustrated at Fig. 2. Jim also jointed his veneer on a shooting board, very carefully, but it was in our methods of taping the joint that we differed so radically. He used to place a maple block about six inches wide on the bench and tack his two pieces of veneer onto it, but, before doing so he inserted a thin strip of wood about an inch wide and one eighth inch thick and as long as the veneer was wide directly under the joint. He placed the tacks about two inches from the joint. His next move was to glue the joint very carefully and then apply the paper tape. He then placed another block on top of the joint and pressed it down with "go-bars" extended up to the ceiling. Then when he had these in place he would pull out the thin strip which had been inserted under the joint. Jim claimed that it was next to impossible to get a good close joint just by shoving one piece of veneer up against the other by hand. His contention was that by first inserting the thin strip under the joint and then placing the veneer together by hand and removing the strip afterwards it was possible to force the veneer together and make a joint because the two pieces could not spread on account of the tacks.

Handling Cause of Poor Joints

Personally, I don't think he gained anything by inserting his strip because I do not think the tacks would hold the veneer from going back a shade when the strip was removed. However, Jim certainly turned out joints that could not be criticised and it may be that there was something in his method. I pass the information on for what it is worth. My own opinion is that a great deal of the trouble caused by joints opening up slightly before they are laid on the core stock is due to carelessness in handling the veneer. I contend that veneer that has been butt jointed should be placed flat on a board as soon as it is taped and it should remain there until it is laid on the cores. Instead of that one often sees it handled very carelessly, the joint being opened up, using the tape for a hinge. That is why I think Jim's success was due more to his careful handling of the veneer after it was jointed than to his method of taping.

I never worked in a plant where they had a redrier but I have seen them in operation and they look to me like an ideal piece of equipment. It seems to me they would eliminate all the trouble of wetting veneer and then they would not split the ends, thus making patching unnecessary. As I say they are undoubtedly a fine machine and any plant that has enough veneer to dry to keep one in operation, even half the time, should, in my judgment, have one. In our plant, however, we would not have enough work to keep one operating more than about one day a week and I think there must be some other concerns similarly fixed. It is for them I have contributed some of the methods I have found to work successfully in actual practice on butt joint stock, and with the exception of crotch mahogany I think it is the most difficult stock to handle that finds its way to the veneer room.

Some cotton belts would make good weather gauges. They lengthen in dry weather, and become tight in dry.

THE solid success which has attended this company's half century of business is attributable to its having established high ideals through direct personal contact with its customers. During the current period of transition, many buyers may have difficulty in establishing satisfactory supply connections for strictly high-grade hardwood lumber and veneers. May we suggest that through personal contact we are confident of our ability to demonstrate that our selection of genuine northern grown oak, walnut, maple, ash and other major species, and our rotary cut poplar, is sufficiently varied to prove a genuine asset to any discriminating buyer, and that this concededly superior product is just as good to day as was the original stock manufactured on the same site fifty or more years ago. Surely it will pay you to know us better.

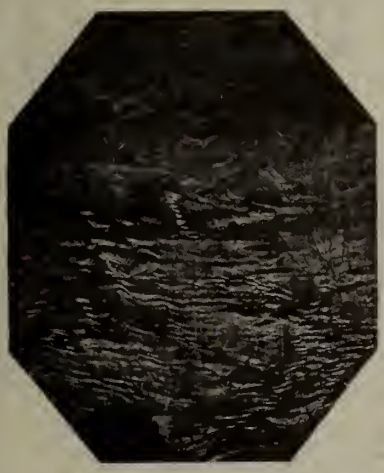
The Bachman Plant —and the Bachman Product



A sample of beautifully figured Walnut Stump Wood

Here, in this large and fully equipped plant, Bachman quality veneers are made. Our extensive yards are piled high with carefully selected, choice Indiana White Oak, Walnut and Gum.

Bachman veneers are cut full thickness, which means plenty of wood for sanding and a minimum of breakage in handling.

Bachman's forty years' experience in hardwood sawing is evidenced in every piece of veneer that leaves the plant. The sawed stock can scarcely be told from the sliced.

These are a few of the reasons why our customers tell us they get *fifty per cent. more panelling out of Bachman veneers* than they can from average veneers.

It is this unchanging high standard, both as regards materials and workmanship, that has made possible forty years of successful business. It is your assurance of the utmost in quality and service.

No order is too small to receive our prompt and careful attention—none too large to be handled to your entire satisfaction.

Time and Temperature in Redrying

Within Certain Limits Higher Temperatures Shorten Drying Time—High Temperatures not Advisable—All Veneers Should be Redried

By ED. HUXLEY

One bit of philosophy that may be applied to redrying, perhaps even more positively than to original drying, is that we can shorten the time by using higher temperature. But this raises an interesting question of probable harm resulting through efforts to cut down the time of redrying through using it. There is some evidence coming forward that high temperature in drying may work harm to veneer, especially if it has not been pretty thoroughly dried, or, we might say, properly dried, before it comes to the redrier. If caretul experiments show that high temperature in redrying to save time damages the wood, then it is time to call a halt on it, and if necessary use more time, so that we may be sure of good results.

Drying of wood, whether it is primary drying or redrying, consists essentially in removing moisture. This, the experts say, involves first the drawing out of free moisture, and second, in removing the moisture wedged in, so to speak, in each void of the wood or among the fibers of the wood. The agencies for accomplishing this are heat and ventilation, or air movement.

High Temperature Dangerous

Experience in both drying and redrying brings evidence that there is a limit to temperature, but mean time there is a wide range of possible differences. The temperature in lumber drying ranges from 100 to above 200 deg. Fahr.., and some times a fairly wide range is used in drying the lumber, being varied during the different stages of the process of drying. Other variations are necessary because of difference in the character of the timber, it being necessary to use more time and less temperature on some close-knit timber, and so it goes. When it comes to redrying we have a condition somewhat different from primary drying, because presumably the stock has been dried once, and not only relieved of what is termed free moisture, but also part of the other moisture. In short, the redrying is simply to give the final touches, and perhaps because of this, we sometimes grow careless and fail to realize that it should be handled with the same care exercised in primary drying.

There enters incidentally the question of practicality of making the redrier serve as as a primary drier—that is, to take stock which has not been properly dried and put it in shape for use. This seems to be a matter to consider separately, yet there are times when it will intrude itself even in the plant where the main call for the redrier is to complete the drying on stock which has once been fairly dried.

I recall, in this connection, some practices with the old-time hot-plate driers, which evidently led to the modern redrier. We had a series of hot plates suspended in a frame, with levers and toggles to open and close them, and these were piped with steam. That is, they were hollow plates, made smooth on each side and with a steam cavity through which to do the heating. We only carried a nominal pressure on these; in fact, it was not pressure that was sought, but merely the temperature of the steam, and reducing valves were used, which kept it down to a very few pounds. The 40 to 75 lbs. spoken of to-day, used in hot-plate redriers, would probably have exploded every plate in the old-time hot press.

Material Can Be Dried in This Way

We used these hot plates primarily for flattening out and redrying thin veneer for plywood, which had been dried in the kilns and air, and in many instances had wrinkled. It was given a final drying out between the hot plates just prior to going into the glue room. Now and then we varied this, however. There would come a hurry order, and there are cases on record where we pulled the blocks into the plant in the morning, cut them into veneer, dried the fresh, wet veneer in these hot-plate presses, sent it to the glue room, glued it into plywood panels, trimmed the panels and had them uptown inside of forty-eight hours, and sometimes even short of that.

Admittedly, that was not good practice, and it would be justly frowned on to-day, but so far as the work of drying is concerned the hot plates seemed to have performed their duty nobly. We were able by the use of them to dry veneer in a matter of a few minutes, or a half hour at the outside, which ordinarily would have taken a night in the kilns or along period of time in the warehouse. This would seem to demonstrate that it is practical to take the same equipment that is primarily designed for redrying and make it do the primary drying of stock. It is not advisable to do this, because there are other drying methods which are more economical and satisfactory, but in an emergency it should be practical.

What seems to be the point needing the most thoughtful attention now, in connection with hot-plate redrying, is that of the amount of temperature. If too much steam pressure does damage to the wood it is time for us to be carefully experimenting and charting this matter of temperature so that we may understand positively how much to use on a given kind of wood under any given condition.—"Veneers," Indianapolis.

MAPLE PIANO PIN BLOCK STOCK

Years of Experience Behind Our Products

The Munising Woodenware Co.
MUNISING, MICH.

EARLY 1922 will require the unusual in lumber deliveries. No service can then be more helpful than our 500,000 feet capacity, specially designed dry kilns. Frequent scientific tests on many millions of feet already dried show without exception absolutely correct results. Splendid transit arrangements make these kilns available to all markets. With this service we offer our famous lumber and veneers, the lumber in plain and quartered white oak, walnut and the other hardwoods; the veneer in quarter sawed white oak, sliced and rotary cut walnut, rotary cut yellow poplar crossbanding.

WOOD-MOSAIC COMPANY
LOUISVILLE INCORPORATED KENTUCKY

New Machinery Organization Formed

The Garlock Machinery Limited, were incorporated recently to take over the assets and organization of the Garlock-Walker Machinery Co., now in liquidation. The assets of the Garlock-Walker Machinery Co. were purchased on the basis of 100 cents on the dollar to all creditors, a certain amount of time being allowed, the Garlock Machinery Limited to realize on some of the stock. The main reason for the downfall of the older organization was dissension among the principals.

Mr. Garlock has a wide connection in the woodworking field and has a well-founded grasp of the requirements of this industry. He has been selling woodworking equipment since 1906 and since 1913 his efforts have been confined entirely to the Canadian field.

Included among the directors of Garlock Machinery Limited are G. W. Boake, of the Boake Mfg. Co., and T. H. Hancock of T. H. Hancock, Limited, Toronto.

Hints on Brazing Band Saws

Cut the saw behind a tooth and at right angles to the back. Do not allow the joint to be any longer than, say, 9/16 in., and do not grind the lap down too thin. See that the saw is jointed so that it will follow on to the wheels, not to meet them. Clean the laps with emery-cloth, then finally with muriatic acid. Use flat strip solder a shade wider than the lap, this also being cleaned and rubbed with acid.

The correct heat to employ in brazing is not too bright a cherry-red, and use a solution of borax as a flux, letting this be as fresh as possible. Wipe off any surplus borax on the joint with a piece of clean paper. Do not be too prodigal with the flux, as an over-indulgence in this direction is often responsible for a soft joint. The brazing irons should not be above ¾ in. thick.

After the joint is made, and the saw cooled down to a black heat, pour ordinary lubricating oil over it, clean off with sawdust, and then smooth up with emery-cloth. If it is desired to further draw its temper, lift the joint clear, and pass under it a piece of flat iron made red-hot, and watch until the saw shows a uniform dark straw colour; then at once remove the source of heat.

Finally, take out of the saw all lumps or twists, straighten it out, correct the tension and back, and smooth up lengthwise with a fine file and emery cloth.

Boosting Your Own Product

An example of reciprocity between the accounting and sales department of a woodworking organization was encountered recently. The accounting department of this plant encloses a small printed slip with every cheque they send out in payment for goods. This slip reads as follows:—

Your Attention, Please.

This cheque pays for goods purchased of you. We manufacture doors, sash, moulding and general woodwork. Anytime you require any of these products let us have your inquiries. Please pass this slip to your purchasing agent.

While it is not possible to check up any direct results from this idea, yet those behind it feel sure that they are benefiting indirectly at least, by the use of this slip and at a very small cost.

Care in Pouring Babbitt

In pouring hot babbitt on to cold metal or wet surfaces, there is always danger of the hot metal spitting and flying in all direction and thereby causing painful and at times serious burns. The same holds true if anything cold is dropped into a pot of molten metal. It is, therefore, wise to warm and dry both the journal and shaft before attempting to pour the babbitt. If a ladle is used, it should be warmed slightly before being dipped into the hot metal. These simple "safety" precautions may be the means of preventing a "spit" which might have serious results.

Calculating Linear Speed of Saws

A correspondent, writing from Norwich. asks us to inform him how to calculate saw speed in linear feet per minute when the revolutions of the saw spindle are known. Also what is a good general speed for circular saws.

This is not a very difficult matter. First ascertain the circumference of a saw from its diameter, this being done by multiplying the diameter of the saw in inches by 3.14, or the fraction 22/7. This multiplied by the revolutions per minute and divided by 12 gives the answer in linear feet.

Thus, by way of example, suppose that we desire to know the linear speed in feet per minute of a saw 40 in. in diameter, running at 980 revs. per minute. Then—

$$40 \times 3.14 \times 980 \div 12 = 10{,}257.$$

It is generally assumed that a periphery or rim speed of 10,000 ft. per minute will suit most saws, taking the class of timber as it usually runs in a general woodworking shop.

The following table showing the revolutions per minute required to be reached with saws of various diameters in order to give a uniform peripheral speed of 10,000 ft. per minute, might be of some assistance to our correspondent as well as to other readers:—

Diameter of Saw.	Revs. per Minute.
12 in.	3,260
16 "	2,450
20 "	1,960
24 "	1,630
28 "	1,400
32 "	1,225
36 "	1,080
40 "	980
44 "	890
48 "	815
52 "	750
56 "	700
60 "	640
64 "	600
68 "	560
72 "	530

This table allows a small percentage of slip, which in a general way is inevitable. Thus actual calculations would give, as our example shows, a speed of 10,257 ft. per minute for a 40 in. diameter saw running at 980 revs., whereas actually, taking into account the slip of the belt, a speed of no more than 10,000 ft. per minute might be reached.

A sectional chip breaker on a planer is a great help in working up small work.

We are prepared to quote attractive prices on the above, and if required, can kiln-dry and dress any of this to your order.

We are prepared to quote on anything in Hardwoods for shipment direct from the mills in car lots, and solicit your inquiries. We are cutting Gum, Chestnut, Walnut and Mexican Mahogany, and have dry stocks at Jackson, Tenn. and Indianapolis, Ind.

The Lumber Market

Domestic Woods

The hardwood lumber market is at the present time seasonably quiet as December is usually a month when purchasing falls off except in such consignments as are required for immediate consumption. Woodworking establishments generally defer buying until the first or second month in the new year when they are able to gauge prospective conditions. It is also the general practice to have as low a stock as possible at the end of the year in order to make as good an inventory showing as possible. During the next two or three weeks most plants will be busy stock-taking and getting ready for the activity expected during 1922.

The outlook is considered more promising as each week goes by and this is reflected in the fact that considerable blocks of stock are changing hands, one leading wholesaler purchasing over two million feet of birch (No. 2 common and better) during the past fortnight. Another dealer purchased over a million feet and several smaller sales have taken place. This shows that the wholesale trade is gaining confidence so far as the future is concerned, and, after a long period of hesitation, things are beginning to move in the right direction. Several hardwood firms, who have a considerable quantity of 1sts and 2nds and selects and No. 1 Common on hand, are holding on to their stock unless they get the price asked. They are certain that there will be no decrease while every tendency is in the opposite direction.

With anything like normal buying, it is predicted there will be a shortage in both domestic and imported hardwoods, and particularly so, in view of the decreased operations of the past season and the limited logging activities of this. Whether the demand will get back to normal within the next few months, it is difficult to tell, but certain it is, that requisitions are coming in from all sides, asking for bids on various quantities and grades. The buyers are interested and are not disposed to call quotations into question as much as they were a few months ago.

While 1922 may not be a record year in either woodworking or lumbering, it is felt that the progress from this on will be satisfactory, and if production and prices can be stabilized, more comfortable feeling will develop. Housing commissions, large contractors and others are planning to undertake home building on an extensive scale during 1922, believing that prices have struck bottom and construction operations can be carried on now with a reasonable outlay. This, in itself, is a hopeful sign. As the season advances, indications are that industrial activity, now showing every evidence of improving, will further increase and will help to make 1922 a year marked by a larger trade, better prices, continuity of production and quicker turn-over than was manifested during the period now drawing to a close.

Imported Woods

The consensus of opinion is that the present is a good time in which to buy lumber. Not only is there the possibility and even probability of prices going still higher but shipments to-day are in excess of production which means only one thing, lower stocks. Those closest in touch with the situation predict that lumber will be a scarce item practically all next year and that prices higher than those which hold to-day are assured. By entering the market to-day the wood user is sure of a better assortment, though the majority of the holdings in the hands of lumber manufacturers are badly broken, from which to make his choice and will have the satisfaction of buying at a comparatively low price. The National Lumber Trade Barometer, published by the National Lumber Manufacturers' Association shows that during September orders were 79 per cent of normal while for the same month production was only 71 per cent of normal. This is taken to indicate that buying is increasing more rapidly than production. Since last month's report there have not been any marked changes. A state of equilibrium seems to have been reached for which no new gains have been recored by the upper grades, yet the advances which occurred some weeks ago are being held. The lower grades have responded to the impetus which recently strengthened the upper items, with the result that certain of the cheaper lines have advanced in price. As it will be some time before any increase in production which is taking or may take place, can effect the market, it is believed that present values will be held during the holiday lull and that any changes which occur will be upward.

Memphis, Tenn., Values are holding firm in this centre, though the demand is a trifle spotty. This is due, partially at least, to the fact that export buyers have withdrawn from the market. It may be that some buyers are holding back in the belief that prices will recede again. This view is not held by those in a position to judge. It is thought that higher prices will be the order of the day. The furniture industry is particularly active and is taking considerable quantities No. 1. C. & B., gum and oak, together with some No. 2.C. Strenuous efforts are being made by many manufacturers to increase production but conditions in the woods, heavy rainfall, are proving a decided handicap.

Louisville, Ky., Demand continues active with a tendency toward still higher prices. Production higher but still below demand. Practically all woods are active. Walnut in good demand. Low grade stocks are commencing to move. Any holiday lull which may occur will not affect the market for it will merely enable the producers to sort up their stocks.

Buffalo, N. Y., Trade in the Buffalo market is very satisfactory. This is the consensus of reports received. Prices have advanced as high as $20.00 on certain items. A survey of this district does not indicate any large accumulations of stock. Here as in other centres values are expected to advance still more before spring The furniture manufacturers are doing considerable buying as well as other wood-using industries.

Unionism up-to-date

"What are you doin' of, James?"

"Sharpenin' a bit o' pencil."

"You'll 'ave the union after you, me lad.
That's a carpenter's job."

The war was not won by retreating; neither can busines be secured by retrenching.

Co., with a capital stock or $40,000., to manufacture and deal in toys. The headquarters are in Toronto. Among the incorporators are Joseph Horchover, Samuel G. Cregeen and Peter Rudick.

George Walton recently passed away at his home at Belleville, Ont. Mr. Walton was a well-known woodworker, having conducted a sash, door and general woodworking factory for a number of years. He retired from active business three years ago.

The Patrucci Freres, Limited, Montreal, were recently incorporated with wide powers, among others to manufacture and deal in picture frames and church furnishings; capital $149,000. A. Mathieu and A. Viau, of Montreal, are two of the incorporators.

Elliot & Elliot, Windsor, Ont., were recently organized to handle lumber and wood products of various kinds chiefly B. C. forest products. This firm has been appointed to act as eastern representatives for the Pacific Box Co., Limited, Vancouver, B. C.

F. E. Hollingsworth, Sault Ste. Marie, Ont., has bought out the interests of his partner, T. A. Corrigan, of the Corrigan Lumber & Mill Co., Sault Ste. Marie, Ont. His firm had worked-up a successful business in the planning mill and sash and door line.

The Victorian Case Co., Limited, Toronto, was recently incorporated to manufacture and deal in furniture and to handle merchandise of all kinds; capital $40,000. N. Phillips and M. B. McPherson, barristers, Toronto, are two of the incorporators.

The British Chair, Seat & Panel Engraving Co., is considering establishing a plant at North Bay. This change is being contemplated owing to the high price of hardwoods in England and to the fact that they would like to be near the source of supply.

The planing mill operated at Newmarket, Ont., by W. H. Eves was recently damaged to the extent of $3,000. by fire. The blaze started in the machine shop and was not discovered until it had gained considerable headway. Much of the damage incurred was caused by water.

The plant of the Chestnut Canoe Company, Limited, Fredericton, N. B., was completely detroyed by fire recently. The loss includes all the equipment, models and material together with 300 completed canoes, and runs about $75,000. The insurance carried was only $20,000.

The Canadian Billiard Table & Supply Co., Ltd., Toronto, have been incorporated to manufacture and deal in billiard tables, bowling alleys, refrigerators, phonographs and store and office fixtures; capital $25,000. J. S. Lovell and C. D. Magee, of Toronto, are among the incorporators.

The Mayfair Company, Limited, Toronto, was recently granted a provincial charter to manufacture and deal in phonographs, pianos, organs and other musical instruments. Capital $40,000. Two of the incorporators are W. A. Henderson, and W. N. Irwin, barristers, both of Toronto.

Thomas B. Dowsley, one of the oldest residents of Owen Sound, Ont., died at his home recently at the age of 87 years. The deceased was a well-known carriage manufacturer starting in 1854. He invented the Dowsley carriage spring, and for fourteen years was president of the Dowsley Spring Axle Company, of Chatham, Ont.

Rice Lake Canoe Co., Limited, Cobourg, Ont., which is associated with Langslow, Ltd., have about completed a new addition to their plant. Among the equipment to be installed is the following C . M. C. machines: Revolving bed sander, 26" double surfacer, swing saw, variety saw, belt sander, chain saw mortiser and straight edging and jointing saw.

The Parker Motor Car Company, Limited, Montreal, was recently organized. Sir William Price and Sir Alexander Bertram and certain Canadian financial interests have put up $500,000, to start the company. It is expected that a Canadian car will be put on the market which will be the equal of any of the medium-priced cars of United States manufacture.

The North American Furniture Co., Limited, Owen Sound, Ont., are issuing an attractive house organ in the shape of an eight-page booklet called "The Furniture Future." This pamphlet contains a number of sales ideas and suggestions which should be of real benefit to retail furniture dealers as well as illustrating and describing some of the North American line.

The Cost Accounting Department of the Furniture Manufacturers' Association, Woodstock, Ont., which has been in charge of James E. Ferguson, has been moved to Toronto, and will henceforth be located in the same suite of offices as the Association itself. Mr. Ferguson, who will continue to direct the affairs of this company, will make his headquarters in Toronto.

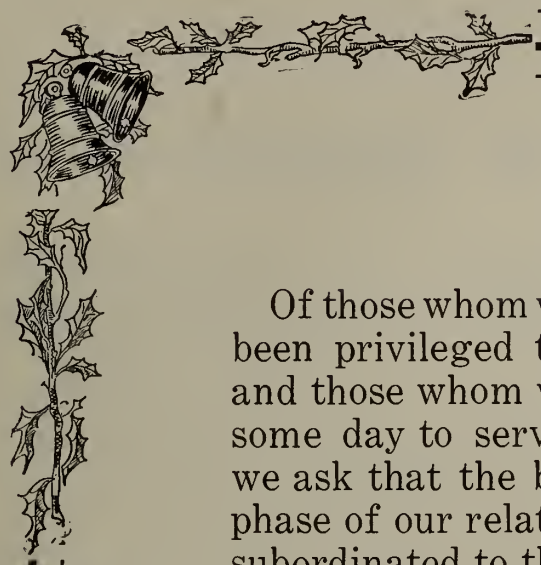
A. R. Duff, an engineer associated with the Research Department of the University of Toronto, is now available to visit furniture factories in connection with dry kilning or other troubles which come within the scope of the trained engineer. Mr. Duff has called on several furniture men and has assisted them in overcoming certain difficulties with which they were contending.

The Toronto Housing Co., Limited, Toronto, Ont., have decided to inaugurate an extensive building campaign. Starting early in the spring they propose erecting as large a number of apartment houses as they can handle. They figure that while building costs are high, yet they are about as low as they will go for some time and that owing to the shortage of homes, the erection of apartment houses is particularly profitable at the present time.

Frank Stanley, piano manufacturer, Toronto, has purchased the entire assets of the Cecilian Piano Co., Toronto, including factory on Niagara St. This is one of the largest deals which has taken place in the piano industry in recent years, as the assets of the Cecilian Company represent some $200,000. It also seems to indicate that the future of the piano industry is viewed in a very favorable light by those in closest touch with the musical instrument field.

The Regina Sash & Door Factory, Regina, Sask., have been refused permission by the city council to erect a new plant on a site owned by the company at Athol & South Railway Sts. This was in deference to protests from ratepayers who claimed that the presence of a factory in this district would lower property values. A new site is under contemplation and if negotiations are successful, the new plant of the Regina Sash & Door Factory may be located in Block 318 immediately south of the C. P. R. tracks.

The Jones Products Co., Limited, have been granted a provincial charter to operate a box factory, manufacture toys, sash, frames, doors, columns and all such things used in the building trads. Other powers conferred upon the company are to manufac-



Of those whom we have been privileged to serve and those whom we hope some day to serve, may we ask that the business phase of our relations be subordinated to the sentiment of the season. Anderson Tully Co.
Memphis

ATCo MEMPHIS SOUTHERN HARDWOOD LUMBER & VENEER

ture furniture and household necessities and to operate sawmills, planing mills, etc. The capital stock is $40,000. and the head office is in Toronto. Among the incorporators are Thos. H. Hancock, Ernest R. French, Benjamin R. Jones, James E. Booth and M. R. Virtue, all of Toronto.

The Society of Graphic Arts, recently held a meeting at which the subject of commercial design, particularly furniture design, was discussed. A. H. Robson, the president, stated that he had been in touch with several of the larger furniture manufacturers and was informed that they were forced to go to Grand Rapids for their designs and that the furniture industry would welcome the development of a school of Canadian designers who would bring out what might be termed "Canadian designs." It was the consensus of opinion that this phase of applied art should receive greater attention.

Shurly-Dietrich Co., Limited, Galt, Ont., staged a saw tooth guessing contest at the Made-in-Galt Exposition, held recently in that city. They showed a coil of ½-inch band saw blade and offered a number of prizes for those who came nearest guessing the exact number of teeth. The correct figure was 22,012, The prize-winning guess was 22,016, the second prize was won by 22,001, and the third 22,000. This contest aroused a considerable amount of interest and was the means of getting $75.00 for the Galt Hospital. The guesses submitted ranged all the way from 456 to 45,000,000.

Fire broke out recently in the lumber yards of Reid & Co. at the foot of Berkeley St., Toronto, and did damage to the extent of $20,000. A two-storey galvanized iron building, containing the planing mill equipment and a quantity of lumber was wiped out as well as the dressed lumber shed immediately to the south in which a considerable stock was stored. The flames also spread to the lumber piles adjoining and did damage to about 100,000 feet. To the north of this the major portion of the lumber of the firm was piled and fortunately the wind was blowing to the south. The head of the firm J. B. Reid, left last month for St. Petersburg, Florida, where he is spending the winter. For the past two years the business has been managed by his son,Capt. G. T. Reid. It is thought that the blaze broke out either through strangers smoking or by an electric wire proving defective.

"The Band Saw" is the name of a small book issued recently for filers, sawyers and woodworkers, by the Simonds Canada Saw Co., Limited, Montreal, which is affiliated with the Simonds Mfg. Co., of Fitchburg, Mass. This book gives the brief outline of how band saws are produced, and contains practical information covering such important operations as rolling and tensioning, levelling, brazing, fitting and running small band saws, band saw speeds and strains; how to tension a band saw, and other information of a similar nature. In compiling this book, the Simonds Company have endeavored to set forth in a clear, concise manner practical suggestions and information based on the best practice as found in woodworking plants, with the idea of assisting all who have to do with the upkeep of band saw blades. They have undoubtedly succeeded in their effort, and a copy of this book should be in the hands of all band saw users.

Robert McLaughlin, founder of the McLaughlin Motor Car Co., and the McLaughlin Carriage Co., passed away recently at his home in Oshawa, Ont. He was in his 85 year and was one of the best-known manufacturers in Canada. Early in life Mr. McLaughlin took up the calling of a farmer, but his heart was not in this work. In 1869 he built a carriage shop at Enniskillen. In 1879 his business had grown to such an extent that he found it necessary to move to a railroad centre and selected Oshawa as the home of his new industry. From that on his business grew and developed. In 1889 he adopted a wholesale policy and in 1893 his two sons, George and R. S. McLaughlin, were taken into the business. 1907 witnessed the founding of the McLaughlin Motor Car Co. Later on the carriage plant was sold to Carriage Factories, Limited, while a second organization, known as "The Chevrolet Motor Co. of Canada Limited," was formed. Mr. McLaughlin did not confine his attentions entirely to business and industrial matters but took a great interest in Canadian and international affairs.

Book on Wood Turning

"Art and Education in Wood Turning," is the name of a text book recently published by the Manual Arts Press, Peoria, Ill. The author Wm. W. Klenke, is not only an expert turner but has a keen appreciation of that which is beautiful and as a consequence we find that his book deals with turning from both the practical viewpoint and with an eye to beauty in line and form.

This book offers complete detailed information regarding the use of wood-turning tools, their care and how they are kept in cutting order. The use of each tool is illustrated and described; for example, one section heading is "The skew used for smoothing cylinders," another "The skew chisel for V's and beads." Another interesting feature is the illustrations which outline designs for floor lamps, smoking stands, lamp standards, candlesticks, croquet mallets and various problems in wood turning. The price of this book is $1.40.

Study Merchandising Methods

At a recent meeting of the Furniture Manufacturers' Association, a committee was appointed to consider the question of the better merchandising of furniture. The plan is to make a detailed study of the merchandising methods of other leading industries with a view to bettering the methods in vogue in the furniture field. It is believd that much good can be accomplished along this line.

To Urge Standard Designs

The standardization conference, called by the National Lumber Manufacturers' Association met recently in Chicago to urge the adoption of standard sizes and standard designs for yard stocks and stock mouldings. The designs and sizes as recommended at an earlier meeting of the standardization committee were published in the "Canadian Woodworker and Furniture Manufacturer" some months ago.

When buying a band saw remember that the smaller the wheels which move the saw the greater is the bend on the saw. The more it is bent the sooner it is worn out.

When the teeth are all gummed up, put a little paraffin on them—then you can brush off the gum.

Your Protection—
Our Guarantee

THE KRAETZER-CURED LUMBER CO.

Stamped on
Every Piece

The Economy of the Obvious

When you buy gum that is stained you are buying in the dark.

This graded, but stained gum arrives at your factory and is worked up into your own particular product.

Then comes the reckoning

From your plant superintendent comes the report that of the last delivery of gum such and such an amount had to be discarded because of dote, some more because of check, and more, perhaps because of wormholes.

All this because neither you nor the grader could see the defects—defects covered by the stain.

The Obvious Gum

When you buy KRAETZER-CURED GUM you know what you are getting. Each piece is bright and clean, and free from stain.

All stained gum is dotty or rotten in the interior of the piece—much of it so badly as to entirely unfit it for use.

Can your scratch-pad figures prove any real economy in buying stained and incorrectly graded gum when clean and correctly graded KRAETZER-CURED GUM can be purchased at a great eventual economy?

Write or wire to us for quotations.

The Kraetzer-Cured Lumber Co.

Information and Inquiries

You are cordially invited to make use of this department

Duty on Veneers

Dec. 2nd, 1921, Indianapolis, Ind.

Editor, "Canadian Woodworker,"

Could you give us any information as to what the duty is on mahogany veneer and lumber entering Canada, and if there is any import duty upon logs, rough or partially manufactured; also if there is a band sawmill in Toronto or if not, the nearest point at which one is located.

Sincerely yours,
Lumbermen's Finance Corporation.

The duty on veneers up to 3/32 inch in thickness in such woods as mahogany, rosewood and Spanish cedar, is 7½ per cent. In all other woods up to 3/32 inch, the duty is 15 per cent. Over 3/32 inch, it is considered as lumber and enters Canada duty free. Logs, lumber and partially manufactured stock, i. e., lumber dressed one side and one edge, enters Canada duty free, while any material manufactured further than this state carries a duty of 25 per cent. These duties are based on Canadian funds, plus an import tax of 3 per cent.

There is not a band mill in Toronto, the nearest being probably at Midland, Penetang or Sarnia. Some of the larger planing mills in Toronto, operating 7 and 8-inch band resaws, might be able to handle the cutting you have in mind.

Stock for Inlays

Nov. 22nd, 1921, Winnipeg, Man.

Editor, "Canadian Woodworker."

Can you tell me where I can secure inlays and stringing 3/16 wide, white with black centre? Any information you can give me, will be appreciated.

Sincerely yours,
Peter Murphy.

You can secure inlays and marquetries of various kinds from T. Bernard & Co., 422 East 53rd St., New York. They carry a very complete stock and should be able to supply your requirements at short notice. It is not very difficult to make a plain white and black inlay, such as you describe, and by gluing up three thin pieces of wood, two outisde ones white and centre one black, in panel form, and then cutting strips from the edge, you have the inlay you desire. If you find it difficult to secure a black wood, you can take one of the softer white woods and color it with some suitable black dye. However, if you need some fancier inlays or stringing, it would pay you to purchase your requirements.

Special Automatic Lathe

Camrose. Alta., Nov. 26th, 1921.

Editor, "Canadian Woodworker,"

We would like to secure an automatic machine to manufacture a small toy. The article consists of two pieces, the largest of which is 6 inches long and ¾ inch in diameter, the other piece 2 inches long and 1 inch in diameter. Both pieces require to be turned ed and bored. If you can help us in this matter, we will appreciate your co-operation.

Sincerely yours,
E. Haines.

The automatic equipment used for turning bales or handles for bales should about suit your requirements. This machine turns and bores from each end at one operation. Would suggest that you get in touch with either one of the following firms:—Lewis T. Kline, Alpena, Mich. or A. D. Waymoth & Co., Fitchburg, Mass.

Wheels for Tea Wagons

Davidson, Sask., Nov. 5th, 1921.

Editor, "Canadian Woodworker,"

Can you tell me where I can secure rubber-tired wheels and castors for tea waggons, also cane bottoms for chairs.

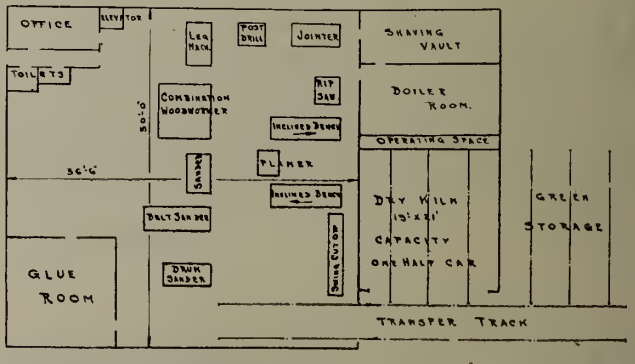
Thanking you in anticipation, I am,
Yours truly,
W. H. Blair.

We believe that you can secure the rubber-tired wheels and castors from the Faultless Castor Co., Evansville, Ind. The cane seats may be had from the Overseas Reed & Cane Co., Ionia, Mich.

Layout of Furniture Factory

Replying to the enquiry which was submitted by H. L. N. which was published on page 114 of the November "Canadian Woodworker," I offer the following suggestion:—

In properly laying out a small furniture factory there are many phases of local importance to be taken into consideration, which can only be determined by the owner. However, there are a few standard rules



which should be instituted if possible. In the above drawing the writer has endeavored to incorporate a few details which will lessen the up-keep, cost of production as well as reduce the initial cost of the building.

You will note I have suggested a change in the location of the boiler room. The object in doing this is two-fold,—first we can make the outside wall serve as the end wall of the dry kiln cutting down the cost of an extra wall; secondly, usually in a small factory of this size, the engineer also operates the dry kiln, so by placing the dry kiln operating room in the boiler room we have placed the valves, traps, damper controls, recording instruments, etc., in a spot where the engineer can give them his best attention. This ar-

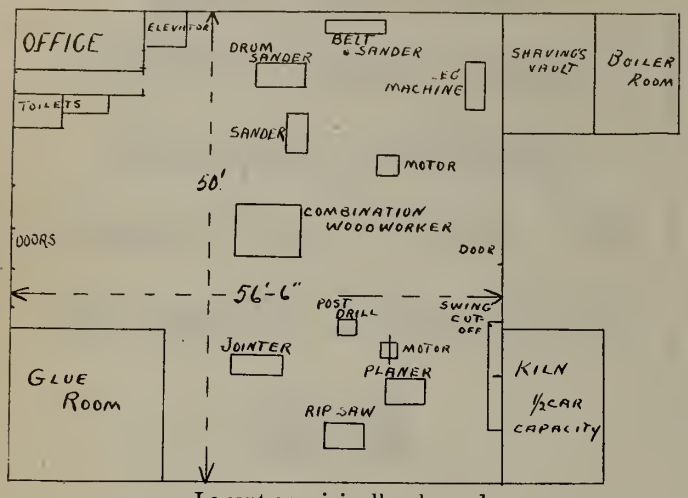
rangement also places the kiln feed and drain lines to the nearest point to the boiler.

The kiln itself is a cross piling dry kiln holding three 6 ft. trucks, each with a capacity of approximately 3 M feet, or a total kiln capacity of nine to ten thousand feet. In conjunction with the dry kiln, I suggest a green storage track which will accomo-



Layout as originally planned

date the same number of kiln trucks. With such a system this green storage track can be kept loaded at all times so that when the kiln is unloaded no time will be lost in refilling. A dry storage shed also should be included as lumber should be allowed to cool off and even up before going from kiln to the machines.

In placing the machines I have tried to arrange them so as to keep the lumber progressing through the numerous processes without back tracking. Just which machine follows the preceding operation altogether is determined by the requirements of this particular factory, as it is very seldom that two factories can have the same arrangement of machinery and both work out with equal success. So in this drawing I have not set up these machines in perhaps just the alignment which may be required but the general principle works in all cases.

In a small factory of this size the machines could be operated from one drive shaft down through the center. However, I have left room that two shafts could be installed if there is any particular reason for so doing. The arrangements of work benches can be so planned as to aid in the reduction of loss labor in handling the stock. All door openings will be contingent upon local environments.—C. A. Fields, Toronto.

Furniture Factory Layout

It is rather difficult to size up a layout for a furniture factory without knowing the lines to be manufactured and the output contemplated. I do not think much of a combination machine as a piece of production equipment in a plant of this kind. It is ideal for a contractor to set up on a job and do odd bits of machine work, and it is also very handy for a small woodworker who has not sufficient work to warrant the installation of individual machines, but where the volume of work going through is large, the combination machine is not suitable. In its place you might find it a good investment to instal a variety saw, single spindle shaper and band saw.

Another suggestion would be with regard to dry kiln facilities. Taking into consideration the fact that your business is likely to grow, would it not be wise to provide adequate dry kiln facilities to take care of any reasonable increase in your drying requirements. With a kiln holding a half car of lumber you can hardly figure on drying two lots a month which would mean that your production may be held down because of the fact that you would not be able to dry lumber in excess of 15000 or 16000 feet a month. It might be a good suggestion to instal a two-compartment kiln, each compartment having a capacity of half a car. If, at the present time, you do not need more than one car of dry material per month, you can use the other compartment as a dry storage and cooling room. This is a very necessary adjunct.—H. A. H.

Furniture Prices Investigated

Dr. Hastings, thte medical health officer for Toronto, recently completed an investigation into the prices of furniture. This was in connection with the reports he is making on the high cost of living. Dr. Hastings found that furniture prices had dropped on an average of 30 per cent from the peak, the reductions varying according to the nature of the article and the workmanship and design of the piece.

In some cases, especially with regard to the highest grades of furniture, where labor is one of the largest items involved, the reductions ran from 5 to 10 per cent. On the other hand, he found that certain close-outs or distress lines were being sacrificed at a reduction of 50 per cent. He gathered figures from both the manufacturing and retail branches of the industry, and it appears as if the furniture manufacturers have put into effect a greater reduction than have the retail dealers. From the figures gathered in the retail field, the average reduction varied from 23.3 to 17.7 per cent, while in the manufacturing end the reduction averages close on 30 per cent.

It was brought out that furniture costs at the present time are considerably higher than they were in 1914, labor being 90 per cent higher, lumber 82 per cent, plate glass 50 per cent and tapestries 65 per cent higher than in 1914. These figures represent a reduction from the peak prices of 1920 as follows:—wages 15 per cent lower, lumber 35 per cent lower, plate glass 30 per cent lower.

Dr. Hastings reports that it is not likely that furniture prices will go much lower, in fact from what he could gather, it is more than probable that there will be a stiffening of values in certain lines. This is just in line with the general impression held by all who are in close touch with this industry.

Publicity Bureau Changes Name

The Furniture Publicity Bureau, which was organized to handle the advertising campaign of the American furniture manufacturers, has changed its name to the "American Homes Bureau." This was done primarily to permit of a more universal appeal and also to remove any doubt which might arise as to the motive underlying this movement. It is thought that the new name will remove any taint of commercialism which might happen to be raised were the name "Publicity Bureau" retained.

Quick Action Vise

Modern equipment is essential to progressive manufacturing. One of the items that has undergone considerable improvement and development during recent years is the humble bench vise. The old type, with either wood or steel screw, which had to be tediously turned in or out, has been replaced by the modern style of quick-acting vise. With this latter design, a half-turn of the screw either releases or locks the nut on the screw. In this way the jaws of the vise can be opened or closed with extreme rapidity. The accompanying illustration shows, in detail, a type of quick-acting vise which has been placed on the market by the Globe Vise & Truck Co. of Grand Rapids, Mich. It will be noticed that there are no delicate castings to give trouble, every part being built to stand a considerable amount of wear. The screw is made of 1 ⅛ in. carbon steel with threads cut away longitudinally, permitting a free movement of the screw backward and forward, giving a quick reliable action with a sure grip when pressure is required.

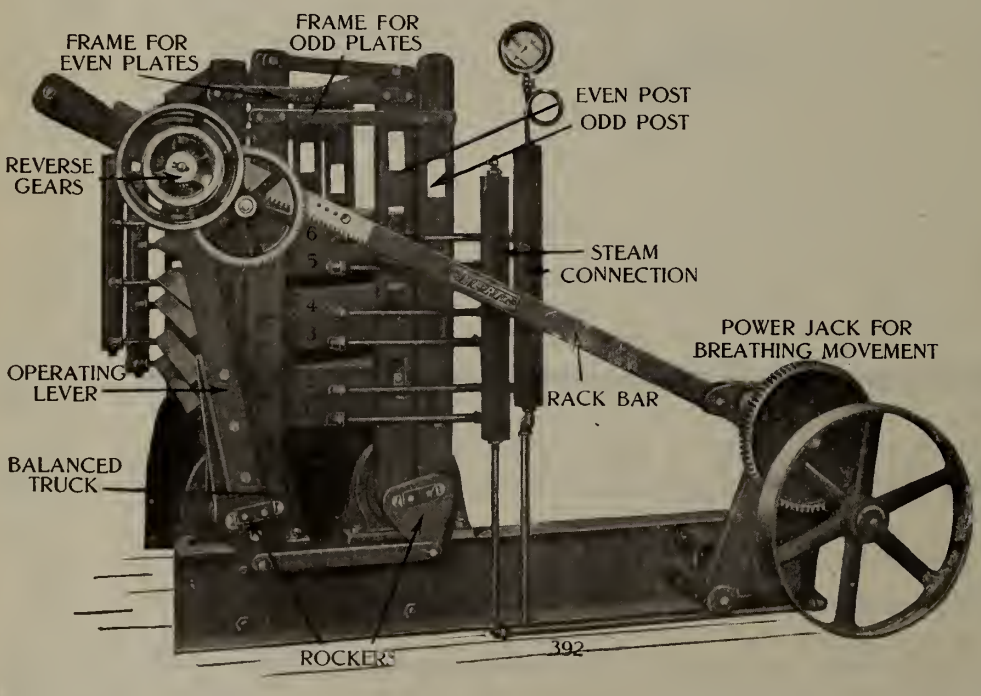
Cutting off the advertising may reduce your expenses, but so does cutting your windpipe reduce the cost of living.

Closer Attention To Fine Circular Saws

It is a well demonstrated fact that every mill or factory, whether devoted to the manufacture of lumber, shingles, staves, heading, veneers, etc., or to the production of boxes, furniture, sash, doors, and blinds, or to general planing, turning and wood finishing connected with any line of manufacture—will find the use of finely fitted saws a prime necessity to successful work, says a writer in "Hardwood Record." Factory saw fitting deals with a different kind of work, and laso a different class of saws from sawmill work, in that there are in use small bands, band resaws, circulars for ripping, resawing and cross cutting, which are expected to cut smooth and clean on a very small kerf to a line, and stand good feed, also scroll saws and the great variety of knives, cutters and bits that are found in the equipment of every extensive plant.

In the fitting of factory saws there are the same essentials to first class work as in the sawmill; namely, the right hooks and pitch of teeth, the right throat room, the right tension, the right fitting of the cutting points, the absolute roundness of the saws, the proper feed of the timber to just meet, but not exceed the capacity of the saw and the construction of the sawing machine itself. The most exact and up-to-date fitting will fail to accomplish satisfactory results on poor machines, neither will the very best machines give good results on poorly fitted saws. I am not going into details on how to fit the tension band resaws and round saws, but I will, however, give my opinion on a small scale on round saws in connection with the rest of my article.

Be enthusiastic! In every battle of life—be it business or football, service or sport—the man with enthusiasm always wins the support of the crowds. No matter what you are attempting to do, be the cause worthy, the element necessary to bring success, is enthusiasm.



VENEER MERIT MACHINERY

Chicago City Drawbridges

Fifty movable highway bridges are maintained by the city of Chicago, the different types being as follows: 24 trunnion bascule bridges, 12 centre bearing swing bridges, 12 rolling lift bascule bridges, one vertical lift bridge and one pontoon bridge. Of the trunnion bascule bridges, 22 are of the type developed by the city and the others are of the Strauss and Page & Schnable types. The pontoon bridge is across the Calumet River at Torrence Ave.

35 Per Cent. Gain in Asphaltic Pavement Yardage

Reports from U. S. city engineers to the Asphalt Association, New York, show that over 30,000,000 square yards, or 1,750 miles of asphaltic pavement, 30 ft. wide, will be laid on city streets this year. Reports from state highway departments indicate that 23,000,000 sq. yd. will be laid on the state highways, while the area laid in counties and other districts will bring the total to 65,000,000 sq. yd., or 3,690 miles of asphalt pavements 30 ft. wide. This will be an increase of 35 per cent. over the yardage in 1920.

New Bridge for Sydney, Australia

Specifications to cover the design, construction, and erection of the Sydney (Australia) Harbor North Shore Bridge are expected shortly by the U. S. Bureau of Foreign and Domestic Commerce from Trade Commissioner A. W. Ferrin, and upon their receipt copies will be placed on file in the Bureau's New York and Chicago offices, where they may be consulted by interested persons.

The bridge will consist of nickel-steel cantilevers supporting a central girder section, also constructed of nickel steel, spanning the harbor between Dawes Point and Milson's Point. Each anchor or shore arm will be 500 feet long, the harbor or cantilever arms will be 520 feet long, while the central section is to be 560 feet long, thus making a span of 1,600 ft. from centre to centre of the main supporting piers and a total length of steel work of 2,600 feet. Between the main girders, which are 94 feet 6 inches apart, provision is made for four lines of electric railway and a roadway 35 feet wide. Outside the main girders on the east side is a motor roadway 18 feet wide between the handrails, and on the western side a footway 15 feet wide, the railways, roadway and footway being all on the same grade. A headway of 170 feet above high water is provided for the central 600 feet of the bridge, with a clearance of not less than 156 feet over the whole fairway.

The Sydney Harbor bridge will thus have five feet greater span and 35 feet more headway under the centre than does Brooklyn Bridge, and will have a span only 200 feet shorter than that of the Quebec Bridge, but with a headway 20 feet greater. The estimated cost of the bridge is £6,000,000, and the work is expected to extend over eight and a half years.—Commerce Reports.

Harbor to be Deepened

The London & North-Western Railway Company have contracted with the Tilbury Contracting & Dredging Company, Limited, of Westminster, England, for the deepening of the harbor at Holyhead. This work, in addition to a large amount of ordinary dredging, comprises the removal of nearly 200,000 tons of rock, on which the most up-to-date type of rock-cutting plant will be used.

Decrease in Building Activities

There was a notable increase in building activities in Argentina during the first half of the year, the total construction for the first six months of 1921 amounting to 62,240,000 paper pesos, as compared with 30,900,000 paper pesos during the same period of 1920. The month of June, however, witnessed a decline in building operations and it is claimed that the recent rent legislation will have a further tendency to reduce the construction of new buildings.

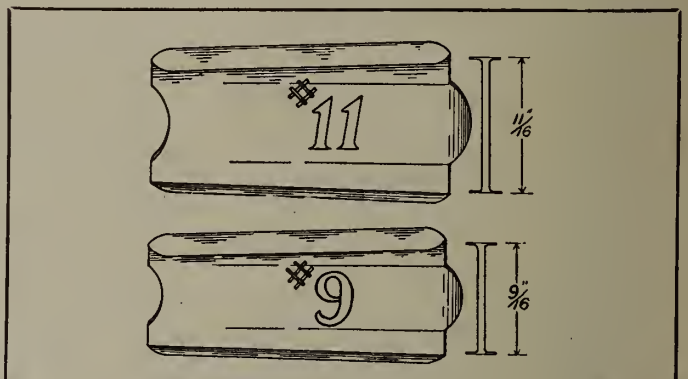
Clamp Nails Reduce Costs.

"A joint made up with clamp nails may be placed in boiling water and dried in a kiln. It never lets go under any conditions." This statement may be verified by any of the numerous users. The use of clamp nails forms a present day method of construction that is unique, but which has been thoroughly tried, tested and generally adopted by the leading furniture and casket manufacturers as a necessity in the production of many desirable features of construction. In addition, it meets economical features as can be done in no other way. Clamping (the bugbear of all mitered work) is entirely eliminated. Clamp nails, as their name signifies, do their own clamping.

About eighteen years ago, J. T. Richards, who is now President of the Chicago Casket Company, Chicago, Ill., conceived the idea of assembling casket lid mouldings in frames and then drawing up the



Showing projection for easy starting and recess for setting

joints with clamp nails. Mr. Richards no doubt is the father of this idea, and it is estimated that since that time he has purchased forty odd tons of these nails for the different firms with which he has been connected.

The greatest economy is only practical when the work is properly done, by which is meant a study of this method of joinery and becoming familiar with these nails and their uses. Mitered joints are much to be desired in the construction of any work and when made up with these nails they are superior to those made with wooden splines, dove-tailing, dado jointing, mortising or doweling, and are more economical as they often show a saving of as high as 50% in assembling costs. The joinery of table rims, piano benches, frames, domed tops for phonograph cabinets, casket lids and bodies are only a few suggestions of what can be accomplished by this method.

The nails, as illustrated, are made in various lengths and widths to accommodate any type of construction and have recently been improved by a projection on the lead end for easy starting and driving and a recess in the driving end for setting the nail without any danger of marring the surface of the work. In using clamp nails a saw-kerf is made as in the use of the wooden spline, but in this case a 20 gauge saw is used and this sawcut just fits the shank of the nail.

The manufacturers of these nails, through a knowledge gained by many years of experience, are in position to assist in the working out of particular construction problems and it is their desire to co-operate with the users to this end. This practical and economical method is well worth looking into.

CIRCULARS and SAMPLES ON REQUEST.

Do not guess or estimate whether you have run enough th ough the moulder to fill the order. KNOW!

The Productimeter

This is a lumber meter that tells you all the time exactly how many feet have been run through on any job. Good big figures right in plain sight.

It is automatic—never tires—never forgets—never slips—never spins at the end of the board.

It saves its cost, over and over, in lumber, time, labor and power.

Try One 30 Days—Free.

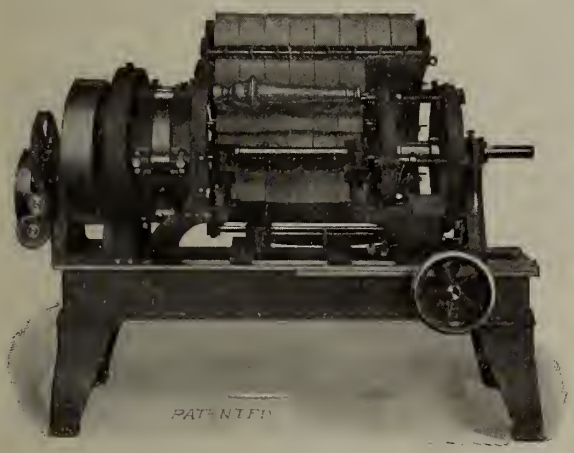
DO YOU KNOW



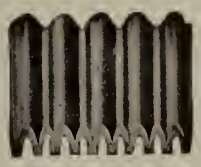
what it is costing you to sand your furniture and chair turnings by hand rather than on a Nash Sander?

If you don't it is high time you gave this matter serious thought.

Now is a good time to look into this.

J. M. NASH, Milwaukee, Wis.

Cary's SUPERIOR QUALITY Corrugated Fasteners



SAW EDGE

PLAIN EDGE

According to final decision, after long litigation, we have been granted the SOLE RIGHT to manufacture a Saw Tooth Corrugated Fastener with a continuous cutting edge. Our fastener is beveled evenly on both sides, which enables fasteners to be driven in straight, and much easier than any other fastener made. Our Corrugated Fastener is made in various widths and corrugations, also in coils wound right and left. Try our products and you will use no other.

Samples and prices on request.

BUILT right into Carborundum Brand Garnet Paper and Cloth are those vital qualities of clean, fast cutting, flexibility, long life and uniformity. Everything that goes into their making is of the highest possible standard. The grain is pure, sharp, North River garnet. The glue is of the highest grade of just the proper viscosity. The backings are of the best Fourdrinier rope stock, jeans and drills. And built right into the finished product are those qualities that prove that

QUALITY

QUALITY is a watchword—a symbol—a guiding factor in the making of Carborundum Brand Garnet Products.

It is never forgotten all through the process of manufacture, from the selection and testing of the hard, sharp, pure, North River Garnet and the superior backings and glue, to the inspection of the finished products.

Quality is an obsession with us because it is the thing upon which we have founded a reputation in the wood working field.

And this quality is reflected in clean, free-cutting paper or cloth that is uniformly coated, flexible, when flexibility is required, and long-lived always.

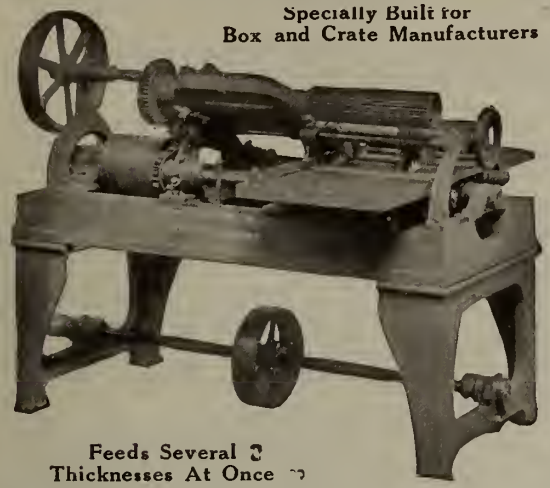
"The Chattanooga" — Just Another Name For Fast, Economical Gang Ripsawing

Specially Built for Box and Crate Manufacturers



Feeds Several Thicknesses At Once

This latest improved gang ripsaw is powerful, fast, safe and eliminates wastage. For gang sawing boards into strips or head sticks and for ripping veneers it is unsurpassed.

Has powerful feed and securely holds down and feeds short pieces. The feed rolls are automatically adjustable to varying thicknesses. Upper rolls are driven by cut gears, and the lower ones by sprocket chain. Several thicknesses of veneering can be fed thru machine at one time.

The CHATTANOOGA is an unusually big producer, easily operated, and turns to profitable account short stuff lying around a mill—otherwise wasted.

Attractive price. Complete information on request

Chattanooga Machinery Company

THREE GUESSES

Is it economical ?

Is it the right type ?

Is it the right size ?

Electric power, heating, lighting and equipment problems are to be found in the woodworking industry.

Perhaps your output can be increased? You are, perhaps, losing electrical energy by wasteful types of motors? Are your switches and wiring devices up-to-date or are you in continual danger of fire?

We shall be pleased to answer any questions or help you with any problems whenever you care to write us.

A Sound Boiler - Like a Sound Heart

Will pull its owner over many a hill. An out-of-date, wasteful, under-capacity Boiler should be changed now for a modern, efficient Boiler such as we make, because our prices are surprisingly low and our service good.

BEAVER DADO

"Beaver Dado"

"It has the old style beat 100%"

208 Monmouth Rd.,
Walkerville. Ont.
Nov. 2nd 1921.

Radcliff Saw,
Toronto, Ont.

Dear Sir:

I shall be much obliged if you will forward C. O. D. at your earliest
1 Rip Saw with dia 10" Bore 1" sharpened and set ready for use

I am uncertain about gauge, but I should say it ought to make a cut about 1/8" or rather allowing 1/8" for waste.

The **Dado Head** reached my highest expectations. It has the old style beat one hundred per cent.

Trusting you will favour me with prompt service,

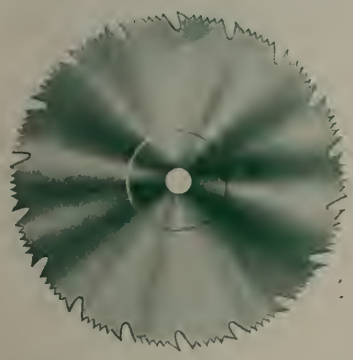
I am

Respectfully yours,
(Sgd.) Walter Coek,
C.3.

Tell us your Saw Requirements.

Radcliff Saw Manufacturing Company, Limited

1550 Dundas Street West **TORONTO, ONT.**



100% Production

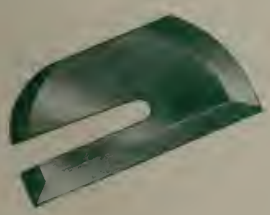
will be necessary to meet the demand for all wood-working material and furniture that will be required for the 4,000,000 buildings that must be erected in 1921.

ATKINS

STERLING QUALITY

SAWS and KNIVES

will make it possible for you to meet this demand in producing your share.



The high grade material and expert construction of Atkins Saws and Knives make possible the superior service they render.

Let Their Efficient Performance Tell You the Atkins Story of Perfection.

Write to-day for our Knife Booklet "CW" and Pattern Template Paper.

E. C. ATKINS & CO., ***Makers of Sterling Saws***

Factory—HAMILTON, Ont. **Vancouver Branch—109 Powell Street**

One Man Shapes and Finishes Queen Anne Legs

The manufacturer of Queen Anne styles can now produce the legs at exceptionally small labor cost. One man can look after the automatic leg-forming lathe in connection with the operation of the belt sander or other machine; or as many as four of the lathes can be handled by one man, because the cutting operation is purely automatic.

Pneumatic sanding drums supply just the right resiliency for cleaning up the extreme curves

FOR your beautifully designed cabriole patterns there is no other machine so well suited as the Mattison "214" Automatic Leg-Forming Lathe. It is specially designed to produce the irregular-shaped Queen Anne legs accurately and at a minimum labor cost. The cutting operation is purely automatic which reduces the labor to the actual time required to change stock. The man who tends the lathe can sand a leg on the "115" Belt Sander while another is being cut in the machine.

The Combination Makes an Efficient Method

Sanding flat curves against cushioned sanding roll

The flexible open belt nicely finishes the rounds

BY free-hand manipulation of the leg diagonally against the open sandbelt, shaped forms or cushioned sanding rolls, the rough sanding is accomplished very quickly. The two sizes of pneumatic sand-covered drums provide a most practical and accurate method for perfectly finish-sanding the legs. This combination of both rough and finish sanding operations in the one machine together with the lathe for automatically shaping the legs, gives the manufacturer of Queen Anne furniture a method that minimizes costs and insures accurate production of his individual and distinctive patterns.
